In D. P. J., p. 381, Gillomer (Giolla 'or) is made King of Leinster, while in eating's Introduction to his History (Mr. myn's Keating, pp. 13, 49), Giolla Mor made King of Ireland, and son to the ing of Thomond; consequently a bril- nt light will now be cast on the origin Stonehenge, for Giolla Mor of Cahir- illamore was an avatar of Gar (Sanskrit ar, "to shine"), and may be equated th Fer Fi, son of Eogabal, and fosterson Manannan, the Irish god of music and ng, and it is curious that beside the ke named from the Irish god of music is buried Thomas O'Connellan, the fore- st bard and minstrel of the Irish, whose ath song was sung by the Irish Diana, ter of Fer Fi. Old men have told me at they often heard the ceolsidhe, or 'airy music," from the lake of Gar, but ether this be so or not, the Dublin nolars who have turned their backs to the d things of Ireland will have to face e music of the Iberian harp and the fire the Iberian guns, for the Iberian battle- g is unfurled and the sword of light is awn.

Dr. Joyce (Irish Names, vol. i., p. 182) rs that several fairy hills in Ireland were med from Bodb derg and his daughter igh, but Bugh appears to be a corruption m of Bodb. Professor Rhys thinks at the name of the goddess Bodb is gnate with Anglo-Saxon beadu and Norse d, "war or battle," and he refers to the ulish names Bodvogenus and Bodvogna- s (Cæsar, Bell. Gall. ii., 23). Keating rs that Badb (Bodb), Macha, and Morrio- an, were three goddesses of the Tuatha Danann. O'Donovan (Battle of Magh ath, p. 198) says that Morrioghan, or orrigu (great queen) was the Bellona of e Irish; and Professor Rhys is inclined identify Bodb with Morrigu. In Tog- il Bruidne Da Derga, the swineherd of db derg of Sidh Femin is named Nar, d in Bodleian Dinnshenches, p. 21, the ineherd-champion of Bodb of Sidh Femin named Rind, and is said to be a rebirth the white-horned bull of Magh Ai, or lain of Ai." O'Reilly has fem, femen, eaning woman, with which it may be gnate and not derived from Latin femina. . Henderson ("Feast of Bricriu," p. 8) has following gloss: femen-i-bean, ach ba femen ba feindidh, "femen, i.e., man, though she was a woman she was a rrior." Magh Femin may have been named with respect to Aeife, daughter of Ugaine Mor, who obtained the plain.

In William Hackett's note (Trans. Os. Soc., vol. v., p. 166) we read: "The Righ bhean a bruit dirg, the Queen with the red robe, flourishes in the story of Fahalay, but our information is defective concerning her."

Righ bhean is the same as Rioghain, and in Trans. Os. Soc., vol. iv., p. 87, Niamh Nuadh-chrothach, daughter of Garadh, son of Dolar Dian, Ardrigh of Greece, is termed Rioghain an bhruit dheirg ("queen of the red robe"), and it is said that she, having been bound against her will to Tailc Mac Treoin, or "Stout-one son of Powerful-one," sought refuge with Finn and the Fianna, then assembled on Cnoc an Air, or "hill of slaughter," considered by the editor of "Cath Chnoic an Air" to be Knockanar, near Ballybunion, county of Kerry. There was also a Cnoc an Air near Ros na righ beside the River Boyne (Silva Gadelica, p. 137), and Ros na righ was also the name of one of the royal residences of Munster (Silva Gadelica, p. 118). I do not know where the Munster Ros na righ was, but have some reason for supposing that Ros was the celebrated "Wood of Bones," near the town of Tipperary, and that the fort of Ros na righ was on the site still visible on the largest of the Round-hills, about a mile and a half east of the town. In Silva Gadelica, p. 178, it is stated that Niamh, daughter of Angus tireach, or "land-grabber," eloped from Dun na m barc, or "fort of ships" (now Dunnamark, near Bantry) with Oisin, son of Finn, and went with him to Tulach na narm, or "hill of arms," in Magh Rath, or "plain of forts" (now Moira, county of Down). It is stated that Niamh died on this hill when beholding the slaughter (ar) of the battle fought between the Fianna and the forces of Augus tireach, and that the hill was consequently called Cnoc an air, which appears to be the hill named Cnocan an Choscair, or "hillock of slaughter," or victory, in "Battle of Magh Rath," edited by O'Donovan. In "Laidh Oisin ar Thir na n-og," Niamh Chinn Oir, or "Brightness of the head of gold," appears to the Fianna beside Loch Lein (Lakes of Killarney), and entices Oisin to Tir na n-og, being, it is said, daughter of the King of Tir na n-Og. They go on the back of a white horse, and after leaving Erin see many wonderful sights. They see a white, red-eared dog (gadhar) chasing a hornless fawn (Eilit mhaol), and a young mamid on a brown (donn) steed having a golden apple in her right hand going on the top of the wave closely followed by a young rider on a white (ban) steed, under a purple crimson (corcur dearg) satin mantle, and a golden-headed sword in his right hand. Niamh will not inform Oisin what the meaning of these sights is, and advises him not to heed what he sees. Oisin is stated to have lived over three hundred years with Niamh in Tir na-n-og, and when he returned to get a look at Erin and the Fianna he found the land not what it was, and the Fiann dead long previously. In Gleann an Smoil he lifted and cast to a distance a large flag which some men were endeavouring to raise, and then the golden girths of the saddle of the white horse broke, and Oisin having touched the soil of Erin, became at once blind, weak, and feeble.

In O'Curry's Lectures, p. 39, Fedelm Nuachtrutach is explained F. of the ever new form, or ever blooming, and at p. 514, the form Fedlem Nochrothaigh occurs, which O'Curry explains F. of the ever new beauty. Professor Rhys ("Hibbert Lectures," p. 630) has Fedelm of the Nine Forms, for she had so many fair aspects, each of which was more beautiful than the others." In the "Feast of Bricriu," p. 34, the name occurs as Fedelm Noicrothach ingen Conchobair, and is explained "Noi crotha no tadbantais forri ocus ba aildiu cach cruth araili." Fedelm of the nine shapes, daughter of Conchobar—"nine shapes she could assume, and each shape more lovely than the other."

Fedilmi (Fedlem, Fedelm) is explained by O'Donovan (D. P. J., p. 373) as "ever good," but the final letter m of this name is an example of Celtic mimation, and the name is an extension of Feidel, or Fedel. Fedlem, or Fedelm, may be explained as brightness, and Niamh and Fedlem have exactly the same meaning and have the same mythological explanation. Niamh Nuadh-chrotach, or Niamh of the ever new form, may be Niamh Noicrothach, or Niamh of the Nine Forms. Professor Rhys says "Fedelm, according to some accounts, was the mother of Erc and Acall, nor is she usually associated with Cu Chulaind; and she is so abruptly introduced into the epic tale that the passage was a puzzle, some eight hundred years ago, to the writer of the oldest text now known of it. But, treated comparatively, it becomes intelligible, and carries us back to a distance of time which might almost be characterised as geological" ("Hibbert Lectures, p. 631).

Professor Rhys ("Hibbert Lectures," p. 378) thinks that the "Nine Forms," like the "Nine Hazels," had reference to the nine-night week of the Celts, and he compares the Irish Fedelm with the Greek Athene.

(To be Continued.)

A WISH.

By C.

Oh! give me the ocean's boundless plain,
And a barque to plough its wild, wild waves;
Give me the mirth of the tameless main,
As it roars in might through its hollow caves.

And give me the voice of the viewless breeze
To whistle its song through my white-swelling sails,
And play in its glee o'er the billowy seas,
Alternate the sport or the prey of its gales.

Give me the star-studded diademed night,
With its myriads of glories unveiled to the view;
Or the mild maiden moon, with her silvery light,
Shining forth from a canopied curtain of blue.

And give me the freedom to ramble and roam,
And visit each region of sun or of snow:
The world for my country, my bark for my home,
Heaven's high arch above me, the ocean below.

Oh! give me but these, and I envy you not
Your sweet tranquil home, and its sameness of bliss;
I sue not for glory, or wealth, as my lot,
No—all I would ask is a life such as this.

OUR WEEKLY STORY

ABOVE THE RABBLE.

BY ELBERT HUBBARD.

The Eiffel Tower is one thousand feet high; it is the highest structure in the world. Next to this comes the Washington Monument, five hundred and fifty-five feet. The Great Pyramid is four hundred and eighty feet; the spire of St. Peter's at Rome is four hundred and thirty-two feet.

There are four elevators that run to the second landing of the Tower—two ascending and two descending. From this point there is one running up and one running down. In order to lessen vibration to the structure and to the vertebrae of passengers, the elevators move at the rate of only one hundred feet a minute; thus it takes ten minutes to make the ascent.

The second landing place is three hundred and seventy feet from the ground, and this is about as far from mother earth as most people care to go. The highest buildings in Chicago are about two hundred feet. From the roofs of these edifices the people below look like pigmies; the rattle of traffic is heard as a faint hum. But from the top of the Eiffel Tower men and women on the ground are lost to ken: they are mere dots, without height or individuality.

The Eiffel Tower is the greatest scheme for elevating humanity ever conceived. It costs five francs to make the ascent, but it is worth the money. It will try your nerves, and possibly make you seasick, but the joy you feel on getting back to earth is compensation for all discomfort.

Besides this, change in hygienic and nervous sensations, new experiences, new views of things. In fact, a specialist in neurotics of Paris takes certain of his patients to the top of the Eiffel Tower in order to arouse them out of their despondency—to stimulate and compel them to think of new things.

We have all heard of the chronic invalid who was not cured until the doctor caught a fire; but who wants to start a conflagration as treatment for melancholia? Yet the elevators at the Eiffel Tower run every day, and it has happened that when patients who seemed to commit suicide are taken up in the closely cushioned cage, they have become frightened and begged to be taken down at once.

Let me frankly confess that I was first attracted to the Eiffel Tower through the advice of a physician. I had overworked, endeavouring to read all of the chipmunk magazines as fast as they appeared. Nervous prostration set in, and neurasthenia had taken a firm hold on me, and if my actions at this time were slightly peculiar, the gentle reader must be charitable, and attribute my eccentricity solely to my physical condition—and the magazinelets.

I made the ascent of the Tower by stages: the first time I was fully satisfied on getting to the second landing. The next time to the third, and on the third ascent, I resolved the summit.

Had I gone but once, it would have been an experience never to be forgotten. Alas! the medicine was so palatable that I wished for a double dose, and on the second trip the Tower was only half as high. I was quite blase.

The work of the great engineer? What of it! He has the earth to build upon, the corners of the world from which to draw material, books that tell him the crushing resistance of his base and the breaking tension of his beams. He digs for his caissons, lays his foundation, places his steel uprights, counts on the force of the wind; computes the exact weight of each piece he will use, bolts and rivets part to part, carrying up columns and girders by elevator, and, like the building of a railroad, lays the track for his carriages as he goes. A railway extends iron after iron on the ground; this extends iron after iron into the air. But it is according to well digested physical laws; it is all geometric. The Tower has four immense corners three hundred feet apart that are mortised into the very crust of the Miocene Period. The pressure on each square centimetre at the base is nine pounds; that at the Washington Monument is fifty-eight pounds. The difference is in the material used. Who's afraid? There it rises, tall, straight, correct, cold-levelled with plumb-line and square. It is all mathematically adjusted, clamped, implicated, riveted, rectilinear, symmetrical, sure. It cost 1.500.000 dollars.

On my third passage to the elevator of the Eiffel Tower the novelty of the thing had quite worn away. I joked with the ticket-seller, slapped the guard on the back, entered the car, and patted several ladies who were a bit nervous, and threatening to scream; then I gave the order to ascend. My jaunty manner quite put the passengers at their ease. In pigeon French I explained the workings of the elevators, the cost of the structure, the time required to build it, the difficulties encountered.

On the down trip one of the ladies asked: "Who was it built this tower, anyway?"

"I am the man who built it," was my unblushing answer.

"But I thought from your accent you were an American?"

"Madam, you evidently forget that in building towers the vocabulary always gets a little mixed."

The next day as I viewed the Eiffel Tower from my hotel window, I smiled in derision. On first approaching the Tower a week before, I had been overawed, then I admired, then grew fond of it, then embraced—in my mind—to scorn it.

And this is how it happened: In the Paris edition of the "New York Herald" I read an announcement worded as follows: "Prof. Le Grand, the celebrated aeronaut, will make an ascension for scientific purposes to-morrow, from the Champ de Mars. Three passengers will be taken at fifty francs each. Apply early at 15 Rue St. Denis."

An overwhelming desire had come over me to spit down upon the pride of M. Eiffel. Here was the chance. I hastened to the Rue St. Denis, found Prof. Le Grand, a bright youth of about twenty-two, at a little wine shop. He was too young to be celebrated, and did not look scientific, yet I paid him my passage money and took a receipt. He could not understand my English, and to me his French was incomprehensible; but by signs I much patronized, it was agreed that I should be on hand at two o'clock the following day.

I slept little that night, and was up betimes the next morning. When I approached the Champ de Mars in the afternoon I could see the great mud-coloured balloon swaying back and forth like an impatient elephant. A large crowd had gathered. On working my way through the jam I found that ropes were stretched in the form of a square to keep people back. I managed to reach the ropes, dodged under, and was seized by a "John Darm." I shouldered him to one side, and just as he was about to draw his sword, Prof. Le Galligar rushed forward, all in spangled tights. He embraced me, and kissed me on both cheeks. He introduced me to the assemblage, first to the east, then to the north, then to the west, then to the south. The crowd cheered lustily.

Soon the other two passengers appeared. One was a tall, slim man, the other short and stout. They were embraced by the Professor and duly introduced, first to me, then to the crowd, east, north, south and west.

My shipmates were both Frenchmen, and spoke no English. I was neither frightened nor nervous, but still I had prayed hard that at least one of them might speak English. I wished to hear my native tongue before I left the earth.

But there was no time for disappointment. The Professor seized me by the arm, marched me around to the other side of the swaying basket, and pointed to the rope ladder. I consulted my watch; it was just two o'clock. I climbed up, and found that my colleague had preceded me.

On standing in the basket the top came nearly level with my shoulders. The tall man's head was a foot above mine, and the little duodecimo's a foot below—his face deathly pale.

The Professor perched airily on the edge of the basket, and gave orders to cast off. Then it was that the little stout man got his hands on the side of the basket and tried frantically to get out—he had changed his mind. The Professor slid down and grasped him by the legs, endeavouring to hold him back. I took a hand, too. We forced him to the floor, while all the time the crowd cheered.

Then there was a silence. I stood on the prostrate form of the fat man and looked over the side to see what this sudden quiet meant. Just then a shrill feminine voice came to my ears: "Why, that's the man who built the Eiffel Tower!"

I looked down and there, to the front of the crowd, was my friend of the day before. She waved her parasol at me, and I was going to shout back an ante-mortem statement but my attention was diverted by seeing that the anchor-ropes, which were held by a dozen men a moment before, were now dangling.

We were off! No, we were not moving at all; the earth was slowly slipping away from us and turning at the same time. The north of Paris was sloughing around to the north-east.

The Eiffel Tower pushed down and away. It slid down until we were at the first landing, the second, we were even with the top; it glided down beneath us a hundred feet. I leaned over the basket and spat violently. The tall man jabbered in French, shook my hand, and the Professor all the while tumbled out cards, dodgers and sundry advertisements in the interest of science. And still the little man lay in the bottom of the basket, and the great city slowly swirled and slipped away, away, away.

The houses were only painted play-blocks gently rocking up and down, and the horses were surely out of a Noah's Ark collection. We were over the Champs Elysees, approaching the Arc de Triomphe.

The people appeared as black ants might when viewed from a tree-top. Some were moving, some evidently had discovered us and were standing still. There they were, three millions of them below us, eating, sleep

ing, fighting, praying; in houses, on roofs, on ladders, on fences, a few up the Eiffel Tower, but all on earth. Some were in love, some disappointed, some laying plans to get the money of others; black ants working for the applause of black ants; black ants seeking to reform ants blacker than themselves. All born in sin, and therefore deserving damnation. Yet some were to be saved by special enactment. How pick out which were to be saved, and which not? They were all alike. So I damned them all, and then forgave them—electing them to Tuilleries in the skies.

Paris with its long line of white houses was drifting away. The black ants could no longer be distinguished. The boulevards were reduced to mere threads, and the winding Seine was only a long crooked chalk mark.

M. Le Galligar had thrown out all of his advertising matter, and was slashing bags of sand and emptying them. The air was cold, and he was slapping his hands; I slapped mine, too. The face of the tall man was pinched and blue. The earth had given us the slip now; it had faded from sight, and below was only a great, white spreading cloud. And yet, strange! I could plainly hear human voices. They came as sounds do across a quiet lake.

The Professor consulted his instruments and made notes, then he pulled at a chord. The cloud enveloped us, covering our faces with mist.

The bleating of sheep could be heard—the voices became plainer—the green of the earth came back, but Paris was only a grey bank of clouds on the horizon.

The earth was rising to greet us. Men, women and children were leaving their houses —some running across the fields in our direction.

Two drag ropes were out, one with an anchor. Again the aeronaut pulled at the cord; the earth came nearer.

The basket dashed against a tree and bumped its freight all together. We apologised. Then we hit a stone wall, but shot up again ten feet in the air.

The anchor failed to catch, but fate was kind; an old woman in a rainy-day skirt and wooden shoes was after us. She ran like a printer. At last she got the rope in her hands; she yelled "whoa" sturdily, and pulled hard, but could not stop us. Other women came; children, too, then a man. All lent a hand. The fat passenger was standing, and the instant the basket touched the ground he rolled over the side into the friendly lap of earth. We all climbed out.

The Professor lighted a cigarette, gave a jerk to a small rope, and the great balloon struggled, quivered, sank and died.

A whole peasant village was babbling about us. The Professor was arguing hotly with the fat man; the peasantry, too, were taking part. It was all in very rapid Francais.

Suddenly M. Le Galligar received the gift of tongues. He turned and spoke to me in English, that was strongly tinctured with a Dublin brogue. He explained that the law of ballooning was that the first individual to seize the rope of a descending balloon was to have ten francs; this is to be paid by the person who first got out of the basket. He appealed to me as judge; should the fat man pay or not?

I decided he should pay, and he did.

Then we settled for the apples we had plucked from the trees by our dragging our anchor, and paid five francs for repairing the one wall.

As the Professor started to roll up the dead balloon I looked at my watch. It was just twenty-five minutes after two. We were twelve miles from the Eiffel Tower.

CELTIC ARCHITECTURE.

By Bryan J. Clinche.

Madame de Stael once compared architecture to frozen music. It might, perhaps, be equally well described as petrified history. The growth or decay of a people, and the stages of its material and mental progress, can be read in its buildings as well as in its literature, and often more clearly and fully. The gigantic works of the old Romans tell of their imperial power and wide dominion as forcibly as the pages of Livy or Tacitus. The intellectual supremacy of Athens in the ancient world is proclaimed as loudly by the perfected beauty of the Parthenon as by the story of Thucydides. The Gothic cathedrals bring before us the religious fervour and the cultivated thought of the middle ages as we should never conceive them from a perusal of the dry contemporary chronicles, and the materialism of the eighteenth century finds expression alike in the secular character and inartistic style of its buildings. Nor are the historical lessons to be drawn from architecture confined to wide generalities. The sharp distinctions of style between the neighbouring cities of Italy tell us of the exclusive spirit of the mediæval republics in that land, even as to the uniformity of style, though modern France shows the centralisation which is so striking a characteristic of its government, be it monarchy, empire, or republic. The fortress-palaces of Florence indicate the turbulence of its restless democracy, as well as their wealth and artistic feelings; and the light and graceful buildings of Venice, with the numerous foreign elements engrafted on their designs, tell of the domestic order and wide commerce of the queen of the Adriatic.

But if history can thus be read in buildings as well as in books, the same principles of investigation must guide us in the one study as in the other. Literary history, if it be worthy of the name, does not confine itself to recording decisive battles and describing the characters of mighty leaders. It seeks to bring before us the whole of human society as it existed in days now gone by, and not merely a few prominent characters or events. It finds often more valuable information in long-neglected sources, in memoirs, in letters, and old charters, than in official annals or the pages of courtly historians. To the modern writer the journal of a Pepys is more interesting than the elaborate history of a Clarendon. He would sooner trace out the growth of commerce, of learning, of popular liberties in a nation than tell the succession of its brilliant nobles and statesmen. The latter is an easier and more attractive task, but the former is a far more useful one. In like manner, if we seek to read history in architecture we must not confine our attention to the great masterpieces or the finished styles of art exclusively. We shall often find in humble buildings and rude monuments a key to the principles of art which guided the construction of the greatest, as well as a record of the steps by which progress was made, such as we might seek in vain in the latter. Considered artistically, the rude buildings of early times may be regarded in the same way as we look on the early sketches of a great painter or the first essays of a distinguished writer. In architecture the work of each age is but a step in the progress of the race. And its historic value must be judged not merely by its intrinsic merits, but also by comparison with what went before and what followed it. In this way alone can we properly read history in architecture, and when it is thus read it instructs at once in the progress of society and the principles of art.

In architecture, as in literature, however, though it is easy to trace progress through certain periods, the first stages are generally lost in obscurity. The architecture of most European nations can be traced back to a Roman origin, deeply modified, indeed, by local character, but essentially Roman both in constructive and decorative elements. In France, Spain, and along both banks of the Rhine, as well as in Italy, Roman architecture once prevailed, like Roman language and law, and, though debased during the decline of the empire and the invasions of the barbarians, it still furnished the models for the buildings which later generations erected. The modified Roman style was transplanted into the German territories by Charlemagne and his successors, and thus in none of these countries can we trace the growth of architecture from the simple buildings of the native tribes, such as they are described by Cæsar and Tacitus. Even in Italy itself the forms derived from Greece so modified the old native art that it is with the utmost difficulty we can trace a few of its elements. The old buildings have been mostly swept away, and the saying of Augustus that he had found Rome of bricks and left it of marble is a good illustration of the fate of early Italian architecture.

There is, however, one country in western Europe on whose soil we can trace the growth of architecture from the rude stone hut and cairn of the earlist stages of civilisation up to the perfection of the groined and richly-decorated church or cathedral. Through the whole duration of the Roman Empire Ireland remained untouched alike by the imperial arms or the imperial civilisation; only the introduction of Christianity brought Rome, and that at first but sightly, into contact with Ireland. St. Patrick and the early missioners who planted Christianity in the remote western island, though obedient to the Holy See, and in uninterrupted communion with it, made, apparently, no attempt to introduce a foreign civilisation or foreign customs among their converts. They obtained a modification of the native laws in such points as they conflicted with Christianity, but otherwise they did not change either the political or the social organisation of the country. Their stone churches were built on the type of the Celtic 'clochans,' or beehive-shaped houses, and their monasteries were formed on the model of the Celtic 'dun,' or walled hamlet, and not on that of the Roman villa, as on the Continent of Europe. Thus the Irish Celts after the establishment of Christianity, as well as their Pagan forefathers, were left to work out their mental and material civilisation from their own resources. Whatever they achieved in letters, laws, or art bore an essentially native character, and in nothing is this more clearly expressed than in their architecture.

The purely Celtic architecture of Ireland extends in point of time from about the date of Julius Cæsar, or perhaps earlier, to the close of the twelfth century. After that time the buildings that continued to be erected were modified to a great extent by Norman influences, though in the unsubdued districts the native art continued to live on, though with declining glories, at least three centuries later. The number of buildings older than

the Norman invasion is, however, extremely great. Of round towers alone considerable more than a hundred are still standing, most of them nearly perfect. The more or less ruined churches and oratories of every kind, from the rude cell of uncemented stone to the vaulted cathedral with its richly-carved arches and arcaded walls, are scarcely if at all less numerous than the round towers. Stone forts of cyclopean masonry, whose origin is lost in the darkness of prehistoric times, and early monasteries built on the type of these pre-Christian abodes, are to be found in abundance along the western coasts, and even the pyramid-tombs of Egypt are represented in the sepulchral mounds of Meath, and of perhaps other districts. From the rudest of these erections to the most finished the series is uninterrupted. The stone fort is succeeded by the monastic enclosure where the monks dwelt in rudely-built cells, and a larger cell served as a church. The cell of dry stone is succeeded by the square church with its straight walls laid in mortar; and this in turn is followed by the church containing a nave and chancel, and later on provided with a lofty belfry. In succession we trace the progress from rude rubble-work to coursed masonry, and from that to the use of cut and moulded stone-work, and from the curved roof formed by overhanging courses of stone to the perfect construction of the true arch. Each step in progress finds its expression in different buildings, each indicating a stage in the development of native art, and the whole forming a series such as no other country of Europe can parallel.

Among the prehistoric monuments of Ireland, the sepulchral monuments of New Grange, in Meath, claim a foremost place, though more for their mass and their analogy with the pyramid-tombs of Egypt than for their constructive features. On first sight they resemble natural hillocks, and it is only on close examination that they are found to consist of stones heaped up by human labour, and now covered with a thick carpet of grassy sod. These hillocks are scattered in considerable numbers along the banks of the Boyne, not very far from its mouth, in a district which is believed to have been one of the royal burying-grounds in Pagan times. Indeed, although there is no record of the origin of those monuments, the Irish annals mention specially that the monarchs of Ireland were buried in this place until shortly before the fifth century. Three mounds are prominent for bulk among the many smaller ones, and are known as the hills of Dowth, Knowth, and New Grange. The latter is the largest, and has been opened to inspection for nearly two centuries. It covers nearly two acres, and is eighty feet high at present, with a rounded outline such as a heap of loose stones would naturally take when piled together. But New Grange and its companion hillocks are more than mere cairns. Their interior is honey-combed with chambers and passages carefully built of huge blocks. The central chamber of New Grange is round and about twenty feet in diameter, with a square recess about eight feet square projecting from each of three sides, and a passage leading from the fourth side to the outside of the mound, the whole of the chambers thus forming the figure of a Celtic cross in plan. Whether this resemblance be accidental, or whether it had anything to do in suggesting the peculiarly Irish form of the ornamented cross in Christian times, it is impossible to say. The passage-walls are formed by huge blocks of stone, and the roof is covered with immense flags, one being seventeen feet long and six wide. The central chamber is domed rudely by courses of stone projecting inward, each course overlapping the one beneath until they nearly meet, when the opening is covered by one large block. The height to the centre of the roof is over eighteen feet, while the height of the passage is only about six, and the side-chambers somewhat more. As in the Egyptian pyramids, so in New Grange, the piling up of a mass of material seems to have been the only element of architecture aimed at by the builders. The amount of stone, mostly loose field-stones, piled up amounts by measurement to nearly two hundred thousand tons, or a greater quantity than has been employed in the construction of any European cathedral except St. Peter's. No mere savage tribes could have accumulated such masses, which, like the Pyramids, imply the existence of a numerous population and a strong and organised government in the country where they were raised. Rude in design as they are, they must, on account of their mass at least, be ranked among architectural works, and they derive an additional interest from being among the oldest monuments of western Europe as well as of Celtic buildings.

A step in constructive skill beyond the New Grange mounds is found in the stone forts of the western coasts, whose origin is also attributed to the Pagan times. Several of these forts are found in the small islands of Arran, off the coast of Galway, but the most perfect existing sample is the Staigue Fort, as it is called, in Kerry. In this, although mortar was not yet used, the stone blocks were evidently quarried instead of being gathered from the grounds, like most of those used at New Grange. They are also carefully laid in bond, running lengthwise into the walls from both sides, and packed so tightly with smaller pieces that the work is yet almost perfect. Indeed, one is struck with astonishment at the perfection of masonry that has been attained without the use of mortar. The walls, which are nearly eighteen feet high, are carried up with a peculiar curved batter both inside and outside, and access is given to the top by flights of stone steps on the inside. The gateway is formed with huge square blocks and is covered with similar stones, and in places small rooms are formed in the thickness of the walls. From the analogy of other similar enclosures it may be presumed that stone huts were built for shelter within the walls of the fort, which is an unroofed circular enclosure about ninety feet in diameter. A ditch 24 feet wide and six feet deep, now partially choked up, surrounded the walls. Remembering that the tumuli at New Grange were both a work of greater labour and evidently connected with the residence of the monarchs of Ireland, we can only account for the superior construction of the Staigue Fort by admitting that considerable progress had been made in building skill among the Irish Celts between the date of the first and that of the second. Indeed, we find some masonry of the early Christian period so like that of the Fort that we are fairly justified in attributing its erection to a time not very distant from the arrival of St. Patrick, in the fifth century.

The monastic enclosure of Innismurray, on the island of the same name off Sligo, has many points of resemblance to the pagan forts, on the type of which it was evidently built. Like theirs, its walls are built of dry stone and are provided with gateways, but there are no stairs for giving access to the top, nor any of the other defensive features so well marked in Staigue Fort. It also differs from the latter in the existence of several buildings within it which show the nature of the monastic cells and churches in the early days of Christianity in Ireland. Nothing, indeed, could be more simple. The cells were built of stone piled together in overhanging courses and in the form of a beehive. The doors were very small, three or four feet high and from two to three wide, and the windows were small apertures rudely formed in the walls. The churches in the Innismurray enclosure are somewhat better built and show traces of mortar of a primitive kind, being evidently another step in advance. The mortar in one is a mixture of clay and lime, which seems to have been simply poured on the dry stone-work like modern grouting. In another the mortar is lime and sand, applied in the same way. The windows of the churches also show that the art of cutting stone was known, as the lintels are cut into the form of an arch. A passage in one of the Irish histories attributes the construction of the first stone-and-mortar building to a time shortly after the coming of St. Patrick, and in actually existing ruins we find a primitive mortar used in buildings side by side with dry-stone masonry resembling that of the pagan forts.

Indeed, though the churches in Innismurray were built with mortar, such as it was, other Christian churches were built in a fashion closely resembling the beehive-shaped cells we have just mentioned. A nearly perfect specimen of a church of this kind, dating back to probably the sixth century, exists still in Kerry and is known as Gallarus Oratory. Anything more unlike a modern church, or indeed a modern building of any kind, it would be hard to conceive. Yet we shall find its type gradually developed through successive Irish buildings until it was perfected in the scientific structure of Cormac's Chapel or St. Doulach's. The disposition to improve old forms rather than to borrow new ones is strongly marked through all the Celtic buildings and forms one of their most marked peculiarities. This Gallarus church resembles in shape a large boat with square ends, turned bottom upwards. Internally it is fifteen feet long and eleven wide, and the courses of stone in the side-walls project inward as they rise until they meet at the top. The section of the side-walls, both outside and inside, thus has the form of a Gothic pointed arch, though the beds of the stones are horizontal and the principle of arch construction is nowhere introduced. The door of the oratory, as of most of the early Irish buildings, is small and low, not over four feet in height, and the opening opposite which served as a window is still smaller. The whole appearance of the structure is extremely singular and vividly suggests the primitive stage both of art and science among its builders. The chief interest attaching to it, indeed, is that it represents the first type of an Irish Christian church, from which the noble buildings of later ages were gradually developed in the course of time. The second stage of progress is shown at Innismurray, where, side by side with cells of dry-stone masonry, we find three small churches built up with straight walls on which rests a roof formed on the same principle as that of Gallarus. Even between those little buildings themselves a difference can be noted. All three are laid in mortar, but in one the mixture used is clay mixed with slacked lime, while in the others true mortar is used, made apparently from broken shells.

The buildings just described are only a few specimens of the many early Celtic remains scattered over the west of Ireland. The little islands along the coast seem to have been favourite sites for the primitive monastic communities, and their remoteness and the respect of the people for their origin have both aided in their preservation. In some instances, as on the remarkable rock known as Skellig Michel, which rises several hundred feet above the Atlantic at a distance of twelve miles from the western shores of Kerry, the long-deserted monastery still serves as a place of pilgrimage to the surrounding country. The popular religious practices thus bind the long-past age and its rude buildings with the present time. It is worth notice that few remains of secular buildings of the same age are to be found. They, no doubt, were constantly changed to meet the wants of each successive age while building was still a rude art, and,

moreover, they seem to have been usually built of more perishable materials than the churches and cells. The remains of the palace of Tara are only indicated by foundations of earth, on which, no doubt, a wooden superstructure was once raised. Even for fortifications earthen walls seem to have been preferred by the Celts after the time of St. Patrick, and the stone forts of the west are not represented in later times. The burial-mounds, too, seem to have been abandoned after the introduction of Christianity. The Christian cemeteries of the eighth and ninth centuries which still exst, and, indeed, sometimes are used even now for their original purposes, have no resemblance to the prehistoric sepulchres. Sculptured gravestones and crosses are the burial monuments of Christian Ireland; and though many of them are in the highest degree remarkable as works of the stone-cutter and sculptor, they need not be further alluded to in our remarks on Celtic buildings properly so called.

The strange building near Kells, in Meath, known as Columbkill's House, stands midway between the primitive oratories like those we have just described and the buildings of the eleventh century. In appearance it resembles a house more than a church, and its doors and windows are put in without any attempt at symmetrical arrangement. The fact of its being divided into three stories, and still more the construction of its roof, show an advance on any of the early buildings, while its want of ornament or anything like architectural arrangement of parts shows that its builders were far behind their brethren of the tenth century. Its date is uncertain, but as a colony of monks from Columbkill's monastery in Iona took up their abode at Kells in the early part of the ninth century, it is most likely that it was built about that time. Though small, being only twenty-seven feet in length by twenty-four in breadth, it was evidently a monastery complete in itself, unlike the arrangement of the earlier communities, where the monks lived in seperate cells surrounded by a wall of enclosure. The lower story of the Kells monastery was used as a church, the middle as a refectory, and the loft above as sleeping rooms. The construction of this roof is the most noteworthy point about the building. The second story is arched with a barrel-vault of stone, and above that a high, pitched stone roof is carried up with straight sides externally, but with the form of a pointed arch on the inside. The lower part of this roof is built with level courses of stone, like the Gallarus Oratory, except that they are laid in mortar; but above the top of the round arch the stones are disposed in a rude pointed arch with the help of very thick mortar-beds. The appearance of true arched construction is in itself a great advance, but it is even more interesting to trace the origin of the pointed arch above, and to observe the tentative way in which the early builders began the substitution of arching for the overhanging courses with level joints used in the early oratories. In subsequent buildings the upper pointed arch was as truly formed as the lower, and thus a form of roof peculiar to ancient Ireland was produced, the construction of which both inside and outside was stone.

In the buildings hitherto described we had to rely on conjecture and internal evidence for the date of their erection; but in Tomgraney church, in the county Clare, we have a nearly perfect building, whose date is fixed by contemporary records. The Irish annals inform us that this church and its round tower were built in 964. No traces of the tower remain, but the church yet stands comparatively perfect, and shows a remarkable advance, in architectural design, on the House of Columbkill and the earlier buildings. In size it is much larger, being eighty feet long and twenty-seven wide. Its masonry is excellent, and equal to good modern work, and the introduction of buttresses on the angles of the front gives it an appearance of strength and finish that is wanting in the older buildings. But it is in the finish of the window-jambs that the greatest advance is perceptible. They are not only dressed, as in some of the older buildings, but the stone is elaborately carved into ornamental patterns. The design is the chevron, or zigzag, such as the Norman architects introduced into England in the following century, but which is here wrought out with a delicacy and finish far surpassing the Norman work. The bold mouldings of the chevron are filled with interlaced tracery of the finest character, which seems rather copied from the Celtic goldsmiths' work than from any foreign source, and which is yet applied with the utmost taste to its new purpose. The doorway, on which in later buildings the most elaborate finish was lavished, is in this example a plain, square-headed opening. It looks as if in the use of carving, as in other points, it was only by successive steps that novelties were introduced into Celtic architecture. In this is perhaps the stronget proof of its originality as well as of its progressive character, which was kept up through the confusion of the Danish invasions, and only died away after the establishment of the foreign government of the Anglo-Normans in Dublin.

The record of the building of a round tower in connection with this church brings us to consider these peculiarly Irish buildings. The origin of the round towers has been for a long period the most disputed question in Irish architecture. They have been attributed to the Phœnicians, to the Fire-Worshippers, to the Danish vikings, and in fact to anybody and everybody except to the very people who were using and building them at the time of the Norman invasion. It is one of the curiosities of literature that this extraordinary controversy on the origin of the round towers should have ever arisen in the face of their close and all but invariable connection with Christian churches and the actual records of the erection of many of them. Brian Boroimhe is said expressly by the Irish annalists to have built thirty-two, and the very name in Irish —cloic-theugh, or bell-house—expresses accurately their use. It would be as reasonable to separate the belltowers of Gothic architecture from the buildings to which they are attached as to seek to separate the round towers from their churches. In several cases they are actually connected with and bonded into the masonry of the churches, and occasionally, as at Glendalough, they rise out of the roof itself. The character of their masonry and the structure of their doors and windows are precisely similar to those of the churches which they adjoin, and whatever variations they exhibit in this respect are no greater than those shown in the work of the churches themselves. That many of them are detached from the churches is a feature common to the architecture of other lands. Giotto's campanile at Florence may serve as one instance, and it is by no means an isolated one. In this structure the towers show all the variations of style that characterise the contemporary buildings. Some, like that at Clondalkin, near Dublin, are built of stones picked up from the neighbouring ground and roughly laid in coarse mortar. Others are built of coursed rubble, and in a third class the stones are not only selected with care, but fressed to the curve of the walls by the hammer. Finally, in the round tower of Ardmore, in the county Waterford, the masonry is of the finest square blocks, uniform in size, and dressed with the utmost skill. This tower is also relieved by projecting string courses and diminishes regularly by offsets at each. Its doorway is ornamented with the very well-marked patterns peculiar to the Irish twelfth-century work, and in every respect it tells its age as unmistakably as it is possible for a building to tell it.. It would be as reasonable to refer the Tour de St. Jacques in Paris, with its Gothic architecture, to prehistoric times as this tower of Ardmore, and, though the most highly finished, it is only one of a class. The details of the doorway in Timahoe, in the Queen's County, are equally definite in their ornamentation, though the masonry is inferior to that of Ardmore. The question of the origin of the Irish round towers cannot again be raised, and their date can be safely assigned to the last four centuries of Irish independence.

The division into nave and chancel—the latter somewhat narrower than the former, and separated from it by an arch—becomes a feature in many of the later Irish churches, and adds a good deal to their effect, even in small buildings. The chancel arch was often richly ornamented, and is always an important feature in the internal arrangements. The ruined church of Inniscaltra, built by Brian Boroimhe on an island in the Shannon, offers an early example of the division into nave and chancel all the more valuable because its date can be fixed by history at the beginning of the eleventh century. The arch between the two is recessed, and the jambs below the springing incline inwards—a form peculiar, we think, to Ireland, and apparently borrowed from the inclined sides of the older door-openings. The door itself is square-headed, but an arch is formed in the thickness of the wall outside it, and the springings ornamented with carved heads, a curious counterpart of the capitals used in Gothic doorways in other countries. Nothing is more noteworthy in these ancient Irish buildings than their gradual approximation by spontaneous progress to the forms of the Romanesque buildings which on the Continent of Europe had been developed in the course of centuries from the old Roman architecture. In the Romanesque, doorways, jabs, columns with semi-classical capitals and bases, generally support the archways. In the Irish buildings the inclination inward of the jambs shows that the idea of the Roman column was unthought of, but that the native taste, nevertheless, introduced ornament at the springing of the arch as the most important point. The Inniscaltra church is small, the chancel being fifteen feet long and the nave thirty-one by a width of twenty. Still, its dimensions are much larger than those of the primitive oratories, and it must be remembered that the Irish Celts seldom aspired to erect churches on the cathedral scale. Their genius was shown rather in the perfection than in the size of their buildings, and we should no more undervalue their works on that account than we should despise the architect of the Parthenon because his building is petty compared to the Roman Colosseum.

The introduction of the Cistercian Order into Ireland early in the twelfth century led to the erection of abbeys on a larger scale and with more complicated buildings than had before existed. As we have seen, the primitive Irish monasteries were villages of small cells surrounded by an enclosing wall. It is not before the twelfth century that we find traces of large communities living under a single roof, though such may have existed and been obliterated by time. The beautiful monastery of Mellifont, founded in 1142, was the earliest Cistercian establishment in Ireland; and the abbeys of Cong, where the last king of Ireland ended his troubled career, and of Holy Cross near Thurles, belong to the same century. All three have suffered a good deal from time and abuse, but the walls still remain in good condition and show that the Irish builders found no difficulty in meeting the requirements of the new class of buildings. The same century was also marked by the erection of the first churches that for size deserved to be ranked as cathedrals. As might be expected from the history of other countries, these Irish cathedrals have been in great part replaced by later buildings, but some of them still retain portions of genuine Celtic work and indicate the size of the originals. Cashel Cathedral was built in the middle of the twelfth century, was afterwards rebuilt in the Gothic style of a later day. Its dimensions, which are two hundred and ten feet in length by one hundred and seventy across the tran-

zepts, show that very considerable churches were coming into use in Ireland as in other countries. The portions of the Cathedral of St. Jarlath at Tuam, which have been incorporated into the new church also indicate a building of considerable size. The chancel arch is formed in six recesses, each having a distinctive ornamentation of a most elaborate kind, and the innermost being twenty feet in diameter. Killaloe Cathedral contains a noble monument of Celtic art in the arched tomb of Murtagh O'Brien, the third from the last monarch of Ireland. It is formed in the thickness of the wall, with several arches receding one behind the other, and all carved in black marble with a delicacy of touch and a variety of design that it would be hard to parallel anywhere, and which prove conclusively that Celtic art was in full progress down to the closing days of the Celtic monarchy in Ireland.

It is, however, in the smaller buildings which have escaped the alterations of following ages that we can best make out the character of the native Celtic architecture. Several churches of the period we allude to now still remain nearly perfect, and some are actually used at present. St. Doulach's Chapel near Dublin, a church at Clonfert, the cathedral at Killaloe in Clare, and Cormac's Chapel on the Rock of Cashel, are among these still complete buildings. The last is perhaps the most finished specimen of native Celtic architecture, and as it remains almost wholly unaltered since its erection it is worthy of description. Its dimensions are small, as its whole length is only fifty-three feet, but the artistic disposition of its parts, and the richness and taste with which it is decorated, more than compensate for its size. Like most of the later Celtic churches, it is divided into a nave and chancel, with an arched recess behind the chancel for the altar. The arch separating the nave and chancel is recessed into six faces, all richly ornamented, and the walls inside are arcaded in both divisions. The nave roof is a barrel-vault divided by moulded ribs, while the chancel is not only ribbed but also groined. An arcade runs around the walls of the altar niche, and the wall over it is ornamented with carved heads. The windows are high up and throw a solemn light over the whole in perfect keeping with its sacred character. The doorways to the nave are on the sides, and are recessed on the outside, with receding arches highly ornamented. At the end of the nave next the chancel a square tower rises on each side, making the whole building cruciform in plan. The doors from these towers to the nave are beautifully finished in keeping with the rest of the architecture. On the outside the walls are arcaded with two stories of arches. The roof is entirely built of stone. A circular vault is turned over the nave and chancel, and above each pointed vault carries up the masonry to near the ridge of the roof, which is formed on it with blocks of stone carefully adjusted so as to throw off the rain. Between the two vaults are lofty chambers, which were apparently heated originally by flues running under the floor in a fashion unknow in any building of the time. Indeed as a whole this small chapel is unequalled either in construction or finish by anything of its time. Considering that it is essentially a work of native artists, it goes far to justify the opinion of an eminent English writer on architecture, Fergusson, when, in speaking of the Celts, he says—"Had their art not been nipped in the bud by circumstances over which they had no control, we might have seen something that would have shamed even Greece and wholly eclipsed the arts of Rome."

The period of pure Celtic architecture closes with the twelfth century. In later buildings the influence of the Norman builders modified its forms into a close resemblance with those adopted in France and England, and at the same time gradually extinguished the artistic feelings which were so marked in the earlier works.

NOTES AND QUERIES.

TWO CO. LIMERICK NAMES.

Killarney, 29th Dec., 1902.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Dear Sir.—Having been reading some time ago in a work called "The County of Limerick," by the Rev Jas. Dowd, about the "Ui Fidgenti" and the "Ui Connaill gabhra," I would be glad of information concerning their surnames, or who are supposed to be their descendants; also where would I get any further information about them.—Yours faithfully,

"COGANAIT."

A BALLAD OF BALTIMORE.

Besides Thomas Davis's famous poem on the "Sack of Baltimore" by Algerine pirates, there is an older local ballad on the subject, which, according to Bennett's Bandon (1869), whence it is now copied, was up to that time still sung in Baltimore and the neighbourhood. A list of the persons who were captured and taken off to Algiers on that doleful occasion is published in Dr. Caulfield's "Council Book of Kinsale"; but the names, with scarcely an exception, are all English ones, as Baltimore at that date was like Bandon, an exclusively English colony. From this quaint old Baltimore ballad it would, however, appear that a daughter of O'Driscoll, the Irish chieftain, to whom Baltimore and the territory around originally belonged, was also carried away by these daring and dreaded corsairs, though possibly prior to the above occurrence.

"Oh! Baltimore, though thou wert once the boast
Of the great O'Driscoll and his host;
With thy classic scenes and feudal fame,
It scarcely now deserves thy name.
In thy harbour ships may safely ride—
Safe from the storm, the wind, the tide:
Thy ancient castle stands proudly high;
It speaks aloud of the days gone by.

Within thy walls ruled a chieftain bold.
Whose word was law, as oft was told;
Where were festive scenes of sport and play,
For valorous chiefs and ladies gay.
Being free from doubt and from wordly care.
They little thought of the danger near,
As the hours did glide merrily on,
And all enjoyed the dance and song.

O'Driscoll gazed round on sea and land,
And called to his vassals on the strand.
Readily his commands they did obey,
And launched his galleys into the sea.
He little thought on that false day,
That the Algerines would come that way.
They came on shore and caused great slaughter,
And carried off O'Driscoll's daughter.

Behold her anguish! also her fears!
A poor captive, carried unto Algiers,
Whilst in the harem she stood alone,
And the sun about her brightly shone;
To her flattering tales the Pasha told;
And showed her his pearls and his gold,
But this virtuous maiden, nobly born,
His love and his treasures she did scorn.

By force she was by him caressed,
But she plunged a dagger into his breast:
He loudly screamed and on Allah cried,
Then fell upon the ground and died.
The sentence was passed that she should die.
She thought of her home and heaved a sigh.
Resigned to her fate with pious love,
Her stainless spirit found a home above.

Thy pride is gone, and thy glory is o'er,
Ruined and neglected Baltimore."

EVOC.

THE O'CONNORS DON.

The following interesting note on this old Irish family is taken from the late Sir Bernard Burke's "Reminiscences—The Rise of Great Families":—Don, he explains, is another form of Dun, the Irish for dark. "Major Owen O'Connor, of Belanagare, Governor of Athlone for James II., was taken prisoner by William III., and confined in Chester Castle, where he died in 1692; and his nephew and eventual heir, Denis O'Conor, of Belanagare, was involved in the troubles and misfortunes which seemed at that time the common inheritance of all who professed the Catholic religion. Suits were instituted for the sequestration of his paternal estates, and he was happy to preserve a portion by the sacrifice of the rest. Though thus left but a small fragment of the once broad domains of his forefathers—domains which were guaranteed by several solemn and indisputable treaties—he was still the supporter of all whose virtues or distresses had a claim upon his bounty. The traditions of the county attest his benevolence and hospitality, and the effusions of the bards record the virtues of his character. At Belanagare it was that Carolan composed the most impassioned of his melodies, and felt the true poetic inspiration. "I think," said the bard on one occasion, "that when I am among the O'Conors the harp has its old sound in it." Denis O'Conor's son and successor, Charles O'Conor, of Belanagare, a learned antiquary, early devoted his attention to elucidating the history of his country, and unfolding the long-neglected records of her people, and collected with indefatigable research and labour the most valuable information regarding the annals and antiquities of Ireland. He also took a prominent place amongst those who first struggled for Catholic Emancipation. Of his grandsons, the eldest, Owen O'Conor, succeeded to the title of Don as head of the family at the decease of his kinsman, Alexander O'Conor Don, of Clonalis, in 1820; and the second, Charles O'Conor, D.D., Chaplain at Stowe, was the erudite author of "Rerum Hibernicarum Scriptores, Columbanus's Letters, etc."

LECTOR.

DATE OF MARRIAGE WANTED—HESELTINE TO HALAHAN

TO THE EDITOR DUBLIN PENNY JOURNAL.

Can any of your readers furnish me with the date of the marriage of Thomas Heseltine, Master Mariner of Hull, to Eliza Halahan, of Black Rock, near Cork. Supposed to have married in Ireland about 1796.

E. J. H.

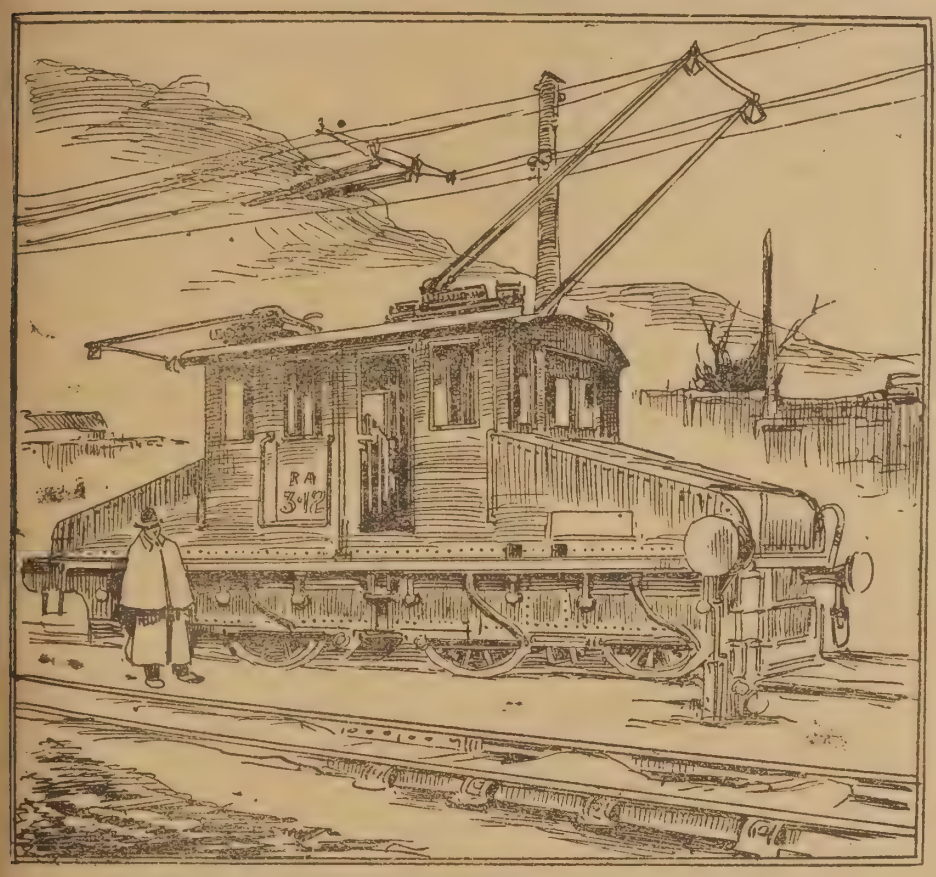
22 Park street, Hull.

A MAKER OF REFERENCE BOOKS.

The reference book is a "modern convenience" of doubted value. Its gleanings from this and that field of knowledge are stored in the too-handy "handy-volume." The hasty worker wants a fact, finds it readily in the ready reference book, uses it at once, and as promptly forgets all about it. The best of all reference books is a well-stored memory.

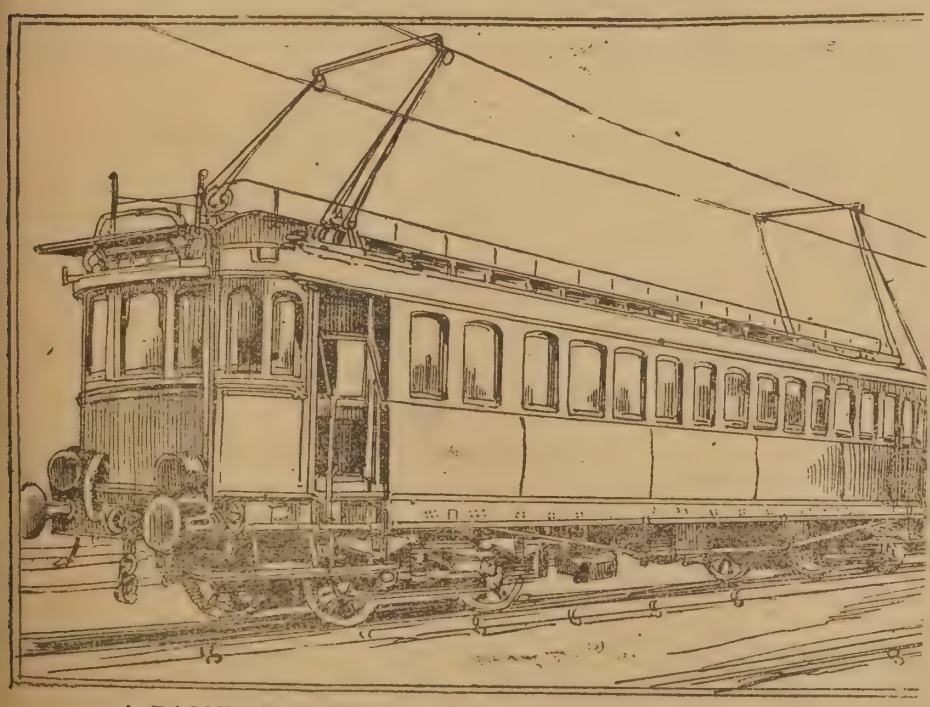
One of the most renowned compilers of referential odds-and-ends was Dr. Cobham Brewer, editor of the "Dictionary of Phrase and Fable." Although his books serve to lighten the labours of, well, easy-going students, Dr. Brewer himself was all his life an indefatigable worker. Besides the well-known "Phrase and Fable," he published a "Readers' Handbook," a "Historic Note Book," a "Dictionary of Miracles," a "Guide to Science and Rules for English Spelling." His more solid works include a "History of France" and a "History of Germany."

We do not commend his works unreservedly, but his method of working was admirably simple and effective. "I always read with paper and pencil at my side to jot down whatever I think may be useful to me," he explained to an interviewer shortly before his death a few years ago. "These jottings I keep sorted in different lockers. This has been a life-long habit with me, and the compiling of them into a volume consists chiefly in the selecting, sorting, explaining, correcting, and bringing down to date. My literary references, for example, are all contained in these pigeon-holes behind me, each letter having its own bundle of slips, and the slips in their turn all running in alphabetical order. This system of commonplacing I have kept up regularly for nearly seventy years, and the fruits of it are embodied in my various books. In fact, the "Phrase and Fable Dictionary" and the other books of that class may be said to be merely different sections of one gigantic commonplace book."



Dr. Brewer was an easy, steady worker, steering the wholesome middle way between indolence and overwork, taking proper rest and recreation, accomplishing wonders by his habits of industry, order, and perseverance. He worked all his life; his every day held its duty and its relaxation, and his excellent habits helped him to live to the grand old age of 87 years.

ELECTRIC TRACTION.



THE NEWEST DEVELOPEMENTS.

STEAM LOCOMOTIVES TO BE DISCARDED.

A PIONEER ELECTRIC RAILWAY.

FREIGHT LOCOMOTIVE OF THE VALTELLINA LINE.

A PASSENGER CAR OF THE VALTELLINA ROAD.

The electric railway built by Ganz and Co., of Budapest, along the shores of Lake Como, was opened for regular traffic on September 4 last, since which time it has been running faultlessly. It is called the Valtellina line, and is 66 miles long, and of standard gauge. It runs along Como and the River Adda, with three branches extending from Lecco to Colico, from Colico to Chiavenna, and from Colico to Sondrio.

The central power station is situated at Morbagno, the water power of the River Adda being utilised to drive the turbines. The effective head of the turbines is 30 meters (98.4 feet). There have been installed three turbine dynamos, each with a capacity of 2,000 horse power at 150 revolutions per minute. The three-phase alternating current generators coupled directly with the turbines generate current at a tension of 20,000 volts at the terminals. This high-tension current is led to the primary conductors of the line through a switchboard, and is transformed into three-phase alternating current at 3,000 volts by means of step-down transformers situated along the line. This stepped-down current is led to the contact wires, and thence directly to the motors of the vehicle. The primary conductors are extended along the line on the same poles which carry the contact wires.

For the line at Lake Como, the motor cars are 18.1 meters in the carriage body, and 19 meters (62¼ feet) over the buffers. The cars rest on two bogie-trucks, each having a wheel-base of 2½ meters. Without passengers, a car weighs 50 tons, including the motors. The wheels are 1.17 meters (3.8 feet) in diameter, while those of the electric freight locomotives supplied to the same line have a diameter of 1.4 meters (4.59 feet). The locomotive meter weighs 3.8 tons; its rotor about 1½ tons. The car motors with a smaller size wheel weigh 3½ tons approximately. Each series pair of these motors develops a full-load horse-power of 150, while the high-tension motor itself, when running at full speed with the low-tension motor cut out, yields about the same horse-power. Thus, 300 horse-power are developed in one truck carrying two pairs of motors, or 600 horse-power (450 kilowatts) on one train with front and rear driving cars.

The current generated at the central station has a frequency of 15 per second. When running synchronously, the high-tension motors make 300 revolutions per minute. In the rotor of the same motor, the periodicity currents vary according to the slip. During the start, when the high tension is switched into series connection with the low-tension motor, after

the speed has risen to "half-speed," or 150 revolutions per minute—above which speed series connection ceases—the periodicity of the currents in the rotor of the high-tension and in the stator of the low-tension is about 7½ per second. The speed of the locomotive motors is 125 revolutions per minute. The Valtellina locomotive motors are not geared in series; they are all high-tension.

The line will be used for the transportation of both passengers and freight. Passengers are carried by the cars at a speed of 60 kilometers (37½ miles) per hour. The electric locomotives are used for hauling freight trains. Each train has a net weight of 250 to 300 tons. The speed attained is about 30 kilometers (18½ miles) per hour.

The commercial merits of the system are many. The initial outlay was not inordinate. The cost of maintenance is said to be comparatively small. For railways of considerable length and heavy traffic, less maximum power is required in the central station with the Ganz high tension distribution than with the necessarily low tension of continuous current distribution, the ratio of maximum to average load at the central station being less.

The electrical merits of the system are no less noteworthy, especially when the length of transmission from one central station is considered. By reason of the high voltage, no large currents are used. The loss involved in converting to continuous current by rotary converters is eliminated. The use of pure induction motors without commutators, and the coupling of these in series pairs, results in a high motor efficiency.

LOVE OF THE SEA.

They only who have been cradled and nurtured within sound of the ceaseless song of the wild waters can fully realise their subtle charm, or tell the unutterable yearning for their music—the craving for their breadth, for their reflections of the great clouds, for their incessant movement—which oftentimes comes over the spirit, when the body is tied to some monotonous inland region; the unspeakable longing for sight and sound of the great green waves, the tossing spray, and screaming sea birds, and the wild breeze that rushes past laden with the salt seabrine. None else can understand the intensity of that passionate love which the sea and its shores can inspire—the thousand memories linked with those wide, white sands, those slippery rocks—that brown, wet tangle, each leaf of which seems to have some hidden power whereby to twine itself round the innermost depths of the soul. None else can sympathise with the bitter disappointment of awakening from some blissful vision of shell-gathering, or idling by those great waters to find that in truth it was but a dream—Miss

WIRELESS MESSAGES ON A RUNNING TRAIN.

On October 13th wireless telegraphic signals have been received on a special railroad train running at the rate of 60 miles an hour between Toronto and Montreal. The messages were sent from a station at St. Dominique, and the train remained in communication with the station over a distance of eight or ten miles. The electric waves were transmitted by means of two vibrators, ten by twelve feet, connected with an induction coil giving an eight-inch spark, and were received on the train by an ordinary coherer. The collecting wires were run through the signal cord guides inside the train, extending about one car-length on each side of the coherer. The signals were rendered audible by a relay ringing bells in three cars.

THE DEATH OF LEURY.

A LEGEND OF TYRONE.

Within the precincts of the episcopal demesne of Clogher stands an earthen mound or fortress, called Mullagh-rath, bearing considerable resemblance to the celebrated ones of Tara and Emania, both in the extent of its rude fortifications and commanding situation. Local tradition points to it as once the residence of an Irish monarch who, as history records, swayed the sceptre of Ireland when St. Patrick began his mission (see Moore's Ireland, vol. I.), and whose fate is recorded in the following legend, the memory of which is preserved imperishably in the names of some of the neighbouring townlands. The harbour of Dunleary (Dun-Laoghaire—Anglice, the fortress of Leary), near Dublin, is said to have had its name from the same monarch.

Sir James Ware informs us, upon the authority, it would seem, of the Senatensian Annals of Cathal Maguire, a monk of Armagh, that Clogher (Clodh-oir—Anglice, the Golden Stone) took its appellation from a stone covered with plates of gold, from which an idol of the Pagan Irish, called Kerman or Hermand, Kelstack, delivered oracular responses to his worshippers in the days of heathenism (see also O'Flaherty's Ogygia, vol. II.).

The Closach is the ancient name of the district in the centre of which stands the city of Clogher. Tulnafoil signifies "the ground of the torn flesh."

The grave of King Laoghaire is still shown in the ancient burying ground in the townland of Killuaheery, which derives its name from it. Its site, however, is now scarcely distinguishable from the surrounding fields. In a few years, perhaps, the plough will have passed over it, and all trace of it will then be utterly lost.

In Clogher once Kyng Leury raigned,
Cruelle hee was and sterne;
From Mullagh-rath oft went hee forth
To spoyle, to slay, to burne.

And noughte hys spyrritte fierce could tame
Save ye mystique voyce alone
From Kerman Kelstach's bloudie shryne,
Where stoode ye Golden Stone.

One morne hee hadde assembled alle
Hys galloglasses trewe,
To holde a greate and merrie huntynge
Ye wooddes of ye closach throughe.

They alle hadde gathered in ye bawne
To wage yb sylvanne warre,
When, lo! a hoarie aged manne
Stoode there their sporte to marre.

In sackclothe coarse hee was attyred,
Erin's great Sayncte was hee,
And from hys gyrdle ther honge doune
Both crosse and rosarie.

Thenne up hee spake to that haughtie king,
"Repente for the sinnes thou hast done;
Worshyppe ye trewe Almightie Godde,
And Chryste ye Virginne's sonne."

A wrathfulle manne was ye kyng that daie
Whenne hee herde what ye olde manne sayd,
Hys eyes they flashed like ye levin fyre,
Hys hand on hys swerde hee layd.

"But no," he cryed, "'twere shame that I
Should shedde ye caytiffe's bloude";
And he laughed, and sayd "We'll have a chase";
And thryce hee whystled loude.

Thenne round hym thronged hys fierce wolf-dogges,
Bran, Luath, Buscar, Ban;
And louder hee laughed, and cheered them on
That hoarie reverend manne.

But soon ye kyng hys aspect chaunged
Whenne ye Sayncte says scornfullie,
"That deth thou hast for mee prepared
Thou surelie now shalt die."

Thenne, wondrous, at ye Sayncte's commande
Ye dogges forgette ther lorde,
And baye at hym that nurtured them
And fedde them at hys boarde.

And fiercelie now they rushe on hym
And grapple at hys throate—
Tho' never hee hadde in battell quayled,
With feare hys herte is smote.

And onward paste ye gazing thronge
He franticlie did flie,
And pale and ghastlie was hys cheeke
And frenzied was hys eye.

On, on hee dashed, o'er hille and dale,
Ye baying dogges before;
And now Knockmanye's height is passed,
And now hee gaines Cormore.

But still ye sleuth-houndes on hys tracke
Come howlyng keene behinde,
And still whenne hee slacked hys frantique speede,
Their crye rose on ye winde.

On, on hee stretched—hys lyppes were parched,
And he breathed heavilie,
And on his haggard forehedde stoode
Bigge droppes of agonie.

Stooping, hys deer hyde brogues he loosed,
As hee strayned agaynste ye hille,
Esker-na-brogue they calle ye place,
In memorie of it stille.

Now, Leury, now thy strengthe exerte,
And every muscle plye,
O, couldest thou reache thy huntynge-lodge
Of distant Donogh-an-Igh!

Alas, thou ne'er shalt reache thy halle,—
In vaine ye feaste is spredde,
To-night ye Seanachie shall mourne
Hys chiefe and master dead.

Ye openynge packe gaine grounde apace
And now, o'erspent with toyle,
Ye ill-starred kyng they overtake
In bloude-stained Tul-na-foil.

But who shall telle hys frantique mien
And crie of agonie,
Whenne Luath foremoste gripped hys throate
And broughte him to hys knee.

Deepe in hys quiv'ryng flankes they fixe;
His lyfe-bloude now flows faste;
Ye fearfulle chase at length is o'er—
Hee shrieking breathes hys laste.

In Kill-na-heery now he sleeps,—
Hys is a lowlie grave—
May Heaven in mercie from such end
Eche erryng synner save!

NO OPEN POLAR SEA.

Both Peary and Baldwin, who recently returned with their expeditions from the Arctic regions, have remarked to interviewers that, in their opinion, there is no open polar sea. It seems certain that the north pole of the earth is situated in the midst of an ocean, which, although not eternally frozen, is practically always covered with ice. Neither of these explorers thinks it an impossibility that the pole should be reached. Peary believes it can be reached on sledges by any adequately equipped expedition starting from winter quarters in 83 degrees north latitude.

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

By CHARLES SMITH, M.D.

Æquum est enim meminisse & me, qui discerem hominem esse, et vos, qui Judicetis ut ñ probabilia dicentur nihil ultra requiratis. Cicero Univers

In Two Volumes.

VOL .

The Second Edition, with Additions.

BOOK II.

Containing the Topographical Description of this County, including the City of Cork.

Chapter I.—Continued.

The town of Macroomp, or, as it is pronounced, Macroom, is situated among hills in a dry, gravelly, red stone soil. The adjacent country is well improved with lime, brought six miles from the S. side of the river Lee. This place is said to take its name from an old, crooked oak (so called in Irish) which formerly grew here, under the boughs of which travellers used to pass. The castle of Macroomp is very ancient, being first built in King John's time, soon after the English conquest (according to Sir Richard Cox), by the Carews, but others attribute it to the Daltons. It was repaired and beautified by Tiege MacCarty, who died in it, anno 1565, and was father to the celebrated Sir Cormac Mac-Tiege, Lord Muskery, mentioned by Cambden and other writers as an active person in Queen Elizabeth's time. The late Earls of Clancarty altered this castle into a more modern structure, it being burned down in the wars of 1641 (20). It now consists of two square towers, about 60 feet high, with a large modern building between them. It is situated on the east side of the river Sullane; to the south are the gardens and a fine plantation of firs on a pleasant terrace over its banks. About 20 years ago, Dean Swift, in his progress through this country, was much pleased with the situation and state of this building. It is at present inhabited by Richard Hedges Eyre, Esq., who keeps it in good order. In this castle is an handsome, large gallery, with other good apartments; and Sir William Pen, the famous sea admiral, was born in it. At the foot of the castle is an handsome stone bridge over the Sullane. Opposite to the bridge is the parish church, dedicated to St. Coleman of Cloyne.

Upon the plantation of Munster, in the beginning of King James 1st's reign, the Lord Muskery brought over several English families—viz., the Hardings, Fields, Terrys, Goulds, Kents, &c.—and planted them in Macroomp. Here is a barrack for a foot company, and a market house. In this town a considerable number are employed in combing wool and spinning woollen yarn. There are here four salt pans constantly at work; they have the rock salt from England, by way of Cork, whence it is brought by land carriage. The salt is taken by carriers from this place into the country, where it is used in salting butter for exportation. In this town are some whiskey distillers, a liquor and manufacture so pernicious to the poor, that it renders every other employment useless to them.

The houses are built of a reddish, slaty rock, and there are good blue slates for covering in the neighbourhood. This place is situated on the frontier of a very wild country, being all rocky and barren to the west, and mountainous to the north.

Two miles west stands the high castle of Carrickafouky (i.e., Fairy Rock castle), built by the MacCartys of Drishane, in a wild and romantic situation. The entrance into it is by an high, craggy rock, of dangerous and slippery footing, where no more than one person at a time can climb, and he must be very active that will trust entirely to his feet. This rock is quite inaccessible on every other side, and hangs frightfully over the Sullane, which runs foaming at the foot of it through a craggy channel. To the east of the castle is a large stone, placed upon an high rock, secured by wedges of other stones; and near it the remains of a Druid altar, encompassed with a circle of stones (21) pitched endways.

The castle of Dundarerk (which signifies Mount prospect) is seated on a hill about a mile south of the former; and commands a vast extended view to the west, as far as the bounds of Kerry; to the east, almost to Cork; and a great tract to the south. It was built by the MacCartys. Dermot MacCarty forfeited this castle in the rebellion of 1641. It is an high, square building, having 70 stone steps to the battlements. Adjoining to it stood some modern buildings, now in ruin; here were large gardens and orchards, also destroyed. A little to the north is the ruined church of Kilnamartery. The country to the north and west, as far as the eye can see, is intermixed with large white rocks, and green spots; at first sight, a stranger at a distance might take them for the ruins of a vast city, the white crags resembling so many lofty towers, ruined churches and palaces. In a more level country the eye is, perhaps, pleased with little hills and gentle ascents; but in this rough situation, the imagination is astonished with a grandeur in nature which nothing but the scene itself can inspire a just idea of. If the forests which formerly covered these tracts are now no more, yet the naked rocks in some places, remains of woods in others, and parcels of cultivated grounds intermixed, afford a greater variety, and more delightful landscape. A little to the west of Macroomp is Codrum, the seat of Emanuel Hutchinson, Esq., who has improved a considerable tract hereabouts, by clearing the soil of stones and rocks, and manuring it with lime. On an old stone mearing, made by the Earl of Clancarty, there is this inscription on a large rock: D. E. O. C. 1686. F Fecit, i.e., Donough, Earl of Clancarty, fieri fecit. Which shows how imperfectly improvements were carried on in this country towards the end of the last century, when the raising of a great boundary of loose stones was thought worthy of an inscription. In Mr. Hutchinson's garden are the remains of a Danish intrenchment, being vaulted under ground. There are also several large ones near the old church of Clondrohid, some of which have triple intrenchments. On the top of an hill, called Lissecresig (three miles N.W. of Macroomp), being the same gentleman's estate, are the remains of a pagan altar (22), composed of three stones pitched close together, and a broad flag-stone lying near them.

Near this is a large circular intrenchment of stone, made in the same manner as those of earth; these raised of stone, the Irish call Caheras.

Cahirkegan, in the parish of Clondrohid, the house of Horace Townshend, Esq. The soil is cold, mountainous, rocky, and boggy throughout this parish, and not fitted for

(20) In September, 1602, it was taken by Sir Charles Wilmot, after a long siege, in the following manner. Cormac MacDermot Carty, the lord thereof, having escaped from the lord president, who, fearing he might cut off Sir Charles's retreat, and raise the siege, ordered him to quit the place, and return with his forces to Cork. This news vexed Sir Charles, being sorry to retreat without taking the castle. The night before his intended march, the besieged having killed a swine, and not having plenty of water to scald it, were forced to singe it with straw and fern. The fire took hold of a cabin in the bawn, within the castle walls, and the thatch flaming high, set fire to some tallow through a window in the castle, which soon raged so violently, that the Irish were forced to quit it, and make the bawn their last refuge, which being ready to be assaulted, they sallied out to the woods, in which attempt many of them were killed. The army, entering the castle, extinguished the fire, and leaving a garrison in it, marched back to Cork. Soon after, the Lord Muskerry, being hard pressed, submitted to the queen, and was taken into favour. Pacata Hib. p. 351.

(21) Saxo Grammaticus informs us that the places where the Danes fought their duels were sometimes surrounded with pitched stones, and sometimes in pits, as Ubbo who fought the Sclavonian. Sax. Grammat. Hist, Dan. lib. 3.

Olaus Wormius says their courts of judicature were plots of ground invironed with great stones, having one in the midst And the places also assigned for the election of their chiefs were such circles of stones. Monument. Dan. lib, 1. cap. 10.

22. These are the kind of rude altars, called, both in the Irish and old British language, Cromliagh and Crom-leche, which signify, in both, a crooked stone, not from any crookedness, but from their inclining posture. Mr Rowland, in his (p. 47) Mona Antiquatiqua conjectures, that the word is derived from the Hebrew, Cærum luach, i.e., a devoted table or altar. Noah, after he left the ark, was to build an altar, and offer up sacrifice on it to the Lord. Gen. viii. 20. And, 'tis to be supposed, he built it of such coarse and rude stones as the mountain (where the ark rested) afforded. In Exod. xx. 25, they had a precept not to build them of hewn stone, which seems to show that the British Crom-leche, and the Irish Cromliagh, are only the remaining effects of that ancient law and custom of not striking a tool upon the stones of their altars. These rude altars are sustained in some places by rows of pillars, as that above mentioned: and sometimes, on other stones of the same kind.

tillage without the greatest industry, not only in manuring the land, but also in clearing it of stone; otherways it is impossible to plough it. When the stones are removed, the sod is sufficiently deep, but this requires great labour. Upon the larger rocks they kindle turf fires, and keep them burning till the rock grows hot, after which it easily splits, and the readier if cold water be poured on before it cools. This labour is not unlike Hannibal's in passing the Alps, which Nat. Lee makes that hero relate in these ranting lines:

What after ages will with pain believe,
Through burning quarries did our passage cleave.
Hurl'd dreadful fire and vinegar infus'd,
Whose horrid force the nerves of flint unloos'd,
Made nature start, to see us root up rocks,
And open all her adamantine locks;
Shake off her massy bars, o'er the mountains go, etc.

After the stones are loosened, they use them in forming enclosures and ditches, which they seldom fail to make sufficiently thick, having no want of materials, and no other way to dispose of them.

Ballyvourney (i.e., the town of the beloved), 6 miles W. of Macroomp, is a small village and ruined church, seated on a hill to the south of the river Sullane, which runs due east from this to Macroomp, having its rise a little more to the west. The church is dedicated to St. Gobnate, who, in the 6th century, was made abbess of a nunnery of regular canonesses here by St. Abhan. It was also called Husneagh, Borneagh, and Burneagh. She is said to be the daughter of O'Connor Sligo. This church is 104 feet long, by 24 broad; the steeple is ready to fall with age. On the north side of the altar is a tomb of the O'Hierlys, who were the ancient proprietors of this rugged country. North of the river stood an old castle of theirs, which is now an heap of stones. The Irish visit this place on Whitsun-Mondays and on the 14th of February, which last is the patron day of this saint. About 30 yards from the west end of the church there is a small stone cross, where her rood or image is set up on those days. Here the devotees (which are only the more simple and ruder Irish) go round it on their knees, and repeat a certain number of prayers. They also tie their handkerchiefs, &c., about its neck, which they imagine will preserve them from several diseases. Near this cross is a stone fixed in the ground, and worn by the knees of those who come here in pilgrimage; and adjacent is a well dedicated to this saint: the water is pure, soft, and light. A little to the north of this well is a circle of stones, about 2 feet high and about 9 feet in diameter, which seems to be the foundation of one of the small round towers placed in churchyards: round this and the well there are paths worn by the knees of the devotees. The image is kept in a chest very private, and never exposed but upon festival days and when it is carried to sick people. When I was there, the person who had charge of it told me it was carried into Ivelary, an adjacent wild tract, to be sworn upon.

This church (23) is seated on a small green spot, on the side of an hill, from whence is a fine view of the Kerry mountains, which, like an immense wall, are ranged several miles from north to south, and divide both counties. They are mostly rude, naked rocks, of a prodigious height, being worn into numberless furrows by the torrents which for so many ages have been flowing down their sides.

Sola jugis habitat diris, sedesq; tuetur
Perpetuas deformis hyems: Illa undique nubes
Huc atras agit et mixtos cum grandine nimbos.
Nam cuncti flatus ventique surentia regna
Alpina posuere domo, caligat in altis
Obtutus saxis, abeuntq; in nubila montes.
Silius Ital. lib. 3.

Here hoary winter, unadorn'd and bare,
Dwells in the dire retreat and freezes there;
There she assembles all her blackest storms,
And the rude hail in rattling tempests forms;
Thither the loud tumultous winds resort,
And on the mountain keep their boist'rous court,
That in the thick show'rs her rooky summet shrouds
And darkens all the broken view with clouds.
—Addison.

West of the church is a good echo, which is thrice repeated; there was formerly a ring of small bells in the steeple. By the situation, the sound must have been variously reverberated from the adjacent hills. This is the estate of Nicholas Colthurst, Esq., and the only improvement for some miles round is at Killeen, a good farmhouse of Mr. James Colthurst, lying about a mile to the N.E. About 4 miles N.W. of Macroomp are the remains of a Danish intrenchment of an oval form; the greatest diameter is 60 yards, and the smaller 40, surrounded by a broad, deep ditch, whose sides are almost perpendicular. It has one narrow path into it, facing the east. At a small distance from it, near the roadside, are 5 very large stones, pitched endways, forming an equilateral triangle, whose inside area may contain a dozen persons.

The north-west of the barony (from Macroomp to the Blackwater) is rough and uncultivated. About six miles from Macroomp is Caum-Carig (i.e., the crooked rocks), a rugged hill, which must be passed over before one arrives at Mill-street. On the left the eye is entertained with various prospects of the Kerry mountains above-mentioned. The last of the range to the north is a lofty cone, called Clara-hill; at the foot of it is Mount-Leader, a good house and plantations of Mr. Edward Leader. On the left is Kilmeedy, a small castle of the O'Donaghoes, now in ruin; near which was a redoubt for half a foot company. As one descends the hills, the country opens all green and charming towards the Blackwater. Mill street is the last village of any consequence in this part of the barony; the new turnpike road from Cork to Kerry runs through it, being carried over the Boggra mountain; a new barrack and some manufactures in the linen trade, intended to be set up here, will soon make it a place of some note. About a mile to the east is Drishane, an high castle, built by Dermot Mac-Carty, son to Tiege, Lord Muskery, who died in 1448. In 1641, Donogh Mac-Carty joined the Irish, and forfeited this estate; near the castle is a new, handsome house of the late William Wallis, Esq., who had considerably improved this part of the country by manuring with lime, enclosing, planting, &c. Having mentioned everything considerable in this barony on the north side of the river Lee, I shall return south to Macroomp, and finish an account of that part of it lying on the south side of the river (24).

(To be continued.)

(23) The following indulgence was granted by Pope Clement VIII to such as go in devotion to this church.

"Universus Christi fidelibus præsentes literas inspecturis salutem and apostolicam benedictionem, ad augendum fidelium religionem and animarum salutem cælestibus ecclesiæ thesauris pia charitate intenti, omnibus utriusque sexus Christi fidelibus vere penitentibus and confessis ad sacra communione reflectis qui ecclesiam parochialem sanctæ Gobonatæ loci Ballyvorni Cluensi diosc. die festo ejusdem sanctæ Gobonatæ a primis vesperis usque ad occasum, solis prædicti festi singulis annis devote visitaverint, et ibi pro Christianorum principum concordia, hæresum extirpatione, ac sanctæ Matris ecclesiæ exaltatione pias a Deum preces effuderint, decem annos and totidem quadragenas de injunctis eis seu aliis quomodo libet debitis pœnitentiis in forma ecclesiæ consueta relaxamus. Præsentibus ad decimam duntaxat, valituris, volumus autem, quod si alias Christi fidelibus dictam ecclesiam visitantibus aliam indulgentiam perpetuo, vel ad certum tempus nondum elapsum duraturam concesserimus præfentes nullæ sint. Datum Romæ, apud sanct. Marcum sub anulo piscatoris die 12 Julii 1601, and pontificat nostr. anno decimo." From the Lambeth library, lib. N. N. numb. 77.

In the parish of Kilshanick, in a mountainy tract, there is another well, dedicated to this Saint Gobnate, which is also visited on the 14th of February.

HYMN TO THE SEA.

Roll on, roll on, thou "melancholy sea,"
That bearest on thy breast my love from me;
I stand beside thee, and I gaze upon
The fading vessel that will soon be gone.
Oh! bear him safely, though away from me;
Rage not in storms, but murmur tranquilly;
Make him remember her who thinks on him,
And weeps, and watches, till her eyes grow dim—
Thou melancholy sea!

Blue sea, I chide not, though I am sad,
And all in mournful hues thy waves seem clad;
But once I loved the surging billows' spray,
And thought their music ever blithe and gay;
Now I am sorrowful, and in thy moan
I think I hear a drowning sailor's groan;
Thy waters leap on high, but seem to me
To sing of shipwrecks with a fiendish glee—
Thou melancholy sea!

Roll on, roll on, ye light and sportive waves,
Ye look not as ye roll'd o'er sailor's graves:—
And I do smile, and jest, and gaily sing,
To hide the deep-felt pang my heart doth wring.
Like thee, blue sea, beneath a smiling face,
I bear deep Anguish none may haply trace;
A careless mien, and jesting tongue may hide
Griefs, like sunk rocks beneath thy swelling tide—
Thou melancholy sea!

Bear on that barque, and take her safe to port,
Change not to rudeness thy now graceful sport:
In fervent prayer I kneel upon thy shore,
For blessings on the form I see no more.
Blue ocean! parting those who love so well,
What wonder if thy roar should seem a knell?
Too oft thou rollest o'er a cherish'd head,
Too oft our lov'd ones find an ocean bed—
Thou melancholy sea!

(24) The Lee runs through the centre of the barony of Muskery, dividing it into two parts, north and south. The north part (above described) is bounded on the west by the lands of Glanerought and Glanflesk, in Kerry; and towards the north-west, it extends to the Blackwater, which divides it from Duhallow. part of which being on the south of that river, bounds it, till it meets with the Barony of Barrets, which divides and separates it on the east end; this separated part is bounded on the east by Fermoy and Barrymore, as the map shows. The south part of this Barony is bounded on the east by the liberties of Cork and the barony of Barrets; on the south by Kinalea, Kinalmeaky, Carbery, and the lofty mountains of Dauce and Duhil, which divide it from Bantry. It is on the south side 26 miles long; on the north more than 30; and about 16 miles broad.

Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

DONERAILE, a market and post-town, and a parish (formerly a Parliamentary borough), in the barony of Fermoy, county of Cork, and province of Munster, 21 miles (N. by W.) from Cork, and 132 (S.W.) from Dublin; containing 6,940 inhabitants, of which number, 2,652 are in the town. Sir William St. Leger, who was Lord-President of Munster in the reign of Chas. I., held his court here. He purchased the Doneraile estate of Sir Walter Welmond and John Spenser (son of the poet), which purchase was subsequently confirmed by the Crown, and the estate created a manor. In the civil war of 1641, Sir William, both as a statesman and soldier, rendered important services; but his infirm health did not enable him long to sustain the hardships to which he was then exposed, and he died in the following year. In 1645, the Irish, under Lord Castlehaven, took the castle of Doneraile, and burned the greater part of the town.

It is pleasantly situated on the river Awbeg (the "Gentle Mulla" of Spenser), which is here crossed by a neat stone bridge of three arches, and on the mail road from Mallow to Mitchelstown; it consists chiefly of one wide main street, and a smaller one called Buttevant lane, and contains about 390 houses. The vicinity is extremely pleasing, the roads being shaded by fine fir and other trees, and the country studded with gentlemen's seats. By a charter of the 15th of Chas. I. (1639), constituting Sir William St. Leger lord of the manor, power was given to the seneschal to hold a court leet and court baron, with jurisdiction in personal actions to the amount of 40s.; also a market on Thursday, and two fairs annually on the feast of St. Magdalene and All Souls. By a second charter, granted in the 31st of Chas. II. (1660), the borough was empowered to return two members to the Irish Parliament, and the elective franchise was vested in the freeholders made by the lord of the manor; but no corporation was created: the seneschal was the returning officer. From this period until the Union it continued to send two burgesses to Parliament, when it was disfranchised, and the compensation of £15,000 paid to the heirs of Hayes, Viscount Doneraile.

Of the remains of antiquity, Kilcoleman Castle is the most interesting, from having been once the residence of the poet Spenser. It was originally a structure of some magnitude, the property of the Desmond family, and on their forfeiture was, with about 3,000 acres of land, granted by Queen Elizabeth, in 1586, to Edmund Spenser, who resided here for about 12 years, during which period he composed his "Faery Queene." The ruins, situated on the margin of a small lake, have a very picturesque appearance, being richly clothed with ivy; the tower staircase and the kitchen are still nearly entire, and one small closet and window in the tower quite perfect. The castle at Creagh is in good preservation, and about to be fitted up as an appendage to the family mansion. The ruins of Castle Pook still remain, but of Doneraile Castle, which stood near the bridge, and in which Sir William St. Leger held his court of presidency, there is not a vestige. Doneraile gives the titles of Viscount and Baron to the family of St. Leger.

QUEER MUSICAL INSTRUMENTS.

It would seem that the aboriginal Americans were not without knowledge of the power of music. Among the many odd and grotesque-looking objects in the National Museum of America, relics of a mysterious people who once flourished on that continent, is a unique collection of musical instruments, many of which, however crude in appearance, give forth tones as sweet and clear as they did a thousand years ago. Nearly all of them are wind instruments, and are similar to the modern ocarina and flageolet. The more perfect specimens, as regards tone and workmanship, come from Mexico and Central and South America, and are made for the most part of very fine pottery, though some are fashioned from bones of animals and birds. The collection is under the supervision of Professor Wilson and E. P. Upham. Dr. W. H. Holmes, head curator of the American National Museum, has furnished many valuable specimens and data. Mr. Upham, referring to interesting qualities of the several instruments, said, taking up what might be described as a small occarino, fashioned in the shape of a bird, and furnished with a tapering mouthpiece:—

"This possesses four sound holes, and yields five notes, the low tone being produced with al the holes closed."

The instrument was in excellent condition, in proof of which Mr. Upham proceeded to play "There's No Good Luck About the House" with beautiful tuneful effect. It was remarkable that when blown without the fingers covering the holes, the sound resembled closely the clear and plaintive warbling of a bird, probably the same which the artistic maker had endeavoured to depict.

Many of the instruments are grotesque in design, representing chiefly animals and birds, but are in some cases of so complex a shape as to astonish one. The majority possess either two, three, or five notes, although some are capable of wider range; and while the inference is that the pre-historic musicians possessed a musical scale radically different from our own, all those instruments can be made, by proper manipulation, to furnish notes to their respective capacities in the chromatic scale.

One of the richest and most melodious tones was produced from a very unattractive looking earthenware alligator, although, unfortunately, the capacity of this musical novelty, or rather antiquity, was limited to three notes. A most piercing and penetrating sound was produced from a tiny whistle, which could be easily held in the palm of the hand and enclosed by the grasp.

One of the most extraordinary shapes is that of the flageolot, from the Aztec ruins of Mexico. The religious symbols found upon the ruins of Aztec temples are also seen upon many of these instruments. There are some of the flageolots which in all probability date from historic times. One from Mexico, carved in marble, which has six holes, all those of prehistoric periods never being furnished with more than four, is illustrative of this fact.

One instrument from Nicova, Costa Rica, is unique from the fact that, while it contains but four sound holes, seven notes can be produced from it. It is in the form of a grotesque human head, with painted decorations in brown and red on a yellow ground. The mouthpiece is attached to, and forms part of the head dress. Its exceptionally wide range is owing to the fact that one of the four holes is larger than the others, the result being two additional notes that would not be obtainable were all the holes of the same size.

A unique specimen is a whistling vase from Costa Rica, which was presented to Professor Wilson by Senor Rafael Iglesias. It is round-bottomed, with a handle on one side representing an animal head holding the edge of the rim in its mouth. The rim and lower half of the vase are dark red, the space between being filled by a broad chevron band in brown and yelow, the whole surface being highly polished. The air passages from the inside of the vessel connect with a vent hole on the outside of the animal's neck. To produce a sound or note, the lips must be placed against the mouth of the vessel in the same manner as would be done on the large brass instruments of to-day. Its one note is exceedingly shrill and piercing.

Another remarkable specimen is a primitive flageolot made from a slender bone, probably from the wing of the brown pelican. The natural cavity at one end of the bone is partly filled with wax or gum, leaving an air passage which connects with a vent hole, forming a mouthpiece. The other end is open. On the upper surface are five small finger holes, placed about seven-sixteenths of an inch apart.

THE SEAMAN'S LIGHT.

BY JOHN FISHER MURRAY.

In darkness the sky and the ocean were blending
As we steered for our own native isle in the west
A twinkling light o'er the waters extending
Its lengthening ray, gave us hope of our rest.
Oh! 'twas sweet, that soft light, from the harbour in sight—
As we dashed through its track, it said, "Welcome, boys, back!"
Yet I longed for another—the twinkle that shone
Where my Susan kept watch, in our own little home.

No longer by duty on shipboard delayed,
Our frigate at anchor, my messmates at rest,
My parting salute to the officers paid,
Like an arrow I flew to my own little nest.
'Twas a year and a day we had sailed from the bay,
Not a scrape of a pen had I fingered since then:
And my poor heart was fearful some evil had come
To my babes or my Sue, or my snug little home.

The grog-shops were full, and the fiddles were playing,
Old messmates would hail me, and offer me prog;
But Homeward I steered, without stopping or staying—
My heart was too full for their victuals or grog.
I knew 'twas all right—there twinkled the light;
Up the stairs, then, I flew—"Are you there, my sweet Sue?"
Like an echo she answered—"Dear Jack, are you come?
"'Tis a year and a day since you parted from home!"

If I was to be made a post-captain, believe me,
I could not have then been a happier man:
The girl by my side that would never deceive me,
My babes on my knee, and a full-flowing can.
Oh! sweet was her smack, and the little ones' clack,
And sweet on my welcoming glass was the foam:
And though but a rushlight, I ne'er saw, day or night,
A light to compare with the light of my home.

Then, here's to our frigate, the old Madagascar,
And here's to each messmate the best I can wish—
May the girl of your heart still be kind when you ask her;
May a friend share your glass, and a friend heap your dish;
May your ship still have luck, boys, to swim like a duck,
Whenever across the wide ocean you roam:
And joy to the life of the jolly tar's wife,
Who watches for him by the light of his home.

LITERARY NOTES.

Christmas Eve was the anniversary of the birth of Crabbe, the poet (1754). We understand that preparations are being made to celebrate in Aldeburgh, his birthplace, the 150th anniversary of the birth of the poet.

✧ ✧ ✧

Last Wednesday was the thirty-ninth anniversary of the death of Thackeray. Two years before that event the novelist journeyed to Ayr to perform the last rites for his step-father, Major H. W. Carmichael Smyth, the original of Colonel Newcome, who died and was laid to rest in the old burying-ground of that town. On the last five Christmas Eves, it may also be recalled, an unknown admirer has laid a bunch of violets, with the words, "And his heart throbbed with an exquisite joy," on the bust of Thackeray in Westminster Abbey.

✧ ✧ ✧

An important work on political economy has just been made accessible to readers in these countries:—"The Principles of Economics," by Dr. N. G. Pierson, a translation of which by Mr. A. A. Wotzel, will be published shortly by Messrs. Macmillan. This publication has for some time been wished for by such economists as Professor Edgeworth, partly because of the special interest attaching to the work of a writer on economics who is also an experienced politician, but chiefly because of Dr. Pierson's gift for dispensing with terms of erudition in expounding the theories of his science.

✧ ✧ ✧

R. L. Stevenson was quite delighted, as an unknown author, at the modest fee he received from James Henderson for his "Sea-Cook," which the publisher of "Young Folks" baptised "Treasure Island," a name it has been known by ever since. The serial payment, often more than that for the volume, is a happy arrangement for juvenlie story-tellers. But from this it will be seen that it is anything but a lucrative business, and no imaginative writer with a great vogue could afford to devote his days and nights to such work.

✧ ✧ ✧

There has been no great literary sensation in 1902, unless the sudden fame of Maxim Gorky or the storm in Mrs. Gallup's teacup may count for such—only Mrs. Gallup's epoch-making work was not, as a matter of fact, an event of this year. The only other sensational event was the flitting of the now too famous phrases of "flannelled fools" and "muddied oafs" at our cricketers and footballers by Mr. Kipling in his poem of "The Islanders" in the "Times." This was a poem, as somebody has said, that people read who only read prose, and its fame accordingly greatly exceeds the fame of any other poem published during the year.

✧ ✧ ✧

The literary death roll has been a long one. Two deaths of authors have been tragedies, those of Paul Leicester Ford, a brilliant young American writer, and of M. Zola. Gone are such widely different veterans as Mr. Aubrey de Vere and Mr. Bret Harte. Mr. Lionel Johnson, too, is another brilliant young writer who has gone over to the majority. Scholarship has lost Professor Gardiner and Lord Acton. Not least pathetic was the death, at thirty-three, of George Douglas Brown, whose "House with the Green Shutters" showed quite uncommon powers. He will not be forgotten in the new year, a memoir of him being promised for January.

✧ ✧ ✧

Of the much good and solid work now being done in historical research it is for the experts to speak, but among the books of the year dealing with historical matters (remarks a reviewer), I cannot do wrong in recommending Mr. Holland Rose's "Life of Napoleon," especially to readers who took Lord Rosebery's "Last Paradise" seriously. Mr. Douglas Murray has done an invaluable service, too, in making available the authentic report of the trial of Jeanne d'Arc; no romance could exceed this document in piquancy or more exalt this wonderful young heroine and martyr. Mr. Nichol's translation of the letters of Erasmus, if allowed to count among the books of the year, published as it was at the close of 1901, must count among the most valuable.

✧ ✧ ✧

Lady Gregory, in her volume, "Cuchulain of Muirthemne," has to some extent done for a famous cycle of mediæval Irish tales what Lady Charlotte Guest did for the mediæval Welsh tales in her well-known version of the Mabinogion. The influence of Lady Charlotte Guest's work is a matter of literary history, and it is pleasant to have to chronicle the publication of this year of two cheap but scholarly editions of her "Mabinogion," while another is about to follow in the "Temple Classics." Mr. W. B. Yeats added some new essays to the new edition this year of his "Celtic Twilight." Another book of essays, "The Roadmender," by "Michael Fairwell," an essayist of promise who unhappily died last year, has run through no less than six editions within the year, a rare fortune for a book of essays.

✧ ✧ ✧

Mr. G. A. Henty, by far the most popular writer of boys' books of our time, and responsible for some seveity volumes, left, as we announced recently, between £5,000 and £6,000, certainly no large amount considering his great vogue. It will be remembered that after R. M. Ballantyne died at Rome—a boy's writer dear to all young folks, and Henty's predecessor—subscriptions were asked on behalf of those who had been left behind. When Ballantyne began to write for young folks, at the suggestion of Mr. William Nelson, his prices were very small; latterly he had a good royalty on his five-shilling books. Mr. G. M. Fenn, the next most popular writer to Henty, may rreceive £100, or a little more, for one of his five-shilling volumes of adventure; Mrs, Meade, a popular writer for girls, may command about the same amount.

✧ ✧ ✧

In a 400-page volume, entitled, "Musicians' Wit, Humour, and Anecdotes," which is published by the Walter Scott Publishing Company, Mr. Frederick F. Crowest has collected a vast number of stories, famous and otherwise. Here is a specimen with a moral attached, which is that people in their desire to pay compliments, do sometimes make consummate fools of themselves:—"A countess paid M. Gounod a visit at his villa in St. Cloud, and arriving about lunch-time, she pased through the dining-room, where the servants were clearing the table, and saw some cherry-stones lying on a plate. The maestro had just been partaking of his solitary meal, his family having gone to the seaside. Picking up one of the stones, she thrust it into her glove. Soon after M. Gounod returned the lady's visit, when she displayed to him the brooch she was wearing: it was the cherry-stone set with diamonds. The countess explained how she had secured the cherry-stone, when Gounod remarked, 'I never eat cherries; it is my footman, John, who eats all those he brings on the table.' The lady certainly had reason honestly to congratulate herself that she had not swallowed the stones!" The following story, if true, is an example of how great composers seek the applause of the gallery:—"When Verdi was putting the last touches to 'Il Trovatore,' he was visited in his study by a privileged friend, who was one of the ablest living musicians and critics. He was permitted to examine the score, and run over the 'Anvil Chorus' on the pianoforte. 'What do you think of that?' asked Verdi. 'Trash!' responded the connoisseur. Verdi rubbed his hands and chuckled. 'Now look at this,' he said. 'Rubbish!' said the other, rolling a cigarette. The composer rose and embraced him with a burst of joy. 'What do you mean?' asked the critic. 'My dear friend,' cried Verdi, 'I have been making a popular opera. In it I resolved to please everybody except the purists, the great judges, the classicists, like you. Had I pleased you, I should have pleased no one else. What you say assures me of success. In three months "Il Trovatore" will be sung, and roared, and whistled, and barrel-organed all over Italy.' And so it proved."

✧ ✧ ✧

This anecdote about Mascagni is not new, but it is one of the best of the bunch:—"A peripatetic pianist was grinding out the inevitable 'Intermezzo' beneath Mascagni's window one morning, and was giving it at such a rapid tempo, that the composer could no longer stand quietly and hear his composition murdered. Rushing into the street, he seized the handle of the instrument and turned it at the proper pace, explaining to the astonished organ-grinder that he had composed the piece, and would like to show him how it should be given. The man was angry at first, but when he realised the honour he had received by having a lesson from Mascagni himself, he evidently conceived an idea—he broke into a broad grin. The next morning he appeared before the composer's house with a huge placard in front of his organ, inscribed, 'Pupil of the celebrated Mascagni.' This was 'turning the tables' indeed." Here is a similar incident related about Rossini with a different ending:—"The peculiar hardship of the street organ is that there is no remedy. Some have tried severity—with no effect upon anything except their tempers. Those who try kindness meet with the same result: the nuisance is aggravated, and each penny bestowed tends only to increase the visits of the smiling, greasy-faced son of the South. Rossini once took the matter into his own hands. When he lived in the Rue de la Chaussee d'Antin, he found one day in front of his house a poor old fellow who was grinding out 'Di tanti palpiti' on a barrel-organ. The passers-by stopped. All at once a voice from their midst cried, 'Quicker, quicker!' 'How so, sir' 'Turn your handle quicker, it is allegro.' 'But, sir, I don't know——' 'Do it so—so!' and Rossini, recognised by no one, steps up to the organ, and grinds away at the pace he wished. 'Thank you, sir; I'll remember the lesson.' Next day the organ stops again and plays 'Di tanti palpiti,' this time in the manner taught the day before. 'Bravo!' cries a voice from the opposite house. 'Bravo, bravo, abravo!' and a louis-d'or falls at the feet of the itinerant artist. It was Rossini again. Of course the organ-grinder was delighted, and for his own comfort Rossini was, beyond doubt, unwise. A lesson to every 'grinder' by all means; but the louis-d'or would be a fatal mistake!"

✧ ✧ ✧

There were some curious items included in the sale of the late Mr. Craik Angus's collection of "Bursiana" in Edinburgh recently, in the shape of early editions of Burns, containing the autographs on the title pages of such celebrities as Patmore, Mr. Swinburne, Browning, Morris, Mr. Meredith, Stevenson, Gladstone, Manning, Newman, Mr. Stanley, Keene, Mr. Lang, Mr. Morley, Mr. Whistler, Mark Twain, and Mr. Labouchere. It is not to be presumed, however, from the appearance of these names on the title pages of the various volumes that the works were at one time in the possession of the persons whose autographs are affixed. In the "notes" issued as supplementary to the sale catalogue, the cat is let out of the bag. Here we have the naive confession that the late Mr. Angus sent from Glasgow to Samoa four books, with the request that Stevenson should put his autograph in each. This Stevenson did, confessing, however, that as he "scrawled his vile name" on them, he "thought shame as he did it." And no wonder. The four books and the letter were included in the sale. We have heard, the "Academy" remarks, about audacity in the means used to obtain autographs, but this method of adding to the value of a book is thoroughly original.

SCIENTIFIC TOPICS.

Of the engines running on the Russian railways, 4,776, or 39 per cent, were built abroad, and 7,421, or 61 per cent., in Russian engine yards. The St. Petersburg and Warsaw Railway has the greatest number of passenger engines, namely, 210; then come the South-Western Railways with 172, the Moscow, Yaroslav and Archangel Railway with 124, and the South-Eastern Railways with 104 locomotives, while the remaining lines have each less than 100 locomotives at work.

✧ ✧ ✧

At the present time, in the middle island of New Zealand, there are about 240 dredges, costing from £5,000 to £14,000 each, in course of construction or ordered. Dredges are at work or about to work on the following rivers —Molyneux, Clutha, Kawarau, Manuarhekai, Dart, Shotover, Lindis, Waiau, Mataura, Waipori, Nevis, in Otago and Southland; in the Westland and Nelson on West Coast; on the Totaru, Hokitika, Grey, Ahura, Buller, Inanghua, and Orwell Creek. There are also a great number of gold-bearing flats which are being dredged.

✧ ✧ ✧

Two electric locomotives, ordered by the Baltimore and Ohio Railroad Company from the General Electric Company, are said to be the two largest electric locomotives in the world. Each machine will weigh 150 tons, and be capable of drawing 1,500 tons of freight up the heavy grades of the belt line tunnel, which runs nearly two miles under the city. Passenger trains have been drawn through the tunnel by electricity since it was opened in 1895, but the locomotives now in use are not capable of pulling the heavy trains. The new machines will be designed to haul a load equal to twice that drawn by the present steam locomotives.

✧ ✧ ✧

B. Brauner has examined all the possible positions of the metals of rare earths in Mendelejeff's periodic system. He arrived at the conclusion that this group of elements may present some analogy with the group of asteroids in the solar system, forming in the periodic system, a sort of link between a cerium and the unknown element of the atomic weight 180. This interperiodical group is thus the continuation of the eighth line, terminating with the tungsten-platinum elements; gold is shown to be the first term of the ninth, and not of the eleventh line. The first element of the twelfth line is probably radium, followed by thorium and uranium.

✧ ✧ ✧

Interesting experiments have been conducted by Dr. Lemstrom, of Helsingfors University, on the effect of an electrical discharge on the growth of plants. Four seeds of barley, wheat, and rye were sown in pots, the soil being electrically connected with the ground. Above the two pots was suspended an insulated network of wire with a number of points of a Holz machine so connected that in some of the pots the electric current passed from the metal work to the earth, while in others it passed in the reverse direction. For five hours daily a current was passed through the soil. After eight weeks the height of the plants affected by the electric current was found to be about forty per cent greater than those to which no current had been applied. It is said that experiments with other plants show similar results, but different in degree.

✧ ✧ ✧

The option held by the Continental Trust Company to purchase the common stock of the United Electric Light and Power Company and the stocks and bonds of the Mount Washington Electric Light and Power Company was exercised on November 15th. The syndicate will secure power from the Susquehann River. The introduction of electric power derived from the force of the Susquehanna River will have a vast influence on the manufactures of Baltimore. It is estimated that the cost of lighting the city can be reduced to about 20 dollars per year per lamp, if the city maintains its own distributing plants. It now costs the city 99 dollars 12 cents for each arc lamp under a contract which expires in September, 1905. It is hoped that the industrial growth which accompanied the introduction of electric power at Niagara Falls will find a parallel at Baltimore. Plants of 60,000 gross horse power are planned.

✧ ✧ ✧

Rear-Admiral R. B. Bradford, Chief of the Naval Bureau of Equipment, has recommended to the Secretary of the Navy that the Government secure control of all wireless telegraphic stations on the coast of the United States. Unless this is done, Admiral Bradford believes that there will be interference in the transmission of wireless messages between stations of private companies within the same circuit. Foreign Governments are exercising careful supervision over the location of wireless stations for strategic reasons. Admiral Bradford in his report states that he had not been able to arrive at any satisfactory conclusion with the Marconi Wireless Telegraphy Company, for the reason that he can obtain instruments only on the payment of royalty. He states that most naval Powers are far in advance of the United States in the installation of wireless telegraphic appliances on board naval ships, but he believes that no ground has been lost by reason of the slow progress made.

✧ ✧ ✧

A new process for making incandescent lamp filaments has been invented by M. de Marc, of Brussels. His object is to form a core of magnesia upon which is deposited a layer of carbon, thus giving a filament which has a greater mechanical resistance than the ordinary carbon filament. To obtain the core a mixture of magnesia, tar, and powdered carbon is made and the pasty material is formed by high pressure into filaments or bands of the proper diameter. The filaments are then heated in a gas furnace at a high temperature in order to solidify them and produce a partial combustion. After coming from the furnace the filaments are very hard and resistant. They are then placed in a chamber in rarefied air or a gas containing oxygen and a weak current is sent through them in order to produce a combustion of the carbon and leave only the magnesia which forms the base of the core. In fact the carbon begins to burn at the exterior and the combustion proceeds toward the interior of the filament, while on the surface is formed a solid layer of magnesia. After this preliminary treatment they are burned in free air until all the carbon is consumed. In this way a small tube of pure magnesia is obtained, which is then to be coated with carbon to form the lamp filament. For this it is treated by a flash process, like that of a carbon filament, in an atmosphere of hydro-carbon gas, and the filament when raised to incandescence receives a deposit of carbon on the surface. Thus prepared, they are mounted in a bulb to to form the lamp. The inventor claims that the lamps formed according to this process have a great mechanical resistance.

✧ ✧ ✧

The gas works of Tunis now have an electric plant which presents some new features. It uses retort carbon in a gas generator of the Pierson type, which produces a low carbon gas. The plant includes two small boilers of 20 square yards heating surface and three gas generators with their various accessories, including a gasometer of 330 cubic yards capacity. The generator has a double envelope and a horizontal grate surface. The outlet tube for the gas in enclosed in a second tube of larger diameter, and the mixture of air and steam is injected through the annular space between the tubes. The gas comes out at a temperature of 450 deg. C. The heat lost by the outgoing gas is partly restored by the above arrangement for heating the air and steam. The latter mixture passes under the grate and traverses the incandescent mass of coke, and the gas thus formed passes out into a condenser, then to the scrubbers, and finally to the gas tank, from which the motors are supplied. The gas engines are of the Crossley type, and four of these are used at present, having a capacity of 105 horse power each. To them are connected the dynamos for the lighting circuits. The gas producers of the Tunis plant are fed from retort carbon coming from the gas works adjoining, and the product is thus utilised to good advantage. The gas motors are arranged so that they can be fed either by coal gas or by producer gas. To carry out this there are two sets of piping, and a series of valves throw on one or the other gas without having to stop the motors or produce a flickering in the light.

✧ ✧ ✧

A unique specimen of an Egyptian tool has been received by M. Albert Colson, of Paris, who gives an account of its fabrication and the character of the metal. The tool is a cold-chisel of the time of the Sheban dynasties, formed of a hard bronze blade whose present thickness is 0.12-inch and width 0.72-inch. The cutting bevel is made at an angle of 60 to 65 degrees. This hard alloy is inserted in an outer covering or sheath of soft and malleable bronze 0.6-inch thick, which covers it quite up to the cutting edge. This outer sheath has been either used as a mould for the central part or been added outwardly by hammering at a high temperature. In any case it is effective in giving the hard and brittle metal of the tool the elasticity necessary for receiving the shocks of the hammer. This artifice is analogous to that used at present in automobile construction for obtaining parts which are resistant alike to wear and to shocks; the pieces are made in soft steel, and the parts exposed to friction are hardened by cementation. The non-cemented part preserves the elasticity of the piece, which if entirely hardened would be too brittle. In this case the soft steel is in the interior, while in the Egyptian tool the soft bronze is on the outside.

✧ ✧ ✧

The sheathing, unlike the central core, is of a laminated texture. The surface which separates the two alloys is marked by a black oxide, often stained with verdigris. The two alloys were separated, and after cleaning were found to have different densities. The envelope, although more oxidised, gives d—5.33 and the core d—5.18. This anomaly showed that the former is richer in copper than the latter, as was proved by analysis. If a part of the tool is reduced by hydrogen near 500 deg. C., the envelope takes a red copper-colour and the interior a buff-yellow. The following shows the composition of the bronzes which compose the two parts. After cleaning the alloys were reduced by the blow-pipe and found to lose in each case about 15 per cent. of oxygen and 3 or 4 per cent of carbonic acid, sulphur, chlorine, etc. Then followed the analysis of the reduced metal:—

	Envelope.	Central portion.
Oxygen	1.65	1.60
Chlorine and sulphur...	0.80	traces
Iron	0.70	0.30
Lime and potassa.....	,,	0.15
Tin	4.67	13.30
Copper	92.60	84.60

The hard bronze thus contains less copper and considerably more tin than the soft. The presence of chlorine and sulphur is due to the earth in which the tool had been buried. The lime and potash seem to come from the ashes of the fire which melted the alloy, for after reducing the powdered metal by hydrogen and treating with boiling water, the solution sometimes turns red litmus to blue. The lime is thus in the free state and the potash in the form of carbonate.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

LONDONDERRY, AUGUST 21, 1787.

Last Tuesday afternoon, about five o'clock, his Grace the Duke of Rutland, attended by his Aides-de-Camp, etc., honoured this city with a visit. His Excellency embarked at the water-side in an elegant boat, rowed by eight seamen in handsome uniform, landed at the Ship-quay upon a commodious stage erected for the purpose, under a Royal salute of 21 guns, and was received by the Mayor, Aldermen, and the rest of the Corporation in their state regalia. The streets being lined by the 16th Regiment, his Grace proceeded to the Town Hall, where he partook of a sumptuous ration was presented to him by Robert Boyd, Esq., their Recorder; after which his Grace went to the house of Sir Hugh Hill, Bart., where he stayed during his residence in Derry. At seven o'clock his Excellency returned to the Town Hall, where he partook of a symptuous dinner prepared for the occasion by the Corporation; the tables were furnished with every kind of viand which the season or country could produce. Among the number of exquisite dishes were seen, turtle in all its luxurious forms, fresh turbot and other delicious fishes, and a fine salmon of 80lb. weight, just taken out of the water; and the wines were numerous, abundant, and excellent. At night the whole city was most brilliantly illuminated; there were bonfires and demonstrations of joy in every quarter, and barrels of porter were given to the populace. About ten o'clock his Grace most obligingly came to the balcony, and, in a flowing bumper of sparkling champaign, drank prosperity to the city of Derry; and in another he politely drank to the health of all the citizens, wives, and daughters, amidst the repeated acclamations of the gazing, wondering crowds below.

On Wednesday his Excellency viewed the Cathedral, the city, and its celebrated walls; he then took boat at the quay, accompanied by a numerous suite, and the fine band of the 16th Regiment, which played the whole time his Grace was on the river, and produced a most pleasing effect. Captain Cary's brig again saluted his Grace with 21 guns. His Excellency this day dined with Sir Hugh Hill, Bart., one of the representatives in Parliament for this city. At night the house of John Coningham, Esq., our very worthy and respectable Chief Magistrate, was beautifully illuminated, and adorned with three handsome transparencies, representing his Majesty's arms, the Duke of Rutland's arms, and the arms of the city of Londonderry. There was a number of bonfires, and the populace were again regaled with plenty of porter and other liquors, who repeatedly drank long life to his Excellency and his beautiful Duchess, etc.

MONAGHAN, AUGUST 22.

A most daring robbery was perpetrated last night within four miles of this town. About nine o'clock a number of villains, with their faces blackened, broke into the concerns of Mr. Hughes, a respectable farmer, and after placing a guard on an out-house, in which no less than 20 men, employed by that gentleman in making up the harvest, were lodged, entered the dwelling-house, and robbed him of cash and plate to the amount of £140. There were several bonds, and other papers of value in the drawers where the cash was deposited, but, at Mr. Hughes's entreaty, they suffered them to remain, and departed with their booty without offering further resistance.

DUBLIN, SATURDAY, AUGUST 25.

On Thursday last the Aldermen, Sheriffs, Peers, the Common Council, Masters, and Wardens of the several Corporations were most sumptuously entertained at the Mansion House in Dawson street, by the Right Hon. the Lord Mayor, where every thing was conducted in that splendid manner which has hitherto distinguished his Lordship's Mayoralty.

On Thursday last a complaint being made to Mr. Crosbie, one of the clerks of the markets, of a butcher using fraudulent weights, he went to his stall, and in exercising his duty received the greatest abuse accompanied by the most menacing threats, upon which he brought Mr. Sheriff Fleming and a party of the military into the market, took the fellow before Alderman Moncrieffe and lodged him in Newgate; who we hope for the good of the public will be brought to condign punishment.

A Bill, we hear, will be solicited the next session by the inhabitants of the city of Cork, to establish Commissioners for widening the avenues and streets in that city, invested with the same powers of the Dublin Commissioners; the expense of which it is proposed, shall in like manner with ours, be defrayed by a local tax or duty upon coals imported thither from Great Britain.

A correspondent gives the following statement of the inhabitants of Ireland at this day:—

In the army, including invalids	12,000
In the service of the revenue	4,000
In useful labour employed	600,000
Children	400,000
Employed in Manufactures	520,000
Mariners, fishermen, and boatmen ...	46,000
Handicrafts and tradesmen	580,000
Merchants	2,500
Shopkeepers, dealers, and pedlars ...	260,000
Resident nobility and gentry	10,000
Clergy of all denominations	11,500
Men of the law, physicians, and surgeons	5,200
Unemployed, idlers, and vagabonds	550,000
Total population	3,001,200

CORK, AUGUST 20.

Saturday night, five villains with cloths over their faces, burglariously entered the house of Mr. Patrick Campion, of Ballyhooly, beat and afterwards tied him, put a table-cloth over his head, and made him stand inside the curtain of his bed, while they robbed the house of plate, seven guineas and a half in gold, some silver, his watch, and wearing apparel to a considerable amount. The alarm being given in this town, Mr. Johnson, one of the High Constables, with a few of the Blackpool Association, pursued the gang yesterday to an house at Fair Hill, where they took two of them—viz., Owen M'Guire and Patrick Clanchy, with all the articles stolen, except the watch. They found also on them two brass horse pistols, and Mr. Campion's knee-buckles. They were committed to jail and sworn to. It appears that these are the gang of Broderick Walsh, otherwise Captain Barry, who was one of the three that escaped in consequence of Mr. Johnson's attention to secure the property.

DUBLIN, MONDAY, AUGUST 27.

It cannot be unpleasant to the friends of Ireland to observe that our native spas and other watering places are now attended by crowds of the best company. Swadlinbar, whose mineral springs are excellent for gouts, rheumatisms, and nervous complaints, has been so well frequented for a month past, that lodgings are let at enormous price to the great emolument of that poor town. Mallow as usual abounds with the beaux and belles of Munster. Ballyspellin partakes of the general taste for native amusements and health, got cheapest at home without visiting foreign climates. Amongst these, our neighbour, Lucan, holds at present a very high rank in the catalogue of mineral springs, there being upwards of one thousand persons, most of whom are in genteel life, quartered in and about that agreeable village and its charming environs; balls, breakfasts, and evening parties, are as regular and well conducted as at Bath, Tunbridge, or Scarborough; a circumstance which does no small honour to the taste of our gentry, who, on trial, can find as great benefits at home as if they made an expensive trip to the Continent.

Extract of a letter from Carrick, August 18.

"On Friday evening last, about seven or eight o'clock, three men came to the house of Mr. William Walsh, of Ballyleskin, in the barony of Knoctopher, and requested lodging; said Walsh informed that Mullinavat was near, desired them to go there; they then asked for something to drink, on which they were presented with milk, being the best the house afforded. One of them asked another for a warrant, and immediately two more of the party, who lay concealed near the house, rushed in, and the whole five produced fire arms from under their clothes, and snapped at the man of the house and his servant man but luckily without effect, as none of the pieces went off. Walsh then struck one of the villains with a Newfoundland hatchet on the head, and he instantly dropped; the servant, in the interm, stabbed another with a pike, on which the four made off, but shortly afterwards returned and carried off the body of their companion, supposed to be dead. In their flight one of the party dropped a pistol, which is now in the possession of the Rev. Mr. Hewetson, a Justive of the Peace for the county of Kilkenny."

DUBLIN, TUESDAY, AUGUST 28.

It is with pleasure we are informed that one of the West Indiamen arrived here in the course of the last week, has brought over orders for vesting the whole net proceeds of her cargo in the manufactures of this kingdom.

A considerable quantity of the new coinage, gold and silver, has arrived, and is getting into circulation. The impression on the guineas is not so sharp as formerly, which seems better calculated for the purse or pocket, as the friction cannot have so immediate, or so powerful an effect upon it.

Extract of a letter from Wexford.

"On Wednesday last, the 22nd inst, died here, aged 27 years, Mary Revell; about four years ago, there appearing strong symptoms of a dropsy, she came to this town, and was put under the care of Dr. Smyth, and by him and Mr. Miller Clifford, had been tapped one hundred and eleven times, and had nine barrels, thirty-three gallons, one quart, and one pint, of water taken from her—an instance, perhaps, not to be met with in the annals of physic."

Kelly and Crouch are gone to Norwich, after considerable success in Munster. The southern theatrical expedition has turned out this season flattering beyond expectation; and Crow street is putting into repair with a rapidity which gives if its being open early in the winter.

We hear that Thomas Plunket, Esq., means immediately to claim the title of Lord Baron Lowth, and to take his seat in the House of Lords.

BROWN'S CASTLE.

AN OLD DUBLIN CITY WALL TOWER.

ONCE THE RESIDENCE OF THE MAYORS OF DUBLIN.

ne ancient city wall of Dublin, from rmond-Gate, now named Wormwood-te, stretched up a steep hill to Newgate: tween these stood a square tower within e verge of the Marshalsea of the Four urts, commonly called the Black Dog, m the sign of a Talbot hung up there. This tower was known by the name of own's Castle, not as being the original founder, for the structure was co-eval with the first English settlement in Dublin, but from a later proprietor, Sir Richard Brown, who kept his mayoralty in this castle in the years 1614, 1615, and 1620, because the chief magistrate had no particular house for his residence; and in those turbulent times, a castle was best calculated for preserving the city regalia and records.

Dublin was now small and surrounded with a strong wall; this, at proper distances, was strengthened by castles and turrets, or small forts; there were fifteen. Brown's Castle was one of these, built at an angle to command that part of the Liffey which flowed up Bridge-street; for the citizens, as we may judge from the position of these fortresses, were more apprehensive of danger from the side of the river than that of the land. This view was drawn by T. Cocking, anno 1791.

SLIABH-NA-MON,

AND

Its Fenian Traditions.

SUPPLEMENTARY NOTES BY REV. J. F. LYNCH.

VII.

In the "Book of Rights," p. 18, it is stated that one of the geasa, or "restrictions," of the King of Cashel, was connected with Magh Feimhin, which O'Donovan says is described as extending from the River Suir northwards to Corca Eathrach, otherwise called Machaire Chaisil, from which it is evident that it comprises the whole of the barony of Iffa and Offa east, and O'Donovan refers to Colgan's "Trias Thaum," p. 201; "Keating's History of Ireland, reign of Cormac Mac Airt; and Lanigan's "Eccles. History of Ireland," vol. i., p. 282. Iffa represents the Irish Ui Fatha, and O'Donovan quotes from Keating in the reign of Cormac Mac Airt. Gleann Gara a n-Uibh Fatha; o Ghara Glundubh mac Morna —"valley of Gara in Iffa, named from Gara (or Garaidh) Black-Knee, son of Morna."

In "Cath Muighe Rath," p. 189, O'Donovan says that Magh Feimhin is a celebrated plain in the south-east of the county of Tipperary, extending form Knockgraffon southwards to the River Suir, and from Cahir to Sliabh na m-ban, and to the boundary of the Hy-Eirc, in the south of ancient Ossory. O'Donovan, "Book of Rights," p. 91 says that Knockgraffon is a townland in the barony of Middlethird, from which a parish is named; that there is a very large moat here surrounded by a fosse; that this was the principal seat of the Ui Suileabhain (O'Sullivans), till the year 1192, when they were driven thence by the English, who erected a castle close to the moat. On Knockgraffon, according to the "Book of Rights," was one of the royal forts of Munster, named Graffan and Rafann, hence the present Irish name, Cnoc-Graffan. The moat was named from Rafann, who is, in "Silva Gadelica," p. 524, said to be sister of Dala, Carmun, Imteng, Glaire, Brea, Grea, and Cairiu, said to be seven seers (sechtor faid), and sons of Tat, son of Ogamon, son of Beamon, son of Sru, son of Esru, son of Gaedhel glas. Keating ("Joyce's Edition," p. 125) has Dagda Oghma, Ealloid, Breas, and Dealbhaoth, sons of Eolathan, son of Ned, son of Indaoi, son of Allaoi, son of Tat, son of Tabharn, while in "Siabur-Charpat Con Culaind," p. 400, Ind Dagda is son of Elathan, son of Delbaeth, son of Net, son of Ind Ai, son of All Ai, son of Tat, son of Taburnd. Keating ("Joyce's Edition," p. 65) has Partholon, son of Sera, son of Sru, son of Esru, son of Fraimint, son of Fathachta, son of Magog. In "Silva Gadelica," p. 118, Slighe Dhala meic U moir, or "road of Dala, son of U Mor," is mentioned; and in "Silva Gadelica," p. 524, the Slighe Dala is said to be named from Dala glas of the Greeks of Scythia, or from Dala, son of Tat. O'Donovan, "Book of Rights," p. lviii., says that there were five great roads in Ireland named Slighe Dala, Slighe Asail, Slighe Midhluachra, Slighe Cualann, and Slighe Mor; and he says that it is mentioned in "Dinnshenchas" that these five roads, which led to the fort of Tara, were first discovered on the birth-night of Conn of the Hundred Battles.

Lughaidh O'Clerigh, in his poetical controversy with Tadhg Mac Daire, quoting the authority of Arne Fingin, says:—

Do Chonn ni misde a mhoidheamh,
A chomaoin air chrioch nGaoidheal;
Cuig priomhroid go port teamhra
Do frioth oidhche a gheineamhna,

which is thus rendered by Connellan ("Trans. O.S. Soc.," vol. v., p. 152):—

To Conn's great fame for ever let me tell
His obligations on green Erin's clime;
Five spacious roads to Tara's royal seat
Were first discovered on his famed birth-night.

O'Donovan says that Slighe Dala, which was also named Bealach mor, or "great road," was the great south-western road of Ireland, and extended from the southern side of Tara in the direction of Ossory. I think that Slighe Dala passed over the River Greece (so named from Gris ("fire"), daughter of Richis ("flame") connected with ford in Owney "Mesca Ulad," p. 53), by the ford of Ath Truisten (so-called from Tristiu, daughter of Dubhthach(31), or Dobhran of Dun Liamhna, now Dunlavan, in Wicklow, and wife of Ferdubh, son of Aicher and Luachair), beside Mullaghmast, or Mullach Maisten, "summit of Maistin," daughter of Oengus, son of Umor. The name Dala is properly in genitive case, and represents the Irish Dagla, for the letter G falls before L, in Irish words, and Dagla is genitive case of Dagail, from old root-dag, "to shine," which is also the root of Dagda, the genitive of Dagaid, who appears in the Munster tales as Deagha, son of Sin. One of the names of Mullaghmast, as noted by Lewis, was "Hill of Carmen," or Carmun, which is same as Carman. It appears from "Silva Gadelica," p. 524, that the name of the fort on Mullach Maisten was Dun Imteing, or fort of Imteng, son of Tat, and brother of Carmun and Rafann. I think that the fort at Naas(32) was named from Carmun, Loch Carman, or Loch Garman, and Carman is made son of Bomma Lecce, and is said to have stolen from Tara the mind, or "diadem," of the wife of Cathaoir Mor, who will be connected with Lough Gur. See also reference to Carmun in "Battle of Ventry," p. xii. It is possible that Lusmore, who is mentioned in connection with Knockgraffon, by Crofton Croker, is a survival of Rafann. Keating ("Joyce's Edition," p. 29) says that Dun gCrot (now Dungrud, near Galbally), and Dun Iasga (now Cahir), were the two royal palaces of the province of Eochaidh Red-brow. Dr. Joyce ("Irish Names," vol. i., p. 285), says that the full name of Cahir was Cathair-duna-iascaigh, "the circular stone fort of the fish-abounding dun," and he quotes from Petrie. "The 'Book of Lecan' records the destruction of the Caher by Cuirreach,, the brother-in-law of Felimy, the Law-giver, as early as the third century, at which time it was stated to have been the residence of a female named Badamar." O'Curry ("Lectures," p. 305), quoting from a poem ascribed to Oisin, which gives account of the Oenach of Cuirreach Life (Curragh of Kildare), says that the poet also gives a vivid account of a visit which in his more youthful days he had made along with his father, Finn, and a small band of the Fenian warriors to the court of Fiacha Muilleathan, King of Munster, at Badamanr, near Cahir, in Tipperary, and of the races of Oenach Clochair, which O'Curry thinks were held at the place, now called Manister, near Croom, in county of Limerick; but this, as I have proved, is a mistake, for Oenach Clochair and Oenach Culi Mna Nechtain are the same, and I think that the Assembly of Cuil was held on first of August beside Lough Gur. In "Silva Gadelica," p. 531, we are told that Fuinche, of the triple breasts, daughter of Firmora of the men of Cliu (Lough Gur district), was mother of the three Fothas, of Cahir Mor's son Currach, and of MacNiadh's son, Teite, and O'Curry ("Manners and Customs," p. 303), quoting from an old document, says that Fuinche of the triple breasts, daughter of Firmora, of the men of Cliach (genitive sense of Cliu), was mother of the three Fothads, and of Currach, son of Cahirmore, and of Teite, son of Mac Niadh. In "Pursuit of Diarmuid," part ii., p. 41, Crochnuit ("little ruddy one"), daughter of Currach Life, the son of Cahirmore, is said to be the mother of Diarmuid, the father being Donn O'Donnchudha; and Professor Rhys, "Hibbert Lectures," p. 506, says, "That the cropped king of darkness should be the father of the solar hero, Diarmait, is in no way surprising, as it amounts probably to not much more than another way of saying that the darkness of night precedes the light of day; and the way in which his mother is described suggests a dawn goddess associated with the Liffey; for she is called Crochnuit, daughter of Currach Life, that is to say, of the Plain of the Liffey, the unenclosed portion of which is now known as the Curragh of Kildare." Professor Rhys (note, p. 678), says that those goddesses who are loosely treated by him as goddesses of the dawn, he prefers to identify with the moon. In

(31) The four daughters of Dubhthach were Liamhain, Ferchartain, Mianach, and Truistiu, married to the four sons of Aicher and Luachair, named Fomu, Roimper, Fernocht, and Ferdubh. I think we have here the four seasons represented, and we may, perhaps, explain the sixteen mounds of Mullach Maisten, mentioned by Lewis (Narraghmore), as having reference to the four seasons of the year. Dubhthach is stated to have slain his four daughters and four sons-in-law. Fomu and Liamain refer to the sring season, and Narraghmore, the name of the parish in which is Mullaghmast, is An Fharrach Mhoro, "the great place-of-assembly.' In Fomu, most likely fo is intensitive particle (for in names of his brothers are intensitive particles), as I think it is in Fomor, or "Fomorian," which Professor Rhys explains "under the sea," and Keating, "along the sea." The Irish regarded the Fomor as a giant, and the name appears to be a personification of "the great sea,," but in the tales the Formorians are connected with destructive fire and darkness, and hence the second battle of Moytura fought on November Eve, the first battle of Moytura having been fought on Midsummer day.

(32) Naas is named Nas na Righ and Nas Laighean (the Naasteighan probably of Lewis under Narraghmore, the letter T being misprint for L). Connellan says that the word nas signifies an assembly, a fair, and funeral games, and he quotes from "Dinnshenchas" three different derivations of Naas. Eochaidh Garbh collected the people to clear a plain from wood, that a nas fair or assembly might be held there in honour of his wife Tailltiu, daughter of Magh Mor, or "great plain," King of Spain, and nurse of Lug Long-hand. Nas was a servant of Tailltiu, and for an offence was ordered by Tailltiu to be slain, but Tailltiu's husband advised her to order Nas to construct a rath which would be more profitable, as in the tale of Emain Macha, and the rath was named Nas. According to the third explanation Nas was wife of Lug Long-hand, son of Scalbalbh, and daughter of Rudhraighe, King of Britain; and when Nas died she was buried at the place named Nas, or Naas from her, and on the first of August the people called together by Lug "keened" her, and hence the funeral ceremonies held on first of August were called Nasadh Logha, "the fairs or funeral ceremonies of Lugh," and hence Lughnasa, or Lugnasadh, the Irish name for August. See also explanation of La Lughnasadh in "O'Reilly's Dictionary," and the explanation in "Hibbert Lectures," by Professor Rhys.

"Silva Gadelica," p. 519, we are informed that Bodomar (Badamar), daughter of Lugar the fisherman, was wife to Finn; that she was slain by Currach Life, son of Cahirmore, and that Currach Life was slain by Finn. It appears to me that Fuinche, wife of Cahirmore, was a moon goddess, and in the tale of Lough Neagh, the importance of which cannot be exaggerated, and I do not forget Dr. Atkinson's description of the Irish tales, Fuinche is said to the another name for Liban, daughter of Eochaidh Find, and guardian of the sacred well from which the waters burst forth, and became Lough Neagh. We are told in the myth that Liban, who in "Silva Gadelica," p. 184, is made daughter of Eochaid, son of Eoghan, son of Ailill, had shape of a salmon in the Irish seas for three hundred years, and that she was followed by her lap-dog in shape of an otter. Liban is also mentioned in "O'Curry's Manners and Customs" as wife of Labraidh, brother of Fann, wife of Manannan mac Lir. Liban is supposed by the old writer who has preserved the tale of Lough Neagh, to mean white (ban), beauty (li), but the word, it seems to me, comes from li "water," which became lib, and the liban. In the myth Liban came to be identified with moon, for in the Irish tales the salmon is a moon symbol, and the otter, in the case of the otter of Liban, which had previously been a lap-dog, when Liban was a woman, sister of Airiu the earth, and wife of Curnan the sun, is a symbol of the sun. The tale of Lough Neagh is given in the "Kilkenny Journal," by O'Beirne Crowe; in the "Edinburgh Dinnshenchas," by Stokes; and in "Silva Gadelica," by O'Grady. Joyce in "Irish Names," says that the eruption of Lough Neagh is mentioned in an ancient poem published by Todd (Irish Nennius), from "Book of Leinster," and Dr. Joyce says that Linnmhuine, or "lake of the shrubbery," (but better explained by Crowe as "Stagnum Mictus," which appears to be symbolical of the destructive rain ascribed in the tale to the great horse of Oengus the sun god), was an old name of Lough Neagh. Dr. Joyce has also given the legend in his "Old Celtic Romances." Professor Hull ("Geology of Ireland"), proves that Lough Neagh is one of the oldest lakes in Europe, and consequently when we are told that Lough Neagh was formed in the end of the first century, we cannot accept the chronological setting given to the tale by the Irish bards, but at the same time we must not reject the valuable material which came floating down the stream of time to the bards, and we must try to explain the tale by comparing it with other tales. As Guaire, the father of Ebhliu, and Ebhliu, wife of Eochaidh Find, are connected by the old people of Ara, with prehistoric monuments of the district, it has been necessary for me to refer to this old tale connected with Lough Neagh, or lake of Eochaidh. Dubhthach Dael Uladh, that is Dubhthach the Chafer of Ulad, is also connected with the eruption of Lough Neagh, for O'Donovan ("Cath Muighe Rath," p. 208), says, "It is stated in 'Book of Lecan' that the lands which were his (Dubhthach's) patrimonial inheritance were soon after his death inundated (33) by Lough Neagh." In "Mesca Ulad," p. 37, we have the following description of Dubhthach, and also of the Luin of Celtchair, to which I have already referred. "Here before them to the east, outside," said Crom Deroil, "I saw a prodigious royal band. One man in front of it, with coarse black hair; an expression of gentleness in one of his eyes; foam of crimson blood in the other eye; i.e., at one time a gentle friendly aspect; at another time a fierce expression. An open-mouthed otter on each of his shoulders. A smooth white-surfaced shield upon him. A white-hilted sword with him. When its spear-ardour seized it, he would deal a blow of the handle of the mighty spear upon his hand, when the full measure of a sack of fiery particles would burst over its side and edge, when its spear-ardour seized it. A blood-black cauldron of horrid, noxious liquid before him, composed through sorcery of the blood of dogs, and cats, and Druids. And the head of the spear was plunged in that poisonous liquid when its spear-ardour came."

"By our conscience, the description is venomous," said Medb.

"Venomous is he whose description it is," said Curui.

"Who, then, is he?" asked Ailill.

"That is Dubhthach, the Chafer of Ulad," said Curui, "a man who never merited thanks from any; and when a prey falls to the Ultonians all, a prey falls to him alone. The quick, deedful luin of Celtchair is in his hand, on loan, and a cauldron of crimson blood is before it, for it would burn its handle, or the man that is bearing it, unless it was bathed in the cauldron of noxious blood. And foretelling battle it is."

(To be Continued.)

(33) In "Battle of Magh Rath," p. 208, Dubhthach is termed Dubhthach o'n Lind, and in "Aided Echach maic Maireda," p. 104, we have

Mare matan, matan Mairt,
Ni fuar ethar, ni fuar bairc:
Is and dolluid, ba sceln gle—
Lind Muni dar Liath-muine.

Alas a morn, a morn of Tuesday,
I found not boat, I found not barque,
It is on it went, it was a clear story
Lind muine over Liath-muine.

THE DIRGE ON DARGO.

(Translated from Smith's Gaelic Poems and versified.)

By John Anster, LL.D.

Like the oak of the vale was thy strength and thy height,
Thy foot like the erne (eagle) of the mountain in flight;
Thy arm was the tempest of Loda's fierce breath!
Thy blade, like the blue mist of Lego, was death!

Alas! how soon the thin, cold cloud
The hero's bloody limbs must shroud?
And who shall tell his sire the tale?
And who shall soothe his widow's wail?

I see thy father, full of days—
For thy return behold him gaze.
The hand that rests upon the spear
Trembles in feebleness and fear;
He shudders, and his grey, bald brow
He gazes till his dim eyes fail
With gazing on the fancied sail—
Anxious he looks—what sudden streak
Flits, like a sunbeam, o'er his cheek?

Joy, joy, my child it is the bark
That bounds on yonder billow dark?
His child looks forth with straining eye
And sees the light cloud passing by.

His grey head shakes—how sad, how weak
That sigh! how sorrowful that cheek?
His bride from her slumbers will waken and weep,
But when shall the hero arouse him from sleep?

The yell of the staghound—the clash of the spear,
May rise o'er his tomb—but the dead will not hear.
Once he wielded the sword, once he cheered to the hound—
But his pleasures are past, and his slumbers are sound.

Await not his coming, ye sons of the chase—
Day dawns; but it nerves not the dead for the race;
Await not his coming, ye sons of the spear—
The war-song ye sing—but the dead will not hear.

O, blessing be with him, who sleeps in the grave,
The leader of Lochlin, the young and the brave.
On earth didst thou scatter the strength of our foes—
Then blessing be thine in thy cloud of repose.

THE CHARIOT OF OLD.

A GRIM REMINDER OF THE COMBATS OF THE HEROIC PERIOD.

The chariot was used in antiquity for the battle, the chase, in public processions, and in games. It had two wheels and was drawn by two horses, and when one or two horses were added they were attached to each side of the main pair by a side trace, fastened to the front of the chariot.

These chariots have only come down to us in fragments, with the exception of the one in the archaeological museum of Florence, which is a unique example of a war chariot, the so called "Biga di Frassino," found by Rosselineo in a Thebes tomb. It is certainly as old at the fourteenth century B.C. It is probably a trophy obtained in the north by some Egyptian warrior.

There is an entire absence of metal in the construction. Immediately on the axle, without springs of any kind, rests the basket, or body, of the chariot, which consisted of a floor to stand on and a semicircular guard around the front and about half the height of the driver. It is entirely open at the back, so that the combatants might leap to the ground and up again, as became necessary by the exigencies of action. There was no seat, and generally in war chariots there was only room for the combatant and his charioteer to stand in.

The pole, as in the present instance, was usually attached to the middle of the axle, although to outward appearances it looked as though it sprang from the front of the basket. At the end of the pole was the yoke, which looked like a ram's horns. Depending from this by leather thangs was a Y shaped piece, which probably took the place of the modern horse collar. Probably broad bands were also fitted around the chest of the animals.

Besides the harness of each horse there were a bridle and a pair of reins somewhat in the same style as are in use at the present day. These were made of leather and were ornamented with studs of ivory and metal. The reins were passed through rings attached to the collar and were long enough to be tied around the waist of the charioteer in case of his having to defend himself.

The wheels and body were usually of wood, strengthened in places with bronze or iron. The wheels had from four to eight spokes, and the tyres were of bronze or iron (in the present instance ash was used), and the pins which secured the fellies were of fossil bone.

This description applied to the chariots of almost any of the nations of antiquity, the difference consisting chiefly in the mountings. Thus the chariots of the Egyptians and Assyrians, with whom the bow was the principal arm of attack, were richly mounted with quivers full of arrows, while those of the Greeks, who used the spear, were plain except as regards mere decorations. The Persians and the ancient Britons used a class of chariots having the wheels mounted with sharp, sickle-shaped blades, which cut to pieces whatever came in their way. This was probably the invention of the Persians.

The use of the battle chariot really belongs to the heroic period. The warrior, standing by the side of his charioteer, was driven in front of the line to invite hostile warriors to single combat. After the strategic skill of commander superseded the demands on his personal valour the chariot was transferred from the battlefield to the hippodrome, where alone its original form was preserved. The description of the Homeric battle chariot, therefore, to a great extent also applies to the historic chariot of the racecourse.

The small diameter of the chariot wheel may be explained from the desire of preventing the chariot from being opposed by the impediments in the battlefield, such as debris or dead bodies. The rim was usually formed of four fellies, into which the four spokes were let. The upper rail, which was of either wood or metal, varied greatly in form and was intended to be grasped by the warrior on jumping on to the chariot, while the front part served for fastening the reins and the traces of the "wheel horses." In the Roman triumphal chariot a covering of leather served to ward off missiles, and later on the sides were composed of strong boards.

Unfortunately we know very little of the vehicles of everyday use in those days. They nearly all seem to be a variety of what we now term the "gig."

THE DINGLE PROMONTORY AND ITS PEOPLE.

A CORNER OF IRELAND WORTH KNOWING.

By C. E. Edwards, in "Travel."

In these days it is almost exciting to come upon a beautiful part of Great Britain and Ireland which has not had its charms recognised by pictorial postcards. It may be assumed forthwith that such a district is not overrun by tourists, and, perhaps, that it has an indifferent train service, if any at all, and very poor accommodation for the stranger. With this preamble, I would like to introduce the Dingle promontory of Co. Kerry to more particular notice than it has yet received from the hands and eyes of people of leisure. Nor am I merely erratic in mentioning "hands" like this. The Dingle Irish are as hard up as the majority of their brethren in the Far West, and reasonably willing to improve their circumstances. Those of them who have time to think of such matters look with a certain envy at the neighbouring promontory of Waterville, with world-famed Killarney in its midst. And they ask themselves, again reasonably, why they are left so much in the cold. Saving its large lakes, what is there in Waterville that there is not in Dingle? The Dingle mountains are as bold and nearly as high as the Macgillicuddys Reeks, and the Dingle coastline is even more majestic than Waterville. The Dingle air is dryer than Killarney's. It has qualities of its own, too, which lift it to the rank of a health resort for consumptives. And where, pray, in all Ireland will you see more magnificent sandy bays than those of Smerwick Harbour and Castlegregory, with the Atlantic for ever rolling in upon them?

It is a detail, small if you will, yet precious, that in Dingle the people are hitherto quite unspoiled by casual contact with strangers, who are apt to startle first of all and then demoralise by the free distribution of spare cash. There may be a gentle patter of bare feet after you by Slea Head, and a brief murmur, "Give me a penny!" from one or two of the children of that wild little village of Coomeenoole, which has such a gorgeous outlook towards the Blaskets, but they make their appeal with no particular zest, rather as if it were a joke indeed, echoed from those exasperatingly persistent spots round Killarney over the matter. Offer them the penny, and they are as prone to run away laughing or frightened as to snatch at it. They certainly will not retort, "Give me another!" by way of "thanks," and they are quite likely to get their ears boxed by their outraged parents if these and their injured pride (a real thing) catch them in the act of mendicancy.

The stranger in Dingle is a personage to stare at, not bleed. And how these wild Irish of its Atlantic coast and valleys trending trout streams towards its sands do stare! Word seems to pass in the village about the approaching wonder. Then, with extraordinary quickness, men, women, and children mass about the low doorways to the thatched cottages, with tall grasses growing on the thatch and marked lack of chimneys. Not this only. The hamlets on that broad, fertile slope which falls from Brandon Hill towards Smerwick Harbour (a huge chessboard of green, yellow, and russet squares) are pervaded with white rocks as big as houses. The cows and calves and pigs, when not feeding, loaf amid these boulders and in the thick mire between them. And in times of excitement the children clamber on to the stones as a view-point, perhaps also with an eye to safety! Thus the whole village gets its share in the spectacle, and for a moment or two the bare brown legs and the red petticoats are all as still and stolid as the faces of the community. But the Celtic strain must show itself at length. Curiosity gets the better of what really seems worth terming the local awe in such a visitation. Having groped through the mire to a cottage door, whether to seek advice or a cup of tea, you are instantly surrounded by a chattering, clamorous, laughing, and hightly inquisitive crowd of children. And the grown women also let their tongues go. There is a Babel, indeed, with Erse predominating in it. And so it continues while you take your tea in the midst of the inquiring crowd, with the poultry scurrying about its bare legs, and other live stock looking in at the door over the shoulders of the children unlicensed to enter. Like as not, when you propose to pay for your entertainment, there is a heated scene. The lady of the cottage, with the most fluent English, breaks apparently into a temper. "Indeed," she cries, "there is nothing to pay at all, at all." But she and the others may of course be persuaded by a more or less tactful transference of the sixpence or shilling to one of the children of the house. Thus there is joy of a sort round the turf fire both in the stranger's going and coming.

The headland is accessible fairly enough by an odd little railway of the "light" kind, which meanders west from the famous market-town of Tralee—"famous" hereabouts, that is. Throughout Dingle, Tralee looms as large as a metropolis: its shops and churches are themes for eager talk. The cars of the railway are almost of the toy kind, designed as if to give travellers all possible enjoyment in the views of mountain and sea. They are not particularly well kept, and except on fair days are indifferently patronised. Dingle, indeed, contemplates its own little railway with somewhat mixed feelings. It would like to be grateful for it, but is not. The deficiencies that appear annually in its balance sheet have to be made up by a tax distributed over the headland. Still, of course, it serves its main purpose—to help on Dingle's civilisation and do something towards hurrying the lobsters and whiting of the local fisheries towards the eastern markets. "Something," yet by no means enough, judging from the tales of the fish merchants, to whom hours here are as important as minutes farther east. It is often a mere toss-up whether their goods arrive at their destination in a saleable or impossible condition. The railway indulges in no greater pace than twelve miles an hour, and runs only two trains daily in either direction.

The thirty miles of its course include a passage between the Slieve Mish mountains of East Dingle and the higher green and purple peaks of Middle and West Dingle. For an engine so small as those in use, it seems a moderate achievement to make the climb of nearly a thousand feet in a mile or two, as it does. The guide-books curiously hint at the danger of the line. This is not frantic. To be sure, the little train does rattle round the curves on the descents with what seems blind recklessness. But, so far, history tells of only one fatal accident, and that was years ago, when the engines were of another pattern to those now in use. The line was jumped and the engine hung over a bridge and dropped its driver fatally into the ravine. In the circumstances, it might have behaved even worse. No one in Dingle takes the chance of accidents into account. Nevertheless, when you are the sole passenger in the cars (an occurrence likely enough even in midsummer) there are times when it is impossible not to wish for rather more ballast to the tran. In such an adventure, too, you are forced to consider yourself a person of undue consequence. The guard takes a deep interest in you, and the constabulary at the stations study you as if you were at least a Fenian whose identity they would be prepared to swear to by and by in any police court.

Of Dingle town, at the other terminus of the line, there is nothing much to say. It has an enormous workhouse, in a fine situation, and probably more drinking saloons to its population of less than two thousand than any town in Ireland. These latter, however, minister to a floating crowd of fisher folk as well as residents. It is usual to see a score of fishing barques mirroring their hulls and spars in the silvery and placid pool of Dingle Harbour, and as it is not always fishing weather outside, the crews of the boats have but little resource on land save the taverns, which offer them "whiskey and entertainment"—anything rather than good whiskey too; a deplorable truth, which is explained professionally on the grounds that the seamen's throats do not appreciate a fluid unless it burns them. On the extreme north-west corner of the promontory there is another fishing station, Brandon quay. Here I was interested to learn that the local fishermen often drink mulled claret at two shillings a bottle instead of this coarse whiskey. They come into port of a morning so exhausted that their stomachs cannot endure the more familiar poison; it has to be mulled St. Julien then, or nothing. One marvels a litle how they can afford the luxury, seeing that fine mackerel here only fetch from sixpence to a shilling the dozen, whiting and plaice of size a penny each, and lobsters weighing three or four pounds less than eighteen pence a couple. The difficulties of suitable transport of course account for this excessive cheapness.

Dingle, with its sixty-seven publichouses, looks best from that formidable high road behind it, which in five miles climbs 1,300 feet above sea level. It makes that effort just to get as quickly as possible to the north side of the promontory. The sparseness of the villages here do not seem to justify such an expensive piece of engineering, and indeed the road is little used. But it is a gloriously picturesque thoroughfare, with the heather mountains of Gearhane West and the Middle Dingle cumber of lake-studded mountains close to the east. Its summit introduces one most impressively to the Brandon group, a very few miles to the north-west, with the brown and boggy Owenmore River between, winding from the half-dozen lakes which nestle in rocky holes and the flat of the upper valley itself. Brandon Peak is one of Ireland's noblest crests, with craggy precipices that make their plunges of a thousand feet and more for the enchantment of scarcely anyone except the natives. From Connor Hill Pass these precipices are completely fascinating, whether under clear skies or a cloud-pack. The road itself, in its rapid descent to Brandon Bay, has much thrill attached to it, especially for the cyclist. Slievanea Mountain to the right has been blasted to get a way under it; above and beneath the road the rocks stand little out of the perpendicular for hundreds of feet. But, as I have said, the road sees few tourists, and its menders do not trouble greatly about the grass which comparative disuse permits handsomely to grow upon it.

Better than Dingle town by much is the wild country between it and Brandon Head. It is not all wild. The Irish for centuries have toiled at the skirts and clopes of the mountains here, as nearly everywhere on the west coast. The twelve or fifteen square miles between Ballydavid Head, Brandon

Hill (3,127 feet high), and Kilmalkedar are an astonishing close company of —ue grey villages set among the cultivated patches. There is not a tree of size here, and nothing like a plantation. The Atlantic winds sweep the area north and west, and yet the crops of of hay, potatoes, and oats are very fair indeed. These, with the fishing in the canvas-covered coracles of the district, and the live stock of the farmyard kind, keep the thousands of men, women, and children here well above starvation. You will see no finer specimens of humanity anywhere than in —s remote corner of the British Isles. Though so laborously tilled, moreover, even this part of the country is not without beauty. Deep little lanes separate the hamlets and climb the slopes, with hedgerows and moist ditches, in which brambles, the osmunda fern, honeysuckle, foxglove, meadow-sweet, and many a smaller flower grow in a luxuriant tangle, which tells of the genial softness of the local air in spite of the Atlantic's vigour. As for the meadows, many of them dazzle the ye with the profusion of their ragwort; and down on the sands of Smerwick Harbour and Ferriter's Cove, farther west still, the blue sea-thistle may be added to the surrounding charms of heather and superb sea cliffs.

Right from these tokens of earnest toil, not unrewarded by commonplace contentment and domestic happiness (let he demagogues say what they please to the contrary), the mountains spring high. Brandon Hill's cairn is but three miles from Ballybrack village on the one side and Cloghane's church bell tower on the other side. The intervening six miles, however, yield mountain ridges to enchant a cragsman, and savage precipice-decked corries with dark tarns in them. Brandon Hill's great amphitheatre to the south-west deserves wide recognition. From the oratory of the saint on the summit the mountain falls away nearly sheer for fully a thousand feet, with a precise sweep to its walls north and south. The enclosed hollow of smooth rock-slopes at various angles glistens with lakelets all connected by a blithe little sparkling stream, which speeds their surplus waters down to the large and lower lakes of Nalacken and Cruttia. Brandon Peak's fierce crags and Brandon Hill's spurs guard these other recesses and give them a surprising air of gloomy magnificence. Cruttia, especially on a stormy day, would make its mark on any mind. It is a mile long, some seven hundred feet above sea-level in a heathery basin of the mountains, with Brandon Peak's most formidable precipice towering above it. A roaring and broad cascade connects it with Nalacken higher up, and in its turn it tumbles a series of other cascades down to the moist lands of the Owenmore valley.

But the fifteen miles of Dingle's western sea cliffs are in their way as fine as the curt little range of the Brandon mountains. Sybil Head, for instance, gives you a perpendicular wall some five hundred feet high to perch on and unforgettable views on all sides. This same massive headland develops towards the north into the savage little peaks known as the Three Sisters, sharp and precipitous, with the coffin-shaped grave of Saint Dinis to be passed in the tour of them. It is a saint-haunted district. Of Saint Brandon's life many touching particulars are told; and you are shown the rock in which the ministering cow milked itself repeatedly for his benefit, also his holy well, altar, and so forth, on his own mountain top. Saint Dinis is a less familiar personage. But it is known that he dug his own grave here and laid himself alive in it; and there the grave is to this day, an eerie enough thing to come across on this dangerous cliff edge in a storm, though with its edges suspiciously clean cut.

The mouth of Smerwick Harbour yawns a mile wide between the northerly Sister and Ballydavid Head, another splendid mass of cliffs more than eight hundred feet high, capped by an old signal tower. Through this mouth the Atlantic tide labours unrestingly. The Ballydavid fishermen are brave fellows. They think nothing of going out for a night in their frail black little canoes against the full force of the ocean swell, which threatens to overturn them at every wave. And for what? Sometimes a fair catch of mackerel or hake, which they may or may not be able to sell for a shilling or two; more often nowadays (for they say locally that the fish are leaving these shores) to be rewarded with just two or three sea bream, as many whiting, and perhaps a gurnard. It amounts to a relish for the sempiternal potatoes of their cottage dinner-table—little more. And of course it happens that in the quest a coracle now and then overturns. Little Ballydavid village was still mourning one such accident when I sojourned in it; and two families were still subsisting largely on the subscriptions that had been raised for them. The Atlantic generally keeps its victims on these occasions, though it was whispered to me that it need not have kept all these three poor fellows. One was seen off the cliffs a few weeks afterwards, "but," said my informant, "he was not in a fit state to handle—indeed he was not."

Sybil Hill and Ballydavid Head are samples of the audacity of Dingle's Atlantic coastline; north and south of them are other higher and perhaps finer cliffs. These want exploring, I might almost add surveying. At the moment, indeed, the Government engineers are hard at work with their instruments about Dingle's wild end. The existing maps seem to have scamped the district, not altogether without excuse, seeing how rough it is and how little interest the outside world takes in it.

With better accommodation to offer, Dingle ought, however, to get beyond this stage in its history. What there is here in the wilds is rough. In the picnic spirit, a glorious time might be enjoyed at the Ballydavid Post Office, which does, in fact, get two or three visitors per annum. Its rooms, with their many windows, seem designed to yield a series of lovely views. Perhaps they are a little overburdened with plants in pots. These thrive so heartily, however, in the sunshine and fine air that one would be loath to banish them, especially seeing that they are "watered" with tea, a charming local touch. Of the postmistress herself, it will do no harm to add that she is the good angel of the landscapes across which she scatters her letters. She would die rather than overcharge for a stamp or a week's board and lodging; and she would have worn herself down to the higgledy-piggledy churchyard of Kilmalkedar long ago with her labours by the deathbeds of others, if she were not gifted with a constitution which is but one witness among many to the salubrity of the district. So the local priest says; and who should know better than he?

There is no space to enumerate the antiquarian interests of Dingle over again

quarian interests of Dingle over and above the scenic and atmospheric. So much the better. They will come as a surprise to the visitor, who may be tempted hither by this paper, which is confessedly one of suggestion.

NEBRASKA BREATHING WELLS.

These remarkable phenomena are described in a recent publication of the United States Geological Survey. They are driven wells, which, after descending through from 50 to 100 feet of subsoil, penetrate a layer of dense limestone, about four inches thick, which rests upon the water-bearing gravel. Whenever an area of low barometer passes across the country the breathing wells sigh and roar with a noise audible, sometimes, at a distance of several rods. They blow outward for several days, and then the current is reversed and the air is drawn in, the changes always following fluctuations of the barometer. One explanation offered is that the porous gravel underneath the limestone layer contains air, whose pressure fluctuates in sympathy with that of the air above ground. But it is felt that a complete explanation remains to be made.

OUR WEEKLY STORY

MEI-AZUL.

A SCIENTIFIC ROMANCE.

By James Weir, M.D.

In these days of materialism when men imagine that they have discovered the source of life in certain natural laws worfing in successive cycles of evolutionary development towards a definite end, effects are mistaken for causes, and psychos, which is the soul of life, and its inception, is entirely overlooked by them or thrown aside as a relic of superstitious belief inherited from their savage ancestors. Yet here in this little inland town of Kentucky, there happened to me an adventure so strange, so wonderful, and so utterly different from the accepted order of things, that I feel that, like Moses, I have stood in the presence of the great First Cause, and that I have seen a soul come out of the Infinite and taken up its abode in the Finite.

That which I am about to relate came to pass twelve years ago, and, since there are only two men alive, as far as I know—and these two men are old, and nearing the grave—who can verify my tale in part, I think it best to make it public. These two men are Reuben Thruston, janitor of the bank buildings, and Tanner Anderson, sexton of Elmwood Cemetery.

Now, it all happened strictly as follows, for I am a sober, unimaginative man, and must, perforce, confine myself to the truth, lest I be caught tripping. I had passed my examinations, received my diploma, and had established myself in Daviess. Of patience I had an abundance, but of patients, alas! a woeful lack. My funds were almost exhausted, and I was casting about in my mind one day, while seated in my office, how and in what manner I could refill my purse, when I was startled by the sound, sharp and metallic, of something striking on the floor behind me. I turned in my chair, and saw an old-fashioned, steel-net purse, seemingly well filled with glittering money, lying on the floor beneath the open transom, through which it had evidently been thrown. I walked rapidly to the door, and opened it, and, peering forth, could see no one in the hall; I thereupon closed the door, and picked up the purse, marvelling greatly at its weight, for I had never before handled gold money, and knew not its heft. I am born of Quaker parents, good, sturdy, honest people (a fact which declares itself, so people say, in my manner of speech, although I affect it not, but speak naturally), who taught me that honesty was a paramount virtue, and that covetousness and miserly love of money were great sins, therefore was I minded to carry it down to the bank, and give it into the hands of good friend, Cashier Buckler. But while turning the purse in my hands, and wondering at the strangeness of its advent, I suddenly saw a slip of paper through its meshes, on which, when I looked with intent regard, I deciphered my name. I then abstracted the slip, and opening it, read the following:—

Selah.

"Dr. James Rumsey, Bank Building, Daviess, Kentucky—My Dear Sir: At one o'clock next Tuesday night, you will do me a great favour if you will kindly be present

at the corner of Seventh and Frederica streets, having with you such instruments, and such medicaments that (as your great learning will teach you) are necessary for the reanimation of one who has long been frozen. Accept this purse as a token, and a remembrance that a dozen others equally as valuable will make up your fee when you dismiss your patient.—Yours for Mei-Azul,

"AROUN MAHAL.

"P.S.—Take the carriage at the south-east corner."

When I had finished reading this note I sank back in my chair, overcome with a mastering amazement. What meant it, and who was Aroun Mahal, and what, or who was Mei-Azul? How could one be "long frozen" in midsummer, and, if dead, how could one be reanimated? My ruminations were brought to an end by the sudden entrance of Reuben Thruston, the negro janitor. Seizing the heavy purse, I emptied its contents on the table, and then cried: "Reuben, what is that?"

"Fo' Gawd, Marse Doctah, dat gole fur sut'n! What you git dem yallar boys? I ain't seed none lak 'em sense fo' de wah."

"This is a retaining fee, Reuben, but you must not mention it to any one, for I have no desire to have my business discussed by the tavern gossips."

"I won't say nothin', Marse Doctah, an' may you hab many mo' sich fees." Speaking thus, Reuben bowed himself out.

"So I am not dreaming," muttered I to myself. "Reuben said that it was gold, real 'yaller boys.' I wonder what it all means"

I returned the gold twenty dollar pieces one by one to the purse, and discovered that there were twenty-five of them; five hundred dollars for a retaining fee, with the promise of six thousand more when I dismissed my patient! This Aroun Mahal must be enormously wealthy, thought I. I picked up the note again, and glanced at it. High up in one corner I read the word "Selah," which before had escaped my observation. Then my eyes dropped to the word or words, "Mei-Azul," and straightway there seemed to be formed a connection between these words and myself. Now, dim, shadowy pictures of a far-away Eastern land; of palm trees; of camels, and goats, and sheep; of massive buildings, and hundreds, nay, thousands, of swarthy builders; of stern taskmasters and overseers; of a haughty and kingly man borne aloft on a litter, and surrounded by men in glittering armour, began to pass before my eyes; suddenly one picture ceased to be shadowy and dim, and became so bright, so vivid, so life-like, that I now believe that I then saw that which I had seen before—and this is what I saw and heard: On the shores of an inland sea, a mighty host lay encamped. Gathered in front of their tents were thousands of men, women, and children, who were gazing silently and intently on a little band of women, who were approaching from the desert—a shining, glittering waste of sand outstretched at their backs, until it blended with the gray concavity of the heavens on the horizon. A girl of twenty, of exquisite beauty, both of face and form, led this band of women. Suddenly, a remarkable looking man advanced in front of the people, and commenced a chant of praise to Jehovah, in which all the multitude joined. When they had finished their song, the beautiful girl and her band took up its burden.

"Sing ye to the Lord, for he has triumphed gloriously: the horse and his rider hath He thrown into the sea."

Then all the people shouted: "Mei-Azul! Mei-Azul! prophetess of Israel."

The scene vanished, and I found myself seated in my chair with the purse in my hand. A feeling of great awe seemed to fill my entire being, and a conviction came over me that I must meet this Aroun Mahal at all hazards.

On the following Tuesday I prepared myself for my visit, placing in my bag such medicines as I deemed suitable for the occasion; and, seeing that a powerful electric battery was in good order, I ordered Reuben Thurston to be at my rooms at midnight, so that I might have assistance in transporting bag and battery to the corner designated by Mahal in his letter. Promptly at half-past twelve o'clock we started, and just as the town clock was striking one we met a carriage at the south-east corner of Seventh and Frederica streets. The carriage door was thrown open, and I heard a voice saying: "This way, Doctor; be careful, the night is as dark as pitch."

I handed in bag and box, and then sprang in myself, and at once I felt myself seized in the powerful grasp of two men, one on each side, who deftly pinioned my arms and legs. I had barely time to utter one cry of astonishment ere a gag was thrust into my mouth, and I sank back on the seat, voiceless and powerless. I heard, rather than saw, Reuben, as he made a frantic rush to my assistance, only to be struck down by a blow from the butt of the driver's whip. Then we raced down the street, the carriage swaying from side to side, such was the rapidity of our speed.

"Sit still, Doctor, and no harm shall befall you; we treat you thus as a matter of precaution. We wish you to remain in ignorance of the direction in which we are travelling; therefore, I must blindfold you."

Blindfolded, gagged, and pinioned, a helpless prisoner, seemingly, in a carriage drawn by terror-stricken or maddened horses, my position was not a pleasant one. Yet, strange to say, I was not alarmed, nor did I feel outraged at my treatment: something within me kept whispering "all is well."

After what seemed to me hours of travel the carriage stopped, the door was opened, and I was requested to get out. My guards conducted me into a house, rapidly unloosened the bonds from off my arms and legs, removed the cloth from my eyes, and thrust me into a brilliantly lighted room, where some one—a man—was singing a weirdly beautiful song, to a magnificently rendered piano accompaniment, with one of the most melodious tenor voices I had ever heard. Blinded for the time being by the exceedingly great light in the room, I could only stand with my hands pressed to my eyes Meanwhile the voice rang on, and soon I recognised the words of the song: "Sing ye to the Lord," commanded the voice, "for He hath triumphed gloriously;" then triumphantly, "the horse and his rider hath He thrown into the sea."

The song came to an end, and then I heard the rich toned tenor voice exclaim: "Welcome, Dr. Rumsey! I am Aroun Mahal. You are somewhat blinded by the glare, I presume; you'll be all right, however, in a second. I must have light and music especially to-night, for God's curse is about to be removed from Israel; and I, Doctor, am an Israelite."

Raising my head, my eyes having by this time become inured to the light, I saw one of the most singularly handsome men that I ever met. He was about six feet tall, strongly yet lightly built, with a certain air of dignity that commanded instant respect. His features were regular and firmly modelled, while his perfect proportioned head sat firmly on a symmetrical, yet strong, and virile neck. His eyes, dark, fathomless, mysterious, seemed to emit a subdued though steady glow as they looked straight into mine—reading, as I felt, my inmost thoughts.

"I will not ask you," continued he, "not to discuss with your friends the occurrences of this night, for your good sense will teach you that absolute silence on your part will be an act of discretion. For you will see that which, if related by you to the world, will brand you either as a liar or a madman. Outside of certain religious beliefs, men will not accept that which they cannot understand; consequently, many a man has sunk beneath the contumely of the world's scorn for having dared to enunciate a simple truth. But come with me; I will conduct you to your patient."

Speaking thus, he led the way into a hall, through which we passed to a flight of steps leading down to a room, which, having entered, I took to be a cellar. This room was also brilliantly lighted. In its centre there stood a heavy wooden table, and on the table was an oblong box, shaped somewhat like a burial casket. Approaching this casket, Mahal leaned his arm upon it, and then asked me if I knew the wood of which it was made. I examined it carefully, but was forced to confess my ignorance; I had never seen wood like it before.

"It is," said he, "the famous shittim wood of the far East. Does it feel cold to your touch"

"No," replied I; "and, craving your pardon, I would fain remove my coat, for the atmosphere is unpleasantly close here in this cellar. By the way, it is getting late, therefore, lead me to my patient."

"She is here," said Mahal, gently tapping the casket with his fingers; "and do not remove your coat, but put on this heavy overcoat, and this fur cap; also draw on these heavy boots and gloves, for instead of this sultry summer heat, an arctic coldness will, in a few moments, invade this cellar. See! I am dressed, and ready to meet it." For, while speaking, he had been busily engaged in putting on the counterparts of the clothing which he had shown me.

Marvelling greatly, I hastened to do as he commanded. Seeing that I had prepared myself by putting on the heavy clothing (though I sweated grievously in the act), he busied himself about the casket, and in a few seconds removed the top. Immediately an intense cold permeated the cellar. The moisture in the atmosphere was congealed, and fell in feathery snow-flakes to the floor; my eyebrows and lashes seemed to curl and crinkle, while my face burned as with a winter's frost. Mahal rested the top against the wall, and again approached the casket. He touched some hidden mechanism, and at once the four sides fell outward and downward, like the leaves of a folding table, and there stood an immense slab of ice; in its centre, plainly revealed by the glare of the lights, was the nude body of a young woman—the girl who led the band of women in my vision, and whom the people called Mei-Azul.

Mahal fell prone upon his knees, and raising his hands towards heaven, exclaimed:

"Mei-Azul! Mei-Azul! Prophetess of Israel and Saviour of the Chosen People! For over three thousand years hast thou rested entombed in this shroud of ice, and now shalt thou go forth in all thy beauty to lead the people home. God of Abraham, Isaac, and Jacob, thy will be done. Selah!"

Then he arose, and turning towards me,

said: "Not one question will I answer now, Doctor; wait until later on, then I will tell you all that I am permitted to tell. Now to work."

He took from his overcoat pocket a small package, which he opened; then, stepping up to the slab of ice, he took from the package a pinch of white powder, which he sprinkled on its surface. Instantly the ice began to deliquesce, to melt, and to dissolve into water. Torrents poured from the slab, and fell upon the floor; the air rapidly became warmer, and in ten minutes time the ice had disappeared, and there remained only the lovely and inanimate form of the girl. Wrapping a sheet about the body, Mahal took it in his arms; then, turning, he said: "Follow me upstairs, into another room; your work begins now."

He led the way upstairs, and into a room in which there was a bed, on which he placed the body of the girl. The physician was aroused in me now, and I resolved to bring her back to life if such a thing were possible. Seizing my battery, which, as well as my medicine case, I found in the room, I applied one pole to the neck over the pneumogastric nerve, and the other pole over the heart; then, after directing Mahal to hold them in place, I commenced artificial respiration. After five or six minutes of careful manipulation, a thrill shot through me as I saw her beautiful bosom expand. Then I heard a rush of air through her windpipe, and a great awe fell upon me, and I felt, for a moment, that I stood in the presence of God! In a few moments natural respiration was established; I thereupon gave in one arm a hypodermatic injection of one one-hundredth of a grain of nitro-glycerine, and in the other an injection of a drachm and a half of whiskey. She remained cold and clammy, however, which alarmed me greatly, and I called for blankets and hot-water bottles. Mahal smiled mysteriously as he answered my request with a shake of his head.

"She is a cold-blooded animal now, Doctor, and all the hot bottles in the world will not elevate her natural temperature a fractional part of a degree. Come, your work is done—and well done, too; we will now leave her with the women whom I will call."

He pulled a bell cord, and then lead me into the room into which I had been thrust when I first arrived at the house.

"Here, Doctor," said Mahal, presenting a cigarette case, "are some of the Sultan's own brand, and I think you will find them very fine. Now take that easy chair, and I will endeavour to explain the seeming mystery of to-night's occurrences. I assure you that you have not seen anything supernatural. Your scientists call it Natural Law, but we orthodox Israelites call it God's Law; we believe in God, and we believe in His word. We furthermore believe that God is the Creator of Nature, and that He instituted the laws which govern Nature, at the inception of the universe. Some of us know a little about lore of the Egyptians, who were further advanced in some things than we ourselves, notwithstanding our vaunted civilisation. Again, Moses was in direct communication with God in the spirit, who revealed to him all His will. Now, God does not institute new laws, nor does He break those that have been in existence since the creation. For a purpose of His own, Jehovah decreed that Mei-Azul (or Miriam, as she is called by the Talmudic writers) should not die at the end of her natural term of life, but that she should live for over three thousand years. [illegible] how to preserve her body, together with her soul, without corruption, until the time should come for her reanimation; and he performed this seeming miracle without violating a single law of nature.

"Ice is nature's best weapon in warding off the process of decay, but the warm-blooded animal is invariably killed when frozen through and through; while, on the contrary, many cold-blooded animals can be frozen until they are brittle, and then be brought back to life. Thus, Pouchet and Horvarth have shown that many of the fresh water worms and infusoria can be frozen, and kept for months in a frozen condition, without endangering life. Indeed, Horvarth has shown that at least one warm-blooded animal, the zizel (spermophilus citillus) becomes a cold-blooded animal at times; for, during its winter sleep, when the thermometer registered two degrees above zero, this naturalist discovered that the temperature of a hibernating zizel was the same as that of the surrounding atmosphere. Again, many animals, when subjected to changed surroundings, become modified as to their vital economy, and take on new forms—aye, even develop new organs. For instance, Von Willimoes-Suhm found nemerteans, aquatic animals, living beneath stones, on perfectly dry ground, and Semper discovered aquatic crabs in countless numbers in Minorca, living on dry land. These animals, which in their natural habitat derive their oxygen from the water through the agency of their gills, owing to their changed surroundings, acquired lungs, and have become true air-breathers. By the gradual addition of salt to fresh water, Karl Semper changed certain fresh water crustaceans into salt water individuals; he then brought these individuals back to their original forms by the gradual addition of fresh water. The interval between the cold-blooded reptiles and the warm-blooded birds is by no means great; all naturalists recognise this fact, and agree in saying that the one was the parent form of the other, and that the modification was due solely to changed surroundings.

"Moses simply subjected Mei-Azul to changed surroundings, and in this manner brought about a modification of her vital economy—from a warm-blooded animal she became a cold-blooded animal. The rest was easy; he froze her in the slab of ice, as you have seen, and gave her into the family of Mahal. The father transmitted her to the son, generation after generation, and so she has come down through the long years, until the time came for her reanimation."

"But the ice?" questioned I. "How did Moses manage to freeze her, and keep her frozen?"

"Look," answered Mahal, stepping to a table, and pouring out a glass of water. "Look," said he.

He took from his vest pocket a tiny vial, from which he dropped a single minim of clear, sparkling fluid; the water instantly froze into a solid lump, shattering the glass into a thousand pieces, while an ice-cold wave swept through the room, chilling me to the marrow.

"Ammonia machines and like contrivances for the artificial production of great cold were, probably, unknown to Moses, yet Jehovah taught him to manufacture a substance which, when added to water, produced a degree of coldness far transcending anything ever dreamed of at the present time. Professor Dewar, an English scientist, has been experimenting along these lines, and has succeeded in producing a very low degree of temperature, indeed, but he has not yet obtained the true Mosaic formula. I could uncork this little bottle, throw it into the Ohio River, and freeze it solid from its source to its mouth; aye! even if it were filled with boiling water from bank to bank. The first Mahal, when he received the casket also received a scroll, in which the guardians of the box were directed to unscrew a little cap in its lid every century, and drop in on the ice two drops of the fluid. I should also add that the box is lined on its inner surface with a substance that will transmit neither cold nor heat. In this scroll the year and day, aye! even the very hour, fixed for the reanimation of Mei-Azul is duly set down. She is the leader appointed by the God of Abraham, Isaac, and Jacob to conduct his chosen people back to Jerusalem. You will see her again—there. I will restore her to her normal condition, a warm-blooded animal; how I will do this I am not at liberty to tell. But, Doctor, the night is growing old, and dawn approaches; drink this glass of Hebron wine, and sleep for an hour before you are driven home. I will sing you to sleep."

I drank the wine, and fell asleep, and dreaming that I was listening to an angelic choir. When I awoke it was broad daylight, and Anderson Turner, the sexton of Elmwood Cemetery, was shaking my arm, and demanding if I were sick, and how it happened that he had found me asleep among the graves.

"What is that pinned to your coat" demanded he. I looked down, and saw a paper pinned to the lapel. It was a certified cheque for six thousand dollars on the Chemical National Bank of New York. Aroun Mahal had redeemed his promise.

STANZAS.

("Our better mind
Is as a Sunday garment, then put on
When we have nought to do; but at our work
We wear a worse for thrift.")

'Tis past—a burning noon of warmth and light!
The softened splendours of departing day
On the lone summit of the distant height
A moment linger in their onward way.

Haste, ere they flee—and bid the scene, the hour,
With the soft touch of harmony, restore
From the deep slumber of past years, the power
Of feeling and of song, to life once more.

Peace in the gathering shadow steals abroad.
Instinct with inspiration won from her,
The breezes travel their mysterious road,
And fluttering leaves and rippling waters stir.

The freshest odours rise from herb and flower:
The softest sunlight tinges every steep:
Joy carols wildly from each brake and bower,
And the waves murmur in their tranquil sleep.

All—all, that thrills the senses, or the mind,
Nature herself hath at this moment wove
Into one spell of harmony, to bind
The heart in chains of sympathy and love.

Nor wholly of this world those glorious beams;
Nor mortal voices only charm the ear:
From brighter skies escape some transient gleams,
Some tones of seraph minstrelsy we hear.

Oh, scene of beauty! hour of peace! not all
Of paradise, as yet from earth is driven:
Our Maker's image still survives the fall,
Still hues of evening faintly image heaven.

Mr Jeremiah Curtin, the translator of Sienkiewicz, Giovatski, and other novelists of Northern Europe, is credited with a knowledge of 60 languages. Cardinal Mezzofanti, who died in 1849, was looked upon as a marvel, though he spoke only 38 languages. Probably, however, Mr Curtin cannot speak every tongue he knows. In any case he is an exceptional linguist.

NOTES AND QUERIES.

A MUNSTER LAKE LEGEND.

In Lecky, the historian's latest work, "The Map of Life," 1901, appears the following legend: "In a certain lake in Munster, it is said there were two islands; into the first death could never enter, but age and sickness and the weariness of life, and the paroxysm of fearful suffering were all known there, and they did their work till the inhabitants, tired of their immortality, learned to look upon the opposite island as upon a haven of repose. They launched their barques upon its gloomy waters; they touched its shore, and they were at rest." Could any reader say to what Munster lake this strange legend was attached?

MUNSTER MAN.

A REAL OLD IRISH GENTLEMAN.

In a note to Vol. I. of Hardiman's "Irish Minstrelsy," p. 175, reference is made to The O'Leary, who long lived, and lately died (i.e., previous to 1837), at Millstreet, in the county Cork, who "took a pride in being one of the last of his countrymen representing old families who maintained the ancient, hospitable way of living." From Townsend's "Survey of the Co. Cork," we learn further in regard to this old Irish gentleman, that "he was known only by the name of O'Leary. He lived in a small house, the lower part consisting of little more than a parlour and kitchen, the former of which supplied with every article of good cheer, was open to every guest and at every season, and this profusion was accompanied with perfect cleanliness and decorum. His cellar, well stocked with good liquors, never knew the protection of a lock and key; for, as he stated himself, nobody had any occasion to steal what anyone might have for asking. It derived security, however, from other causes—from deference to his sway and respect for his person, both of which were universally felt and acknowledged within the circle of his influence. He was also a justice of the peace for the county. The appearance of O'Leary was always sufficient to maintain order in fairs and meetings, and to suppress any spirit of disturbance without the aid of soldier or constable. He possessed, indeed, some admirable requisites for a maintainer of the peace; for he was a very athletic man, and always carried a long pole, of which the unruly knew him to be no churl. To these good qualities O'Leary added an inexhaustible fund of original humour and good-natured cheerfulness; and, being very fond of the bottle himself, it was impossible to be long in his company sad or sober."

Evoc.

THE OLD SAILING DAYS.

(From the "Hull Advertiser," 2nd January, 1796.)

A letter from Captain Thomas Heseltine, of the "Lynx" transport, dated Cove of Cork, December 21, 1795, and received at this place the 29th ult., gives the following intelligence: "I am happy to acquaint you of our safe arrival in the Cove yesterday with the ship 'Lnyx,' having on the 12th instant sprung a leak; the next morning cut away part of the ceiling aft in order to come at it, but notwithstanding all our endeavours to stop it the ship continued to make so much water, that on the 18th bore down to Admiral Christian, when I went on board and informed him of our situation; he ordered me to proceed for this port, giving me despatches to the Admiralty, to be forwarded from here. The Admiral's ship, 'The Glory,' had at one time about 200 tons of water on her middle deck; the 'Alfred,' of 74 guns; and 'Le Tusco,' of 40, dismasted; a frigate, name unknown, foundering: and about 30 sail of transports missing; left the fleet on the 18th at two p.m. in lat. 48-57 N. long. 11.30 W., consisting of about 150 sail; hope to get repaired in time to save the convoy from this place."

DANIEL O'CONNELL.

A CHARACTER PORTRAIT OF SIXTY YEARS AGO.

In the "Portrait Gallery" of the "Dublin University Magazine" in March, 1841, the picture of Daniel O'Connell which we this week reproduce appeared. The artist in his spirited drawing does not seem to "have set down aught in malice—he appears to have aimed rather at giving a faithful portrait of the Liberator in a characteristic every-day pose. The portrait was accompanied by a character sketch, regarding the absolute fairness of which (though the notice is not meant to be unkindly on the whole) there would be divergence of opinion; so we content ourselves with giving its opening sentences:—

Daniel O'Connell in our Portrait Gallery!! And—observe him—how thoroughly unconscious he appears of the distinction. There is not the slightest intimation in his countenance of gratitude or even surprise. The Venetian Doge, who amidst all the wonders of the French court, wondered most to find himself there, has not left to the Doge of Ireland any portion of his sensitiveness. Such is the character of the land we live in. An Irishman, like a Parisian, is everywhere at home. Mr. O'Connell takes it all as his due; and if any trick of youth remains with him, very probably imagines that for the beauty of his countenance we have selected him to ornament our gallery.

He is mistaken if he thinks so. The reader will not mistake. Not that we deny the man to be "a noticeable man" enough—but he is not of that shape and feature which wins its way solely by the power of its external charms. He looks as if he had been successful—but as if success had lost all its poetry. Things have gone well with him, you would say, as you look upon his visage; but he no longer feels the charm of being prosperous. He lives in a disenchanted world. So his whole air and deportment indicates. But it indicates also that he is satisfied to take it as it is, and to be contented with it.

But why have we chosen him? Is it for his political opinions—or for the high qualities by which he adorns them? or for the sound moral by which, however we may deprecate his objects and ends, he compels us to confess that what "he would highly, that would he holily?" No such thing—in all these particulars we have oftentimes condemned him. Why, then, hang up his portrait? There is a passage written by one Shakespeare which we do not wish to quote, but in plain prose we profess that we have been influenced by the station he has acquired, the power he wields, the aims he has in view, and feel that, although we do not give him our praise or our good-will, we cannot refuse to him our notice. Let him hang, then (portrait wise), in our gallery.

As we believe that in connection with this portrait interest would be felt by by most readers in a character pen sketch made twenty years before the portrait was drawn, we reproduce from Colburn's 'New Monthly Magazine," 1823, the following:—

If any one of you, my English readers, being a stranger in Dublin, should chance, as you return upon a winter's morning from one of the "small and early" parties of that raking metropolis, that is to say, between the hours of five and six o'clock, to pass along the south side of Merrion square, you will not fail to observe that among those splendid mansions, there is one evidently tenanted by a person whose habits differ materially from those of his fashionable neighbours. The half-opened parlour-shutter, and the light within, announces that someone dwells there whose time is too precious to permit him to regulate his rising with the sun's. Should your curiosity tempt you to ascend the steps, and, under cover of the dark, to reconnoitre the interior, you will see a tall, able-bodied man standing at a desk, and immersed in solitary occupation. Upon the wall in front of him there hangs a crucifix. From this, and from the calm attitude of the person within, and from a certain monastic rotundity about his neck and shoulders, your first impression will be, that he must be some pious dignitary of the Church of Rome absorbed in his matin devotions. But this conjecture will be rejected almost as soon as formed. No sooner can the eye take in the other furniture of the apartment, the book-cases clogged with tomes in plain calf-skin binding, the blue-covered octavos that lie about on the tables and the floor, the reams of manuscript in oblong folds and begirt with crimson tape, than it becomes evident that the party meditating amidst such objects must be thinking far more of the law than the prophets. He is, unequivocally, a barrister, but apparently of that homely, chamber-keeping, plodding cast, who labour hard to make up by assiduity what they want in wit—who are up and stirring before the bird of the morning has sounded the retreat to the wandering spectre—and are already brain-deep in the dizzying vortex of mortgages and cross-remainders, and mergers and remitters; while his clients, still lapped in sweet oblivion of the law's delay, are fondly dreaming that their cause is peremptorily set down for a final hearing. Having come to this conclusion, you push on for home, blessing your stars on the way that you are not a lawyer, and sincerely compassionating the sedentary drudge whom you have just detected in the performance of his cheerless toil. But should you happen in the course of the same day to stroll down to the Four Courts, you will be not a little surprised to find the object of your pity miraculously transferred from the severe recluse of the morning into one of the most bustling, important, and joyous personages in that busy scene. There you will be sure to see him, his countenance braced up and glistening with health and spirits—with a huge, plethoric bag, which his robust arms can scarcely sustain, clasped with paternal fondness to his breast—and environed by a living palisade of clients and attorneys, with outstretched necks, and mouths and ears agape, to catch up any chance-opinion that may be coaxed out of him in a colloquial way, or listening to what the client relishes still better, for in no event can they be slided into a bill of costs, the counsellor's bursts of jovial and familiar humour, or, when he touches on a sadder strain, his prophetic assurances that the hour of

(From the Dublin University Magazine, 1841).

Ireland's redemption is at hand. You perceive at once that you have lighted upon a great popular advocate, and if you take the trouble to follow his movements for a couple of hours through the several courts you will not fail to discover the qualities that have made him so—his legal competency—his business-like habits—his sanguine temperament, which renders him not merely the advocate but the partisan of his client—his acuteness—his fluency of thought and language—his unconquerable good humour—and, above all, his versatility. By the hour of three, when the judges usually rise, you will have seen him go through a quantity of business, the preparation for, and performance of which, would be sufficient to wear down an ordinary constitution, and you naturally suppose that the remaining portion of the day must of necessity be devoted to recreation or repose; but here again you will be mistaken; for should you feel disposed, as you return from the courts, to drop in to any of the public meetings that are almost daily held for some purpose, or to no purpose, in Dublin, to a certainty you will find the counsellor there before you, the presiding spirit of the scene, riding in the whirlwind, and directing the storm of popular debate, with a strength of lungs, and redundancy of animation, as if he had that moment started fresh for the labours of the day. There he remains, until by dent of strength and dexterity, he has carried every point; and from thence, if you would see him to the close of the day's "eventful history," you will, in all likelihood, have to follow him to a public dinner, from which, after having acted a conspicuous part in the turbulent festivity of the evening, and thrown off half a dozen speeches in praise of Ireland, he retires at a late hour to repair the wear and tear of the day by a short interval of repose, and is sure to be found before dawn-break next morning at his solitary post, recommencing the routine of his restless existence. Now, any one who has once seen, in the preceding situations, the able-bodied, able-minded, acting, talking, multifarious person I have been just describing, has no occasion to inquire his name—he may be assured that he is, and can be no other than "Kerry's pride and Munster's glory," the far-famed and indefatigable Daniel O'Connell.

Mr. O'Connell was born about eight and forty years ago, in that part of the united kingdoms of Ireland and Kerry, called Kerry. He is said to be descended in a mathematically and morally straight line from the ancient kings of Ivera.* The discrowned, family, however, have something better than the saddening boast of regal descent to prop their pride. His present ex-majesty of Ivera, Mr. Daniel O'Connell's uncle, has a territorial revenue of four or five thousand a year to support the dignity of his traditional throne; while the numerous princes of the blood, dispersed through the dominions of their fathers, in the characters of tenants in fee-simple, opulent leaseholders, or sturdy mortgagees in possession, form a compact and powerful squirearchy, before whose influence the proud "descendants of the stranger" are often made to bow their necks, in the angry collisions of county politics. The subject of the present notice is understood to be the heir-apparent to his uncle's possessions. These he must soon enjoy, for his royal kinsman has passed his 90th year. In the meantime he rules in his own person an extensive tract among the Kerry hills—of little value, it is said, in point of revenue, but dear to the possessor, as the residence of the idol of his heart, and in truth almost the only tenant on three-fourths of the estate—

"The mountain-nymph, sweet Liberty."

Mr. O'Connell was originally intended for the Church, or, more strictly speaking, for the Chapel. He was sent, according to the necessities of the time, to be educated at St. Omer—for in those days the wise Government of Ireland would not allow the land of Protestant ascendency to be contaminated by a public school of Catholic theology. Dr. Duigenan was compelled to permit the detested doctrines to be freely preached; but to make the professors of them good subjects, he shrewdly insisted that they should still, as of old, be forced to cross the seas, and lay in a preliminary stock of Irish loyalty at a foreign University. But the dread of indigenous theology was not peculiar to that great man. I observe that some of our statesmen of the present year have discovered that all the disasters of Ireland have been caused by an invisible establishment of Jesuits, and must continue until the omnipotence of Parliament shall expel the intruders—a felicitous insight into cause and effect, resembling that of the orthodox crew of a British packet, who, having discovered, during a gale of wind, that a Methodist preacher was among the passengers, at once made up their minds that the fury of the tempest

*One of the kingdoms of the county of Kerry.

would never abate until the vessel should be exorcised by heaving the Nonconformist overboard. I have not heard what occasioned Mr. O'Connell to change his destination. He probably had the good sense to feel that he had too much flesh and blood for a cloister; and the novelty of a legal career to a Catholic (for the Bar had just been opened to his persuasion) must have had its attractions. He accordingly left St. Omer with its casuistry and fasting and vesper hymns, to less earthly temperaments; and having swallowed the regular number of legs of mutton at the Middle Temple, was duly admitted to the Irish Bar in Easter Term, 1798. The event has justified his choice. With all the impediments of his religion and politics, his progress was rapid. He is now, and has been for many years, as high in his profession as it is possible for a Catholic to ascend.

Mr. O'Connell, if not the ablest, is certainly the most singular man at the Irish Bar. He is singular, not merely in the vigour of his faculties, but in their extreme variety and apparent inconsistency; and the same may be said of his character. The elements of both are so many and diverse that it would seem as if half a dozen varieties of the human species, and these not always on the best terms with each other, had been capriciously huddled together into a single frame to make up his strange and complex identity; and hence it is that, though I spoke of him heretofore as a favourable subject for a sketch, I find the task of accurate delineation to be far less easy than I anticipated. I have the man before me, and willing enough, it would appear, that his features should be commemorated; but, like the poor artist that had to deal with the frisky philosopher of Ferney, with all my efforts I cannot keep him steady to any single posture or expression. I see him distinctly at one moment a hard-headed working lawyer, the next a glowing politician, the next an awful theologian; his features now sunk into the deepest shade of patriotic anguish, now illuminated, no one can tell why, as for the celebration of a national triumph. A little while back I caught him in his character of a sturdy reformer, proclaiming the Constitution, and denouncing the vices of courts and kings, and he promised me that he would keep to that; but before I had time to look about me, there he was, off to the Levee! be-bagged and be-sworded like any oppressor of them all, playing off his loyal looks and anti-Radical bows, as if he was to be one of Mr. Blake's next baronets, or as if he had not sufficiently proved his attachment to the throne by presenting his Majesty with a crown of Irish laurel on the beach of Dunleary. Such a compound can be described only by enumerating its several ingredients; and even here I am not sure that my performance, if rigidly criticised, may not turn out, like my subject, to be occasionally at variance with itself. I shall begin with (what in other eminent lawyers is subordinate) his individual and extra-professional peculiarities; for in O'Connell these are paramount, and act a leading part in every scene, whether legal or otherwise, of his complicated avocations.

His frame is tall, expanded, and muscular; precisely such as befits a man of the people—for the physical classes ever look with double confidence and affection upon a leader who represents in his own person the qualities upon which they rely. In his face he has been equally fortunate—it is extremely comely. The features are at once soft and manly; the florid glow of health and a sanguine temperament is diffused over the whole countenance, which is national in the outline, and beaming with national emotion. The expression is open and confiding, and inviting confidence; there is not a trace of malignity or wile—if there were, the bright and sweet blue eyes, the most kindly and honest-looking that can be conceived, would repel the imputation. These popular gifts of nature O'Connell has not neglected to set off by his external carriage and deportment—or perhaps I should say that the same hand which has moulded the exterior has supersaturated the inner man with a fund of restless propensity, which it is quite beyond his power, as it is certainly beside his inclination, to control. A large portion of this is necessarily expended upon his legal avocations; but the labours of the most laborious of professions cannot tame him into repose; after deducting the daily drains of the study and the Courts, there remains an ample residuum of animal spirits and ardour for occupation, which go to form a distinct, and, I might say, a predominant character—the political chieftain. The existence of this overweening vivacity is conspicuous in O'Connell's manners and movements, and being a popular, and more particularly a national quality, greatly recommends him to the Irish people—"Mobilitate viget"—Body and soul are in a state of permanent insurrection. See him in the streets, and you perceive at once that he is a man who has sworn that his country's wrongs shall be avenged. A Dublin jury (if judiciously selected) would find his very gait and gestures to be high treason by construction, so explicitly do they enforce the national sentiment of "Ireland her own, or the world in a blaze." As he marches to court he shoulders his umbrella as if it were a pike. He flings out one factious foot before the other, as if he had already burst his bonds, and was kicking the Protestant ascendancy before him; while ever and anon a democratic, broad-shouldered roll of the upper man is manifestly an indignant effort to shuffle off "the oppression of seven hundred years." This intensely national sensibility is the prevailing peculiarity in O'Connell's character; for it is not only when abroad and in the popular gaze that Irish affairs seem to press upon his heart; the same Erin-go-bragh feeling follows him into the most technical details of his forensic occupations. Give him the most dry and abstract position of law to support—the most remote that imagination can conceive from the violation of the Articles of Limerick, or the Rape of the Irish Parliament, and ten to one but he will contrive to interweave a patriotic episode upon those examples of British domination. The people are never absent from his thoughts. He tosses up a bill of exceptions to a judge's charge in the name of Ireland, and pockets a special retainer with the air of a man that dotes upon his country. There is, perhaps, some share of exaggeration in all this; but much less, I do believe, than is generally suspected, and I apprehend that he would scarcely pass for a patriot without it; for, in fact, he has been so successful, and looks so contented, and his elastic, unbroken spirits are so disposed to bound and frisk for every joy—in a word, he has naturally so bad a face for grievance, that his political sincerity might appear equivocal, were there not some clouds of patriotic grief or indignation to temper the sunshine that is for ever bursting through them.

(To be Concluded Next Week.)

A MYSTERY OF THE TREES.

One of the most puzzling questions in botany is, "Why, or how does water rise to the top of a tree?" Various explanations of the phenomenon have been proposed, but none is regarded as altogether satisfactory. Dr. E. B. Copeland recently attacked the problem by means of interesting and novel experiments. For instance, he constructed an "artificial tree" of plaster of Paris, and found that water moved upward in it more than 40 feet high. Yet he was unable to base any definite conclusion upon the results that he obtained. The water travels a large part of the way in a film, between bubbles on one side and the wall of the conducting vessel on the other. But the physical properties of the film are yet unknown.

THE OAKS AT GLENEIGH.

BY ROBERT DWYER JOYCE.

Oh! think of the days when the crags' hoary masses
Bent o'er our green forest in Houra's wild passes,
When the grey wolf was king of the forest and mountain,
And the red deer ran free by the blue torrent's shore,
When the prey scarcely rested at eve by the fountain,
Swept on by the spear of the wild creachadore!

'Twas a brave time, a wild time—the hills seem to mourn
Till the splendour of glade and of forest return;
Yet is not their splendour as wild and as shaggy,
Where the huge blasted roots of that forest remain,
Wide spread o'er each deep cave and precipice craggy,
Sending scions of strength to the blue sky again?

Afar where Molanna* in thunder is flowing,
Afar in Gleneigh are these strong scions growing—
They spring from the stream, and they tower from the ledges
Of the huge rocks which frown o'er that wild fairy dell:
Like young guardian giants encircling the edges
Of the deep silent pool, and the moss-wreathed well.

How thick in the Summer their green leaves were shining!
How sere and how scattered at Autumn's declining!
But the wild hills shall see them far greener than ever,
When Winter hath fled from the bright looks of May.
Ah! thus should Adversity's children endeavour
To breast the rude blasts, like the oaks of Gleneigh!

* The Houra Mountains, a range lying along the northern borders of Cork, between it and Limerick. In a valley, at the northern declivity of these mountains, rises the main stream of the Aubeg, or mulla of Spenser; the other branch rises in the bog of Annagh, to the west. Smith in his "History of the County Cork," says that the Brackbawn, or principal branch of the Funcheon, a river rising far away in the Gaulties, is the Molanna mentioned in the "Fairie Queene." Here are a few of Spenser's lines:—

"Amongst the which there was a nymph that hight
Molanna, daughter of old Father Mole,
And sister unto Mulla faire and bright."

And, in another stanza, Spenser says that Diana and her nymphs punished Molanna, for leading Faunus to their bathing-place, by "whelming her with stones"; but Faunus, to reward her

"For her paine
Of her beloved Fauchin did obtaine
That her he would receive unto his bed:
So now her waves passe through a pleasant plaine,
'Till with the Fauchin she herself doe wed,
And, both combined, themselves in one fair river spread."

This is at Teompal Molaga, an ancient church near Kildorrery, where the Oun-na-Geeragh—River of the Champion—falls into the Funcheon. A beautiful mountain peak, now St. Feine, or the seat of the Finian warriors, but called by Spenser "Old Father Mole," rises near the springs of the Mulla; and in its western gorge the Oun-na-Geeragh has its source. This river is the Molanna, and not the brackbawn, as Smith has stated. The Brackbawn rises at least eighteen miles from the source of the Mulla, and Spenser, who knew topography round Kilcoleman very well, could not have called a river rising at such a distance

"Sister unto Mulla faire and bright."

The Oun-na-Geeragh is nearly as large as the Funcheon where they meet; and its course, and the scenery around it, correspond most accurately with the descriptions of the Molanna, given in Spenser's poems.

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

By CHARLES SMITH, M.D.

Æquum est enim meminisse & me, qui discerem hominem esse, et vos, qui Judicetis ut si probabilia dicentur nihil ultra requiratis. Cicero Univers

In Two Volumes.

VOL. I.

The Second Edition, with Additions.

BOOK II.

Containing the Topographical Description of this County, including the City of Cork.

Chapter I.—Continued.

In returning to Macroomp, the Mushery mountains and Boggra lie to the east. On the S.W. foot of Mushery there are three flat stones set up edgeways; the middle one is nine feet high and three broad; there are also several circles of them, with single pillar stones, standing at a small distance, being works of the Danes or ancient Irish.

Two miles S.W. of Macroomp there is a stone bridge over the river Toon, near which, on the W. side of the Lee, there was discovered, a few years ago (on the estate of Dr. Edward Barry, of Dublin), a vein of metallic substance in a limestone rock. An assay was made of it, and it proved to hold some lead ore.

Between this and Inshigeelagh stand the castles of Drumcaragh, Carrigneneelagh, and Carrignacurragh; in this last Cromwell placed a garrison. The O'Leary's were the ancient proprietors of these castles and all the adjacent country, which is called from them Ivelary. Carignacurragh was forfeited by Conoher O'Leary, for joining in the rebellion of 1641. It is a lofty pile, being above 100 feet high, standing on the W. bank of the river Lee. This river has its course here, and for a considerable way below, interrupted with islands and a deep, boggy tract, until it runs to the bridge of Ballynaclassen. These islands are covered, mostly, with oak, ash, hazel, and birch, at the feet of which grow fern, pollypodium, and water dropworth. Here are great quantities of several kinds of water-fowl, in their seasons as bitterns, cranes, duck and mallard, teal, &c. These bogs have been attempted to be drained, but it was found impracticable. In one, called Anaghaly, is about three acres of ground, on which is excellent limestone, that supplies the town of Macroomp, the western inhabitants of this barony, and Carbery, with lime for manure and building.

Inshigeelagh, six miles S.W. of Macroomp, has a good barrack for one foot company, built in a stone fort of four bastions, erected on the N. end of a bridge over the Lee. Near this place, many pieces of a metallic substance have been found in the form of cubes, as hard as iron, and glittering with sparks, intermixed, of a pale yellow, shining like gold. These cubes are washed out of the rocks on the banks of the river by winter floods. See more of them, Book IV., Chap. VIII.

Many of these mountains have been formerly tilled; for when the heath that covers them is pulled up and burned, the ridges and furrows of the plough are visible. About a hundred years ago this country was all a forest. The woods consisted of large oak, birch, alder, some ash, and many yews of as great a bulk as the largest oak. Great quantities of fir are still taken out of the turf bogs. This forest was then stored with red and fallow deer; and abounded with great ayries of excellent hawks, which, with the timber, belonged to the Earl of Cork.

A small mile W. of Inshigeelagh, the river Lee opens into a fine lake, called Lough Allua, three English miles long, and half a mile broad, stretching out into several bays; it is deep, and not fordable from end to end. Salmon trouts, almost as large as salmon, small river trout of various kinds, and eels abound in it; also the charr or Alpine trout. The river here is of a still, slow motion, till emptying itself at Inshigeelagh, it is contracted, and runs with a rapid and violent course. On the south side of this lake are a range of lofty rocks, in some places covered with yew and birch; and on the north side is a green plain, extending the length of the lake.

The upper end is replenished with several mountain rills; the chief is a rapid little brook, descending from another lake, called Gougane-Barra. Before one arrives at this last, both man and horse must perform penance for two miles over the rudest highway that was ever passed. A well-spirited beast trembles at every step; some parts of the road lie shelving from one side to the other, which often trips up an horse; other places are pointed rocks, standing like so many sugar-loaves, from one to three feet high, between which a horse must take time to place and fix his feet. It was with great difficulty that I passed two miles of this causeway in two hours. Gougane-Barra signifies the hermitage of St. Finbar, he having (as tradition says) lived here a recluse before he founded the Cathedral of Cork. This retreat is esteemed one of the greatest curiosities in these parts; it lies in the remotest solitude imaginable, and is, in reality, a most elegant and romantic spot, its very aspect and situation betraying a place seemingly designed by nature for a recluse. It lies in the bowels of vast high mountains, making so many enclosures round it. St. Finbar's hermitage is a small island, surrounded by a fine, deep, and capacious lake of about 200 acres, almost circular. This lake is environed by a stupendous amphitheatre of lofty hills, composed of perpendicular bleached rocks, in some places, boldly hanging over the basin. In some crevices of the rocks grow yews and evergreens. In fair weather there are several rills that gently glide down with a murmuring noise into the lake; but on heavy rains the whole prospect seems a perfect chaos, the water then, from the top of the mountain, tumbling down all around, in several cataracts, with a roaring noise like thunder, which makes a most awful and majestic scene. On the top of these precipices, eagles, hawks, and other birds of prey breed and live in great security. This place, since the time of St. Finbar, has been frequented by many devotees as a place of pilgrimage; and to get to it is little less than to perform one. In the island are the ruins of a chapel, with some small cells, a sacristy, chamber, kitchen, and other conveniences, erected by a late recluse (Father O'Mahony), who lived an hermit in this dreary spot 28 years. When one is in this island, the chasm in the mountain, by which the lake is entered, is not seen, occasioned by the jutting out of part of the hill; so that if a person was carried into it blindfold,, it would seem almost impossible, without the wings of an eagle, to get out, the mountains making, as it were, a wall of rocks some hundred yards high. Round part of the lake is a pleasant green bank, with a narrow causeway from it to the island. That part of the island unbuilt upon, Father Mahony converted into a garden, planted several fruit trees in it with his own hands, and made it a luxurious spot for an hermit. Opposite to this island, on the continent, is his tomb, placed in a low little house, on which is this inscription:

"Hoc sibi et successoribus suis in eadem vocatione, monumentum imposuit dominus doctor Dyonisius O Mahony, presbyter licet indignus. An. dom. 1700.'

He was not buried in it till the year 1728.

This solitude would, at first sight, naturally dispose a man to be serious; for as Milton says:

——— Musing meditation most affects
The pensive secrecy of desart cell,
Far from the cheerful haunt of man and herds,
And sits as safe as in a senate house;
For who woul'd rob an hermit of his weeds,
His few books, or his beads, or maple dish,
Or do his grey hairs any violence?
Masque of Comus.

The head of the river Lee, being the Luvius of Ptolomy, rises in this romantic spot.

The description given us, by Sir John Denham, of the source of the Thames, exactly agrees with the rise of this river.

But his proud head the airy mountain hides
Among the clouds, his shoulders and his sides
A shady mantle clothes, his curled brows
Frown on the gentle stream, which calmly flows.
Low at his feet, a spacious plain is placed,
Betweeu the mountain and the stream embraced,
Which shade and shelter from the hill derives,
While the kind river wealth and beauty gives.

This scene had some bold Greek or British Bard,
Beheld of old what stories had been heard
Of fairies, satyrs, and the nymphs their dames,
Their feasts, their revels and their am'rous flames.
'Tis still the same, although their airy shape,
All but a quick poetic sight of escape.
Cooper's Hill.

Gougane lake affords a very good trout, of a broader and flatter kind than other trouts. The mountains produce a long, coarse grass, called, by the country people, fenane, here wholly employed in grazing young stock and dry cattle from May to November. The riches of these mountains are not on the surface; probably a diligent search into their bowels might discover some very valuable minerals. At Gougane Barra lived one Mr. Murphy, who had been an officer in Queen Anne's service; was a very intelligent person, well skilled in the ancient Irish manners and customs, and read and wrote the language extremely well. From Iveleary, proceeding eastwards to Cork, there are several good seats and improvements in this barony. It is computed that since the Earl of Clancarty's forfeiture, more than 200 good slate houses have been built in it; also seven new churches and several stone bridges. I shall mention these seats as they lie in my way from Macroomp to Cork.

Kilbarry, three miles S. by W. from Macroomp, is an handsome house of Robert Warren, Esq.; the door, window frames, and belting are of hewn stone. Here are good orchards, gardens, and a deer park. This land is in the parish of Maclony, though in the midst of Kilmurry parish. In which last stands the ruins of Clodagh castle, said to have been built by the Mac-Swineys, who were anciently famous for Irish hospitality. On the W. side of the high road, near Dunusky, there was a stone set up, with an Irish inscription, signifying to all passengers to repair to the house of Mr. Edmund Mac-Swiney for entertainment. This stone still lies in a ditch, and the Irish say that the person of this family who overthrew it never throve after. In a sand hill, called Knocan-ni-croich, in this parish, several shells are found resembling those on the sea coast. From Clodagh, to the confluence of the river Bride with the Lee (above six miles), there is a fine valley, bounded by hills to the N. and S. which afford several limestone quarries. In the midst of this valley is the bog of Kilcrea, called, in Irish, Geary, formerly very incommodious and unprofitable, the middle of it being woody, bushy, and very deep, quite inaccessible, and edged on the E. and W. with red bogs, and till about 30 years ago frequented by wolves, to the great annoyance of the adjacent inhabitants. This description of it was returned by an inquest of jurors, on a commission of survey, ann. 1656; and so it continued in the same condition till about the year 1705. It was the domain estate of the Earl of Clancarty; and when he set the adjacent lands by lease, he always inserted a clause of reservation of the whole bog to himself, whenever he should go about to drain it, giving them, in the meantime, liberty of pasturage, plowboot, &c. But it might have remained long undrained if the last earl had not forfeited it. When the trustees sold the adjacent lands, parcels of the bog were sold with them, having natural bounds of rivulets, &c. to distinguish them. It was a very bold attempt to begin to drain it by any private gentleman; yet John Bailey, Esq., of Castlemore, having the west end of it, consisting of about 200 acres, in the summer of 1705 first began the work, which was continued by Mr. Sweet and Mr. French, with great labour and assiduity, till they completed the design. Forrest, 4 miles E. by W. of Macroomp, in the parish of Canaboy, is a pleasant seat of William Spread, Esq., where is an handsome house, good gardens, large orchards, fish ponds, and a great number of trees planted. In the same parish is Shandangan, a mile S.W. of the former, a pretty seat of Christopher Farbury, Esq.; the gardens lie to the W. of the house, and are formed out of a drained bog, which is now cut into pleasant ponds; here are good orchards, and a deer park.

At Mahallagh, five miles from Macroomp, is a pleasant seat of Mr. Nettle's, on the south bank of the Lee.

Strawhall, formerly Kilbrenin, was an abbey of regular canons, founded by St. Ædus in the 8th century, according to Archbishop Usher (25) and Colgan; it is not mentioned by Sir James Ware (26); a part of the ruins are still remaining on a rising ground.

The parish of Aglish lies on both sides the river Lee; the south part of it is in the diocese of Cork, and the north in that of Cloyne. Aglish is on the south side of the river, where there is a good house and plantation of Mr. Hingston. In the rebellion of 1641, Tiege Mac-Cormac Mac-Carty forfeited this estate.

Castlemore, in the parish of Moviddy, was formerly built by the Mac-Swineys, but afterwards belonged to the Mac-Cattys; for Phelim Mac-Owen Mac-Carty was the forfeiting person in the rebellion of 1641. It is in repair, and inhabited by Mr. Travers. It formerly belonged to John Bailey, Esq., and is now the estate of Mr. Rye, whose father, Col. Rye, married the daughter and heiress of Mr. Bailey. Half a mile east is Ryecourt, an handsome house and improvement of the late ingenious Col. George Rye, aforementioned, and now inhabited by his son. Besides good gardens and orchards, Col. Rye raised and planted many thousands of oaks, and other forest trees, within a few years, and was a great improver in several branches of agriculture. In the gardens are some arbutus trees, which bear fruit. A mile west of Ryecourt is Inshirahill, alias Crook's-town, an old improvement, good gardens, and large orchards of cider fruit, with a good house, and all convenient out-offices. To the westward of the house are fine groves of fir. This place was never recovered by the Earl of Clancarty since the rebellion of 1641. It is now the estate of Mr. Crook. The soil in this neighbourhood is a light grey earth, with a limestone bottom, producing fertile crops to the industrious farmer. The church of Moviddy was lately rebuilt. In the churchyard is an handsome monument, to the memory of the late Captain Bailey, of Castlemore.

About a quarter of a mile N. of the church is a quarry of excellent white freestone; and on the W., near Kilmurry, is a well dedicated to the Virgin Mary, and much frequented on her festivals by the common Irish; near it is a stone, in which they pretend is the miraculous impression of a man's knee. On the W. side of the road from Crook's-town to Bandon is a large monument, of a great length and breadth. Tradition says it was erected to the memory of one Nial, who was said to be slain in battle near this place.

Rath is a seat built by Alderman James French, of Cork, with a paddock and other improvements.

(To be Continued.)

26. This Saint Ædus was born in Meath, and from this monastery was made Bishop of Meath. He died on the 10th of November, 789. His life (which I have seen), begins thus, "Sanctus episcopus Aidus filius Brichii de nepotibus Neil oriundus suit, &c. This place is called by old writers, Enachmid Brenin, or Brevin. At a place anciently called Cluain Finglass (not now known) was an abbey of regular canons, founded by St Abban, in the 7th century, in this barony of Muskery.

25. Antiq Brit. p. 448, 449.

THE OLDEST BEAUTY SHOP.

Recipes for perfumes and beauty balms four hundred years old are the treasured possessions of the Convent of Santa Maria Novella, in Florence. The perfumery of Santa Maria Novella was first made in 1503 by the Dominican Brotherhood, who, like all the monks of the Middle Ages, were learned in botany and knew all the medicinal virtues of every plant in nature. Their recipes soon became celebrated throughout the world, as did also their fame, and the perfumery of Santa Maria Novella of Florence was acknowledged to be the first and greatest ever known. The Medicis patronised it and endowed it with donations from time to time.

Every new director has added some new recipe to the original ones, and his portrait hangs on the walls of the establishment. For instance, Brother Marchissi gave the recipe of the famous antisterical water in 1612; while Brother Cavalieri gave the recipe for the celebrated quina elixir, the finest tonic in the world, in 1659. Then, in 1684, Fra Angiolo Paladini, who made a special study of the skin, invented an almond paste, a lily water, and a cosmetic vinegar, which were soon adopted by the ladies of the Tuscan court. In 1707 Fra Ludovico Berlingacci invented his celebrated "long life elixir"; and in 1743 Fra Cosimo Bucelli brought out his equally celebrated alkermes, and so on till 1825.

The last monk director of this old establishment was Fra Damiano Beni, and he was the first to exhibit in foreign exhibitions, gaining medals wherever he went. He died in 1869, and was succeeded by his nephew, who soon gave an extraordinary development to the business.

Pope Innocent XI. once gave a recipe to cure burns, which is still called "Balsam Innocenziano." Reading over the catalogue of this old perfumery, we come across such things as rhubarb elixir, melissa water, and Regina water (invented by a Medici queen), and all made from herbs cultivated in the convent grounds. There is also a water to cure toothache, which every dentist should possess, it is so safe and quick in its effects.

Some of the convent's waters are used instead of soap to cleanse, soften, and whiten the skin. Even the health and beauty of the hair were studied by these good old monks, who were doctors, chemists, and perfumers combined, and whose study was the cultivation and perfection of human health and beauty. The orris powder of Santa Maria Novella is considered the finest in the world. It is made from the plant growing in the gardens and is ground in the convent laboratory. It is used to perfume linen, to brush on the teeth, and to apply to the skin after the bath.

Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

DULEEK, a parish and village, formerly a Parliamentary borough, partly in the barony of Upper, but chiefly in that of Lower Duleek, county of Meath, and province of Leinster, 4½ miles (S.S.W.) from Drogheda, on the Nannywater, and on the mail coach road from Dublin to Belfast; containing 4,470 inhabitants, of which number 1,217 are in the village. This place derived its name, signifying a "House of Stone," from the foundation of a church here by St. Kiernan or Ciernan; who was baptised by St. Patrick in 450 and died in 488. St. Patrick is also said to have founded an abbey at this place, over which he appointed St. Kiernan abbot; the establishment was for several ages the seat of a small surrounding diocese, which ultimately merged into that of Meath. Its situation in a maritime district exposed it to the ravages of the Danes, by whom it was frequently plundered and sometimes destroyed. It was plundered in 1171 by Milo de Cogan and his forces, who on the following day were attacked and repulsed with severe loss by the Ostmen of Dublin. A priory for Canons Regular appears to have been founded here by one of the family of O'Kelly, a long time prior to the English invasion; and in 1182, a cell of the same order was established here by Hugh de Lacy, and made subject to the priory of Llanthony; the possessions of this priory were granted at the dissolution to Sir General Moore, ancestor of the Drogheda family. After the battle of the Boyne, Jas. II. retreated from Donore at the head of Sarsfield's regiment, and was followed by his whole army, which poured through the pass of Duleek pursued by a party of English dragoons. On reaching the open ground, they drew up in order of battle, and after cannonading their pursuers, effected their retreat in good order. The town was formerly governed by a portreeve and officers, annually elected under the charter of Walter de Lacy, which was confirmed by act of Edw. IV., in 1481, and by royal charter of Jas. II., in 1686. From this latter period it continued to send members to the Irish Parliament till the Union, when it was disfranchised, and the corporation became extinct: the sum of £15,000, awarded as compensation for the loss of the elective privilege, was paid to the trustees of H. Bruen, Esq. Petty sessions are held every alternate week. There are considerable remains of the ancient abbey church, with a massive square tower surmounted at the angles with embattled turrets; it was very extensive, and contains many ancient tombs, among which is one of a bishop. There are also some remains of the priory of St. Mary, on the Marquess of Thomond's demesne, and also anciently an endowed hospital, of which there are no remains. In the centre of the town and near Annsbrook are two handsome carved stone crosses bearing inscriptions, erected by the De Bathe family; and at Whitecross is another, elaborately carved. Sir William D'Arcy, treasurer of Ireland in 1523, and author of a work on the Decay of Ireland and the causes of it, was born at Platten.

ARIZONA'S PREHISTORIC RACES.

THE SOUTH-WESTERN TERRITORY ONCE TEEMED WITH A DENSE POPULATION.

The recent discovery in Central Arizona of an irrigation canal of large proportions, which was used before Columbus, has aroused a new spirit for archæological investigation in the South-West. The remains of enormous and wonderfully made irrigation canals, constructed by a race of whom there are now no known descendants, are abundant in the region of Phœnix and Mesa, in Maricopa County, but this discovery of a canal that was evidently fed by the Rio Verde (in what is now Yavapai County), and which was so large that logs and small barges could be easily floated along it, is the most interesting piece of prehistoric work found in Arizona in years.

All who have investigated the fascinating subject agree that there were once several cities of perhaps 100,000 population in Central Arizona, and that buildings, each constructed of a peculiar concrete of abode soil and gravel, covering two acres in area, and reaching eighty and more feet in height, were not uncommon for sun-worship in Southern Arizona. Los Muertos (a recently named city, but probably more than 1,000 years old), in Pima County, must have had some 200,000 population. The remains of its city walls, reaching miles up hill and down dale, and the immense quantities of burned bone dust, probably the remains of aboriginal cremation ceremonies, betoken this. The vicinity of the Gila and Salt Rivers was the scene of the densest population, as the abundance of prehistoric implements and weapons, and ruined walls show.

But the artificial waterways of these ancient and mysterious peoples are the most interesting remains found in this territory. Army engineers say they are marvels of engineering skill. The largest and best preserved waterway is 32 miles north of Phœnix. The water was supplied from the Verde River. For nearly four miles this waterway passes through an artificial gorge in the Superstition Mountains, cut out of the solid rock to a depth of one hundred feet. After the mountains are passed it divides into four branches, the longest of which measures more than 40 miles, while all four aggregate a length of 120 miles, independent of the smaller ditches by which water was distributed over the soil. Except in rare instances these smaller ditches have been filled, and in that part of the desert are obscured by the sandstorms that prevail; but the larger one is distinct, and measures 64 feet in width, with an average depth of 12 feet. Through this way the water for the support of the cities between the Salt and Gila Rivers was conveyed, and 1,600 square miles of country, now almost destitute of vegetation, was irrigated by it.

This canal reached to within a short distance of the Gila River, and the water was taken from the Salt River, for the apparent reason that at this point the north bank of the Gila was so high that the builders were unable to reach the current with a canal, and they evidently knew of no way to raise the water to the level of the surrounding country. This part of the desert is covered with ruins, and must have been at one time the residence of a teeming population. Immediately south of this region several large canals were taken out of the Gila, and they extend quite a distance into the valley, one of them supplying the city which contained the Casa Grande—the largest, best preserved, and most noted prehistoric ruin in the United States.

On the other side of the Salt River there are more waterways, though they are not of such length. Here, also, was the principal city, 28 miles in length, by 12 in breadth. It contained many large buildings, which are now little more than shapeless mounds of stone and mortar. All the wooden parts of these structures have been destroyed by the ravages of time, and even the joists, where they were protected by the stone and mortar, have decayed, leaving only the vacancies they once filled. Near Phœnix, in one of the ruins, which are evidently those of some public building, the walls and roof appear to have been crushed together with great force, forming a huge pile of debris, yet standing to a height of 20 feet. The wooden beams in the structure, some of them 18 inches in diameter, were bent, broken, and thrown across each other in great profusion. In this position the broken stone and mortar settled around them, and in the course of time the mass hardened again, so that when the wooden timbers finally decayed, they left holes the size of the timbers. When the fact is considered that rain seldom falls here, and that cold and dew are conditions entirely unknown in the valleys, it is apparent that ages must have elapsed while this process of decay was going on.

There are undoubtedly two eras of inhabitation, that of the cliff-dwellers being the more recent of the two, and perhaps as long after the valley races had become extinct as our age is after them. As yet no theory has been advanced by which we can so much as approximate the age of the cliff-dwellers. Their builders were rude, and more unsettled than the inhabitants of the valleys, and they lived by war and the chase, as is proved by the weapons found about their abodes. On the contrary, the people of the valley lived peaceful lives, built magnificent temples, to a certain extent encouraged the fine arts, and tilled the soil with a system of irrigation equal to that of the most prosperous days of ancient Egypt.

Recent surveys prove that at one time not less than 3,000,000 acres of land were capable of irrigation from the canals then in existence, while now we have only 337,000. The population must have been enormous. The extent of their civilisation is not so much enveloped in mystery as is their origin, or the cause of their total destruction. Hundreds of implements used by the artisan and farmer have been unearthed, and the vessels used for culinary purposes are symmetrically and tastefully fashioned. Many of them were painted in a manner evincing a considerable knowledge of art, and the figures, though they have for ages been subjected to the chemical effects of the alkali in the soil, are still as bright and perfect as the day they were drawn. Shell bracelets were found on the arms of skeletons, and other jewels of turquoise and bone show skill and fine workmanship. The houses were constructed on a plan adapted to ease and comfort, and the capacious hallways with their stone floors and cement walls were peculiarly fitted for this half-torrid climate. Their knowledge of engineering was so perfect that our centuries of practice and discovery have not enabled us to improve upon the grade or location of their canals. No metallic substances are found in any of the ruins, and the people evidently knew nothing of their use. That they had a language written by hieroglyphics is unquestionable, and for miles at a stretch throughout Arizona the faces of the cliffs are covered with mysterious characters. Slates found in the ruined dwellings and temples are engraved with the images of animals, persons, and these emblematical figures, though so far no attempt has been made to decipher their meaning.

THE LOVE OF READING.

"But while the tastes which require physical strength decline or pass with age, that for reading steadily grows. It is illimitable in the vistas of pleasure it opens. It is one of the most easily satisfied, one of the cheapest, one of the least dependent on age, seasons, and the varying conditions of life. It cheers the invalid through years of weakness and confinement, illuminates the dreary hours of the sleepless night, stores the mind with pleasant thoughts, banishes ennui, fills up the unoccupied interstices and enforced leisures of an active life, makes men for a time, at least, forget their anxieties and sorrows, and, if it is judiciously managed, it is one of the most powerful means of training character and disciplining and elevating thought. It is eminently a pleasure which is not only good in itself, but enhances many others. By extending the range of our knowledge, by enlarging our powers of sympathy and appreciation, it adds incalculably to the pleasures of society, to the pleasures of travel, to the pleasures of art, to the interest we take in the vast variety of events which form the great world drama around us. To acquire this taste in early youth is one of the best fruits of education, and it is especially useful, when the taste for reading becomes a taste for knowledge, and when it is accompanied by some specialisation and concentration, and by some exercise of the powers of observation. 'Many tastes and one hobby' is no bad ideal to be aimed at. The boy who learns to collect and classify fossils, or flowers, or insects, who has acquired a love for chemical experiments, who has begun to form a taste for some particular kind or department of knowledge has laid the foundation of much happiness in life."—Lecky's "The Map of Life."

LITERARY NOTES.

Lord Aberdeen, President of the New Spalding Club, is to contribute a volume to the series of Gordon monographs, dealing with the branch of the family which he represents, and edited by the Rev. James Brebner, M.A., Forgue.

✧ ✧ ✧

Mrs. Flora Annie Steel has joined the staff of the "Saturday Review," and will contribute a weekly signed article dealing especially with social matters. The present issue of the "Saturday" contains the opening article in a "Survey of the Higher Schools of England." This series based on special information, will be an attempt to estimate the forces of secondary education and their right development in this country.

✧ ✧ ✧

Messrs. Longman are to publish a book by Miss Alice Wood on the interesting question, "Should boys and girls be educated together" The inquiry irresistibly recalls Dean Ramsay's amusing story of the Scotch boy who was asked where he was in his class. Having replied that he was second from the top, he was next asked how many were in the class. "Only me and anither lass," was the delightful but ungrammatical answer.

✧ ✧ ✧

C. K. S., of the "Sphere," is fond of recording the rarer books that he is enabled to add to his collection of Johnsonian and Omarian rarities. The latest is an American fac-simile of the hitherto undiscovered first edition of Dr. Johnson's Prologue, spoken at the opening of the theatre in Drury Lane in 1747. Three of its lines are well known:—

The drama's laws the drama's patrons give,
For we that live to please must please to live;

a proposition, which, if true, intensifies the tribute to Shakespeare:—

And panting Time toil'd after him in vain.

✧ ✧ ✧

The three lean years of publishing which we had up to 1902 seem to have given place to a fatter regime. According to the trustworthy statistics of the "Publishers' Circular," the output of the past year exceeded that of 1901 by no fewer than 1,337 books. In poetry and drama the increase is seventy; in history and biography about fifty; in arts, sciences, and illustrated books more than a hundred. The grand total was 7,381 works, great and small.

✧ ✧ ✧

A comedy by Mr. John Davidson, a composition in a lighter vein than anything that has come from his pen for some time, will be published by Mr. Grant Richards in a few days. In a prefatory note Mr. Davidson says: "This play was written in 1900, and after various adventures is now published—twenty-five years having come and gone since, in 'An Unhistorical Pastoral,' I first wrote of the Maypole." The comedy is entitled, "The Knight of the Maypole," and is in four acts, "in prose and in verse," as the British Museum catalogue phrases it.

✧ ✧ ✧

The "Bookman" says:—"Judging from the reports which reach us from New York, the boom in American fiction is over and the inevitable reaction has set in. Booksellers complain that they are glutted with novels, and doubtless there will soon be an end to the scramble among the publishers for what, we believe, they call historical romances. The change in the situation may be due to over-production or to the development of taste among American readers, but in either case it should be beneficial in the long run. Here the reaction against the tyranny of the novel began some time ago."

✧ ✧ ✧

Saturday last was the centenary of the birth of Douglas Jerrold. The once famous Mrs. Caudle has recently been revived, and one or two other works of his have been included in one or other of our many popular series; otherwise Jerrold only lives now as a figure (and not always in an amiable light) in the memorials and reminiscences of his age, and as one of the original pillars of that permanently popular institution "Punch." He was also the author of "Black-Eyed Susan, or All in the Downs," a play which has had in its day a very great success. The anniversary will no doubt be commemorated by "Mr. Punch"; it is not conspicuously anyone else's business.

✧ ✧ ✧

A correspondent of the New York "Nation" writes thus as to his experience of the duty levied by the United States on books printed in England:—

If Congress begns to lessen the surplus in the Treasury by cutting off sources of revenue, or if "a scientific tariff revision" takes place, the duty on books printed in England might be spared without loss to infant industries. The following is an example of the present working—not an isolated case, as I, and doubtless many others, can testify. As a member of the British Congress of Tuberculosis, the printed transactions of the Congress were recently sent to me. I do not know the market price of the four small volumes but, as they are given to each member who paid the fee of five dollars, it is not likely to exceed this amount. The customs charges were 2.50 dollars, with sixty cents more for "warehouse." An examiner once remarked to me, when putting me throough the Custom House, that it was "no sanitarium." This recent experience makes me think he was right.

✧ ✧ ✧

In "Cornhill" for this month there is an article by Madame Sarah Bernhardt on "The Moral Influence of the Theatre." Madame Bernhardt is naturally enthusiastic over her progression. The theatre, she says, "is the temple of all the arts which beautify life, and it in this that its power lies. For whereas a library, a picture-gallery, or a concert hall, each enthroning its respective art, has each its particular admirers, the theatre by the service of literature, the fine arts, and music, has a stronger claim upon human sympathy, and thus obtains a wider hearing." Madame Bernhardt deplores the lack of interest shown by the Latin races in pure drama. "The French," she says, "seem to like going to the theatre merely to amuse themselves, if it is not a question of going elsewhere."

✧ ✧ ✧

In view of a recent battle-royal, a rather special interest attaches to an article in the January "Macmillan" on "The Art of Literary Controversy," though it may be doubted whether the quotation with which the article opens will please either of the late combatants. It is the "Autocrat's" remark that "controversy equalises fools and wise men, and the fools know it." The writer, Mr. R. E. Vernede, declares that he remembers only one friendly controversy in which the opponents made clear their issue, that conducted in the "Fortnightly" between Robert Louis Stevenson and Mr. Henry James, "and there again the issue (which amounted to 'What is the end of art?') was so vast that those two delightful writers came forth from it equally scathless and equally unsuccessful, having hardly crossed swords." It was not, as Mr. Vernede thinks, in opposition to Mr. George Moore that Sir Walter Besant "bestrode the tolerably lively corpse of Mr. Kipling"; his adversary, or provocateur, was Mr. Robert Buchanan.

✧ ✧ ✧

Among the novels we have to look forward to this year, according to the "Bookman," are "The Paradise of Dominic Inglesias," by "Lucas Malet"; "Double Harness," by Mr. Anthony Hope; "Barlasch of the Guard," by Mr. Seton Merriman (to run as a serial in "Cornhill"); and a whimsical comedy of Oxford life by Mr. Max Beerbohm, to be entitled "Zuleika Dobson."

✧ ✧ ✧

It is stated that a three-act drama in blank verse by the Poet Laureate, entitled "Flodden Field," has been accepted by Mr. Tree for production at His Majesty's Theatre. Mr. Austin being a poet in office naturally has many hostile critics, and some of these will perhaps recall a dictum of Mr. Austin's in a recent lecture in Edinburgh that "by dramatic writers he did not mean writers who concocted plays in verse that lent themselves to the self-love of this or that actor, or to showy stage-mounting for the delectation of the theatre-going public of the hour."

✧ ✧ ✧

The "Magazine of Art" starts the new year well. There are several interesting articles in the January number, including a fac-simile reproduction of Mr. Watts' first picture in oils, and an original poem by Mr. Watts-Dunton. Mrs. Perugini contributes the first part of a paper on "Charles Dickens as a Lover of Art and Artists," and reproduces the drawing by Maclise showing four of the novelist's children in their very youthful days, in company with the historic raven at Devonshire Terrace. Mrs. Perugini says: "My father knew nothing of the technique of painting, and could scarcely draw a straight line himself. . . . He had no doubt a strong natural desire for art, and there are in many of his books descriptions of sunsets, storms, river scenes, old cathedral towns, and landscapes, scenes of sweet and peaceful content or of sombre dark clouds and sinister suggestion which only a writer with an innate feeling for artistic effect could possibly have described. . . ." Excepting in his "Pictures from Italy," where he speaks very frankly of his likes and dislikes, Dickens was, we are told, ordinarily a silent and attentive listener rather than a talker in any discussion upon art that took place in his presence.

✧ ✧ ✧

The "Burial of Sir John Moore at Corunna" is a most unfortunate poem in its treatment at the hands of fact. Some time ago the prosaic investigator discovered that the "struggling moonbeams" could not have been real, but only, so to say, moonshine; for there was no moon that night. Now we find that it was not night at all when Sir John was buried. To the Museum of the Royal United Service Institution in Whitehall has just been added the prayer-book from which Dr. Symons, the chaplain, read the service. With this is a memorandum in which the chaplain says that "it now being now daylight the enemy discovered that the troops had been withdrawn and embarking during the night, fire was opened by them shortly after upon the ships that were still in the harbour. The funeral service was, therefore, performed without delay, as we were exposed to the fire of the guns." As the month was January it appears that the burial took place at about eight in the morning.

SCIENTIFIC TOPICS.

Through the liberality of George W. Perkins, of New York, an expedition was sent by the New York Botanical Garden to Nova Scotia and Newfoundland. The expedition has secured over 12,000 specimens of over 2,000 species of plants. A third of the specimens are marine plants.

✧ ✧ ✧

Henry Finne, Norwegian of Stavanger, has invented a machine which has marvellous capacity for making the boxes in which sardines and anchovies are packed. Hitherto a skilled labourer could make about six hundred tins per day, but by the use of this machine about eighteen thousand can be turned out with the same labour.

✧ ✧ ✧

The recent expedition sent to North Montana by the New York Botanical Garden has done much in the interest of scientific botany. Many Alpine forms of plants were discovered. Ample statistics were secured establishing the variation of plant life caused by temperature and latitude, and of the general vertical distribution of flora.

✧ ✧ ✧

Recently at an auction sale in London which was judiciously advertised, an egg of the great auk was put up which, after some lively bidding, was knocked down for 1,260 dollars. That is said to be a very good price. But auk eggs have been sold in London for as much as 1,500 dollars. The reason for these enormous prices is naturally to be found in the scarcity of the eggs. The bird is extinct, and not over seventy of its eggs are in existence.

✧ ✧ ✧

Charles Rothschild has perhaps the most curious museum of any collector in Europe. At Tring Park he keeps thousands and thousands of fleas. The museum is in charge of Dr. Jordan. Every animal and bird has its particular kind of flea. Very many have several different kinds. It clearly follows that the gathering of fleas affords diverse material for the collector. In the Rothschild collection is one mole flea (Hystrichopsylla talpæ) a fifth of an inch in length.

✧ ✧ ✧

Charles Gilmore, of Laramie, and E. B. Cavell, who have been at work all summer in the fossil fields at Medicine Bow for the Carnegie Institute at Pittsburg, have dropped their work for the winter. The summer netted them about a carload of fossils, which will be shipped to Pittsburg. The finds were numerous and valuable, though no astonishing results followed their labours. Walter Granger, who is at work in the Medicine Bow field for the American Museum of Natural History of New York, also has a carload of fossils to go forward, but he will remain in the field for the time being. He reports a large number of curious and valuable finds, and expects to return to this field next summer.

✧ ✧ ✧

John H. Felmlee, an inventor, of Pittsburg, Pa., has just perfected a wrapping machine which will handle with great rapidity a piece of any size from a caramel to a cake of soap, and wrap it up in a faultless manner. A company has been formed, and will soon be engaged in the manufacture of the machines to meet the requirements of various industries. The machine performs about forty different operations, including the cutting of the paper from a roll. A machine has been constructed which is worked by hand, and the inventor says the capacity of this is 175 pieces per hour, but this would be greatly increased by driving it with an engine.

✧ ✧ ✧

A pressure-recording oarlock has been invented by Prof. W. C. Marshall, instructor at the Sheffield Scientific School at Yale. The device will be of great value in the selection and training of oarsmen, and it will be put to the test next fall in the selection of candidates. The apparatus weighs only about three pounds, and is placed on the end of the outrigger in the place of the usual oarlock. By its use, the pressure exerted at every stroke is measured and registered, so that accurate comparisons can be made of the actual work done by a man at start and finish. This record can be kept for a distance of four miles. Application has been made for a patent.

✧ ✧ ✧

Former State Senator James Arkell, of New York, who died during the early part of August, was a holder of a number of valuable patents covering the manufacture of paper for various special purposes. Some time ago he devised a method of making a paper which had the quality of stretching slightly without breaking, and this came into great demand for the lining of sugar barrels and other similar purposes. This paper was yielding only in one direction, and he more recently improved on the process and succeeded in making the paper more elastic than ever. He was an Englishman by birth, and came to this country when quite a boy and began life on a farm. He soon after drifted into the newspaper business, and managed a local paper. From this he went into paper making. During the Civil War he made a great deal of money out of the manufacture of paper sacks by a process which he devised.

✧ ✧ ✧

The Northern California Power Company, which furnishes power to a great variety of industries in one of the most prosperous sections of California, has recently installed a 4,000 horse-power generating plant at the Cow Creek station, which is situated in the high Sierras and is typical of the many transmission plants which have recently been installed in California. The ultimate capacity of the station will be 8,000 horse-power when the demand for power reaches this amount. The company has already installed 3,000 horsepower at another generating station, known as the Battle Creek station, thus making the present total capacity of the company's electrical installation 7,000 horse-power. Among the industries supplied with power by this company are ore-smelters, the city waterworks at Red Bluff and Redding, and the operation of large air compressors at the Mount Copper Company's mine at Iron Mountain.

✧ ✧ ✧

For lighting current is also furnished to the cities of Redding, Red Bluff and Willows, and the towns of Keswick, Cottonwood, Anderson, Corning, and Vina. These towns lie along the Sacramento River, and are located in one of the most fertile valleys in California. Irrigation is necessary on most of the land in this valley, and electrically-driven centrifugal pumps are employed to raise the water to the irrigating ditches. This cheap method of placing in the hands of the farmer the ability to obtain water away from streams and creeks has made him independent of the great water companies, and has rendered it possible to develop large areas of land which would otherwise be practically desert wastes. Many thousands of motors are already in operation in California driving pumps for irrigation work, and immense developments are yet to ensue from this application of electric power. The apparatus which the Northern California Power Company has recently installed in its Cow Creek station consists of two 1,500-kilowatt, three-phase, Westinghouse alternators, which will be driven by impact waterwheels supplied with water under a head of approximately 900 feet.

✧ ✧ ✧

No less a personage than the famous mathematician, Blaise Pascal, is said to have introduced the important vehicle, which we call the "omnibus." Unlike most other men of learning, Pascal was more or less interested in the affairs of practical life. He was the inventor of the push-cart that now perambulates our streets. In 1661 he had large wagons built for regular traffic in the heart of Paris. He allied himself in this undertaking with several influential friends, among whom was the Duke de Roannes. In 1662 Louis XIV. granted letters patent to Pascal, in which it was said that these carriages were intended for the comfort of poor people who had to go to courts of justice, or who were sick and so poor that they could not afford to pay the two pistoles exacted by the chairmen and the drivers of coaches. At first the use of the vehicle was not generally permitted. A royal decree forbade its use by soldiers, pages, lackeys, and other liveried servants, as well as artisans and porters. Pascal, in spite of the fact that he only lived to be thirty-nine, is said to have made no inconsiderable sum out of his invention. After the vehicle had been in use for some sixteen years, it was abandoned for various reasons. It was not until 1812 that it was again introduced, this time in Bordeaux, which city was followed in 1821 by Nantes and in 1827 by Paris. The vehicle was improved and rapidly became popular. Now it has been almost displaced by the tramway. In modern times the vehicle was called an omnibus simply for the reason that it was intended for the carriage of all, without restrictions as to lackeys, pages, or footmen.

✧ ✧ ✧

The Russian Government has completed the surveys for the railroad from Odessa via Nicolaieff and Kherson to Jankoi, on the Sevastopol road, with a branch af about thirty miles to Ochakof. Although this road is principally of strategical value, it will be highly beneficial to the commercial development of the region by opening up a large tract of grain-producing country that has hitherto been severely handicapped owing to the lack of railroad communication. The dredging of the Ochakof bar and estuary of the River Boug—work forming a portion of the general scheme—has been completed. The fairway between the commercial port at Nicolaieff and the sea is now 25 feet deep by 350 feet wide at the bottom, and as it is now buoyed, will be officially thrown open to navigation. By the completion of this dredging nearly all the steamers that visit the Black Sea will be able to load cargoes at Nicolaieff, so that the latter port will become a powerful rival to Odessa in the grain-exporting trade.

✧ ✧ ✧

The directors of the Nord, Ouest, and Orleans railway companies of France, and representatives of Belgian, Dutch, German, Austrian, and English roads recently met at Paris, in order to make arrangements for a through-train service from Paris to Peking. It was shown at this meeting that the trip could be made by way of St. Petersburg and Siberia in eighteen or nineteen days, while the sea route, either by the Suez Canal or the Atlantic and Vancouver, requires from thirty-two to thirty-three days. All that seems necessary at present is an arrangement of time-table connections and the selection of cities in which through tickets may be purchased. It is said that through tickets will be delivered at both Havre and Cherbourg, and trans-Atlantic companies will be able to state before boats leave New York whether or not connection will be made with through trains to the Orient. The same arrangement will be made for the daily service between Southampton and Paris. It was also decided at the recent meeting to form a combination with the trans-American railroads and trans-Pacific lines, so that round-trip tickets from New York to Peking could be sold at the former city, with the privilege of going by the Pacific and returning by the trans-Siberian route, or vice versa. The time required from New York by either route is about the same.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

LONDONDERRY, AUGUST 21, 1787.

Sunday evening, a little after eight o'clock, between Lord Pery's gate and the town of Lucan, Mrs. Cradock was stopped in her carriage by three footpads, one of whom came to the head of the horses, and the other two to the sides of the coach, presenting large holster pistols, swearing that they would blow out their brains if any resistance was made, and demanding their money and watches. Mrs. Cradock gave one of them about ten guineas in a long purse, and a repeating gold watch in a shagreen case, the inner case cut in variegated flowers, the work went on a diamond, and made by Emery, Charing Cross. They took from a lady in the coach half a guinea and some pocket-pieces, one very small, less than a silver penny, with the impression of a mitre; they also took from the servantman a guinea and a half in gold, and then went towards Dublin.

On Saturday last was committed to the New Prison, on a charge of forgery, a man who says his name is M'Gee, who came on Thursday last to Mr. Cash, of Capel street, and bargained with him for a considerable quantity of books, which he proposed exporting to America, and offered for payment two bills, drawn in the name of Waddel Cunningham and Co., of Belfast, on Jackson and Co., London, for fifty guineas each which Mr. Cash, from the manner of the sharper's conduct, entertaining no doubt of the bills, gave him, on settlin, £9 3s. in change, being the balance, and the books were packed up in boxes ready for delivery, when fortunately, Mr. Cash observing one of the bills (for he had sent off the other to a correspondent in London) rather drawn in an unmercantile manner, he went to make enquiry of a gentleman, well acquainted with the hand-writing of the drawer, who assured him it was a forgery. On his return the sharper had brought a car to take the books away, when he was secured, and carried before the sitting justice, where he behaved like an old offender, and refused giving back the money, but at length it was obtained, except about three half guineas, and Mr. Cash gave security to prosecute the offender.

DUBLIN, THURSDAY, AUGUST 30.

The demand for crown glass for the French market, has, we hear, encouraged a wealthy company from England to build a glass house in the neighbourhood of this city: the situation they have chosen, it is said, is at the foot of Ringsend bridge.

DUBLIN, FRIDAY, AUGUST 31.

The following curious attempt to evade justice was made a few days ago. At the last Assizes of Trim one Kelly, a noted robber, was capitally convicted, and received sentence to be executed on Wednesday, the 22nd of August; previous to being led out, he contrived to cut his blankets into stripes of four inches broad, joined the pieces together with strong woollen thread, and formed a double fling, which passed under each ham, and the ends fastened at his neck with an iron hook to receive the rope; thus accoutred, he proceeded to the place of execution, where he addressed the hangman (who, by the bye, is supposed to have been bribed), told him he forgave him, but requested he would draw him close up to the pulley, and when dead to let him down gently; the unfortunate wretch, too confident of success, was shortly after launched from the table, but not having allowed for the extension of the blanket by his own weight, after hanging about eight minutes without appearance of life, the hook fastened in his windpipe, and gave him such exquisite pain that he suddenly raised his arms, seized the rope, and struggled for a considerable time till he expired. After being cut down the whole apparatus was discovered, to the astonishment of the sheriff and a number of gentlemen present.

The Princess Royal Packet lately launched at Pargate for the Channel service, is esteemed a model of elegance, and well deserving the appelation she bears. Last week she made her first voyage to our bay, and much admired by many personages of taste and distinction; the King, Queen, and Prince of Wales packets are also fitted in the most elegant and commodious style, so that passengers to and fro from this kingdom find their voyages uncommonly safe, pleasant, and expeditious.

It is thought that the theatre in Crow street (such is the expedition with which the works there are carrying on) will be ready to open for dramatic representations by the middle of December next.

Early on Saturday morning last the inner office of Mr. Cox, brewer, at James's-gate, was broke open and robbed of cash, watches, and other securities for money, to a considerable amount.

DUBLIN, SATURDAY, SEPTEMBER 1.

A corespondent who has lately viewed the rooms now building by the Dublin Society in Hawkins's street, for the purpose of showing the different pieces of mechanism to be executed under their immediate inspection, expresses the highest satisfaction at their neat and simple elegance, particularly a geometrical staircase, upon a construction entirely new, having no support but the connection of each stair with the other; they are winding, and though each step is four feet broad, the whole is contained in a circle of nine feet diameter. the above ingenious production, we are happy to hear, is designed and executed by an Irish carpenter.

In consequence of a number of armed ruffians, with their faces blackened, having a few nights since broke into the house of one Quirk, a farmer, between Maynooth and Kilcock, and robbing him of 61 guineas (nearly his whole property) which he that day received for cattle sold at a fair, and a number of robberies lately committed in that and the adjoining neighbourhood, a subscription has been most spiritedly set on foot by his Grace the Duke of Leinster, the Right Hon. Mr. Conolly, and the principal gentlemen in the county Kildare, for the purpose of apprehending and bringing to justice these pests of society, which we hope will be attended with most salutary effects, and which spirited conduct we most earnestly hope will be an example to the gentlemen of other counties.

DUBLIN, SATURDAY, SEPTEMBER 1, 1787.

The curiosity of the populace was yesterday forenoon much excited by an odd exhibition in the person of a countryman, who went through several of the most frequented streets of this metropolis on his bare knees. Some private transgression wherewith he charged himself occasioned this singular peregrination, and being fraught with an idea of expiating it by public humiliation, he voluntarily underwent a penance, which, if not efficacious, was at least exceedingly tedious and painful.

DUBLIN, MONDAY, SEPTEMBER 3.

Since the levelling of the Mall in Sackville street the name of it has been changed to Sackville place, and boards to this purpose has been put up. The figure of Neptune, which has been spoken off as the present of his Grace the Duke of Rutland to ornament the place, will not be erected there until the beginning of next spring.

DUBLIN, TUESDAY, SEPTEMBER 4.

We are happy to find that the good intentions of our Legislature, who in the last session of Parliament enacted a Bill for the completion of a survey whereon to erect a canal, on a line from this city through Kilcock, Mullingar, Virginia, etc., is likely to be carried into execution. The numberless advantages of such a navigation are too well known to all that may be eventually concerned, to require elucidation.

The fields on the northern side of Dorset street, which leads by a pathway to Glasmanogue road, are the resort of the lower orders of the people every Sabbath day; where they employ themselves at football, wrestling, leaping, boxing, etc. It is, however, hoped that a stop may be put to such assemblies, where the day which should be devoted to the service of the Almighty is thus prostituted by the "mobility." This has been the place of rendezvous since they were prohibited from meeting in the fields near Merrion Square.

DUBLIN, THURSDAY, SEPTEMBER 6.

On Monday next a Post Assembly will be held at the Tholsel, to take into consideration such an extension of the pipe-water works as may supply an additional number of conduits, or public fountains, in several parts of the city, for the benefit of the poorer inhabitants and other useful purposes.

Some foreigners, seemingly of distinction, having landed late on Tuesday night from on board one of the packets, and among them a French lady, her companion, and a female servant, it was said with some degree of confidence that they were the Count and Countess De la Motte, and some friends, who being apprehensive of being kidnapped in London, by order of the French Court, had resorted to this island as a safer asylum. They were lodged at an eminent hotel in Capel street, and visited by two persons of the first distinction now in town.

On Tuesday afternoon the statue of Minerva, which, with two others, are to decorate the pediment of the new portico of the House of Lords, was raised thereon, and the two other statues are to be put up in the course of the week. Each of these figures are eight feet high, and the production of an Irish artist.

WATERFORD, SEPTEMBER 4.

The utility of the mail coming hither by way of Milford is now clearly evident to every one The despatch is so extraordinary that newspapers and letters arrive in due course, in three days from London to this city; which, before this establishment, never was effected in less than five, by way of Holyhead. The merchants and traders must be materially benefited thereby.

When the military road now making between this city and Cork is completed (by which the distance will be considerably shortened), the merchants and traders of that city will feel the good effects arising from this convenience, as a mail coach will be established between this city and Cork, which will pass and repass, in 12 hours, thrice a week. They will then receive the London intelligence in four days, a circumstance they were before unacquainted with.

(To be continued.)

"DUBLIN PENNY JOURNAL."

Post free to any part of Ireland, Great Britain, Australia, New Zealand, Canada, United States.

Twelve months, 6s 6d; Six months, 3s 3d; Three months 1s 8d.

Printed and published for the proprietors at 90 Middle Abbey street, Dublin, by W. F. Dennehy, to whom all cheques and money orders should be made payable.

Dublin Penny Journal

A Magazine of Art, Archæology, Literature, and Science

Vol. I., No. 43. DUBLIN, SATURDAY, JANUARY 24, 1903. PRICE ONE PENNY.

THE WEST GATE, CLONMEL.

REPRODUCTION OF ILLUSTRATION IN THE "DUBLIN PENNY JOURNAL, 1836.

Above we give a picture of the West Gate, Clonmel, reproduced from the 'Dublin Penny Journal, 1836. The structure once formed part of the old walls of the town, for as the "Parliamentary Gazetteer of Ireland" (1844) informs us, 'Clonmel was at one time a walled and fortified town; but its castle or citadel was demolished in the civil wars of the 17th century, and the other fortifications have in a great measure yielded to the abrasions of time, and the sappings of prolonged National repose. Around three sides of the spacious cemetery, in the midst of which the parish church is situated, are remains of the old town wall, protected at regular intervals by small square towers; and at the north-west angle of the wall is a massive bomb-proof tower called 'The Magazine.' At the west end of the town, on the thoroughfare leading to Cahir, stands one of the old gateways of the wall, a plain obtusely pointed arch, surmounted by a battlemented quadrangular structure of two stories, from one corner of which ascends a circular battlemented turret."

DANIEL O'CONNELL.

A CHARACTER PORTRAIT OF SIXTY YEARS AGO.

(Continued from last week.)

As a professional man, O'Connell is, perhaps, for general business, the most competent advocate at the Irish Bar. Every requisite for a barrister of all-work is combined in him; some in perfection—all in sufficiency. He is not understood to be a deep scientific lawyer. He is, what is far better for himself and his clients, an admirably practical one. He is a thorough adept in all the complicated and fantastic forms with which Justice, like a Chinese monarch, insists that her votaries shall approach her. A suitor advancing towards her throne, cannot go through the evolutions of the indispensable Ko-tou under a more skilful master of the ceremonies. In this department of his profession the knowledge of the practice of the courts, and in a perfect familiarity of the general principles of law that are applicable to questions discussed in open court, O'Connell is on a level with the most experienced of his competitors; and with few exceptions, perhaps with the single one of Mr. Plunkett, he surpasses them all in the vehement and pertinacious talent with which he contends to the last for victory, or, where victory is impossible, for an honourable retreat. If his mind had been duly disciplined, he would have been a first-rate reasoner and a more formidable sophist. He has all the requisites from nature—singular clearness, promptitude, and acuteness. When occasion requires, he evinces a metaphysical subtlety of perception which nothing can elude. The most slippery distinction that glides across him, he can grasp and hold "pressis manibus," until he pleases to set it free. But his argumentative powers lost much of their effect from want of arrangement. His thoughts have too much of the impatience of conscious strength to submit to an orderly disposition. Instead of moving to the conflict in compact array, they rush forward like a tumultary insurgent mass, jostling and overturning one another in the confusion of the charge; and though finally beating down all opposition by sheer strength and numbers, still reminding us of the far greater things they might have achieved had they been better drilled. But O'Connell has by temperament a disdain of every thing that is methodical and sedate. You can see this running through his whole deportment in Court. I never knew a learned personage who resorted so little to the ordinary tricks of his vocation. As he sits waiting till his turn comes to "blaze away," he appears totally exempt from the usual throes and heavings of animo-gestation. There is no hermetically-sealing of the lips, as if nothing could restrain the fermentation within; there are no trances of abstraction, as if the thoughts had left their home on a distant voyage of discovery; no haughty swelling of the mind into alto-relievos on the learned brow—there is nothing of this about O'Connell. On the contrary, his countenance and manners impress you with a notion, that he looks forward to the coming effort as a pastime in which he takes delight. Instead of assuming the "Sir Oracle," he is all gaiety and good-humour, and seldom fails to disturb the gravity of the proceedings by a series of disorderly jokes, for which he is duly rebuked by his antagonists with a solemnity or indignation that provokes a repetition of the offence; but his insubordinate levity is, for the most part, so redeemed by his imperturable good temper that even the judges, when compelled to interfere and pronounce him out of order, are generally shaking their sides as heartily as the most enraptured of his admirers in the galleries. In the midst, however, of this seeming carelessness, his mind is in reality attending with the keenest vigilance to the subject matter of discussion, and the contrast is often quite amusing. While his eyes are wantoning round the court in search of a object to be knocked down by a blow of his boisterous playfulness, or, in a more serious mood, while he is sketching on the margin of his brief the outline of an impossible Republic, or running through a rough calculation of the number of Irishmen capable of bearing pikes according to the latest returns of the population, if the minutest irregularity or misstatement is attempted on the other side, up he is sure to start with all imaginable alertness, and, reassuming the advocate, puts forward his objection with a degree of vigour and perspicuity which manifests that his attention had not wandered for an instant from the business before him.

Mr. O'Conell is in particular request in jury-cases. There he is in his element. Next to the "harp of his country" an Irish jury is the instrument on which he delights to play; and no one better understands its qualities and compass. I have already glanced at his versatility. It is here that it is displayed. His powers as a Nisi Prius advocate consist not so much in the perfection of any of the qualities necessary to the art of persuasion as in the number of them that he has at command, and the skill with which he selects and adapts them to the exigency of each particular case. He has a thorough knowledge of human nature, as it prevails in the class of men whom he has to mould to his purposes. I know of no one that exhibits a more quick and accurate perception of the essential peculiarities of the Irish character. It is not merely with reference to their passions that he understands them, though here he is pre-eminently adroit. He can cajole a dozen of miserable corporation-hacks into the persuasion that the honour of their country is concentrated in their persons. His mere acting on such occasions is admirable: no matter how base and stupid, and how poisoned by political antipathy to himself he may believe them to be, he affects the most complimentary ignorance of their real characters. He hides his scorn and contempt under a look of unbounded reliance. He addresses them with all the deference due to upright and high-minded jurors. He talks to them of "the eyes of all Europe," and the present gratitude of Ireland, and the residuary blessings of posterity, with the most perfidious command of countenance. In short, by dint of unmerited commendations, he belabours them into the belief that, after all, they have some reputation to sustain, and sets them chuckling with anticipated exultation at the honours with which a verdict according to the evidence is to consecrate their names. But, in addition to the art of heating the passions of his hearers to the malleable point, O'Connell manifests powers of observation of another, and, for general purposes, a more valuable kind. He knows that strange modification of humanity, the Irish mind, not only in its moral but in its metaphysical peculiarities. Throw him upon any particular class of men, and you would imagine that he must have lived among them all his life, so intuitively does he accommodate his style of argument to their particular modes of thinking and reasoning. He knows the exact quantity of strict logic which they will bear or can comprehend. Hence, (where it serves his purpose) instead of attempting to drag them along with him, whether they will or no, by a chain of unbroken demonstration, he has the address to make them imagine that their movements are directed solely by themselves. He pays their capacities the compliment of not making things too clear. Familiar with the habitual tendencies of their minds, he contents himself with throwing off rather materials for reasoning than elaborate reasonings—mere fragments, or seeds of thought, which, from his knowledge of the soil in which they drop, he confidently predicts will shoot up and expand into precisely the conclusions that he wants. This method has the disadvantage, as far as personally regards the speaker, of giving the character of more than his usual looseness and irregularity to O'Connell's jury-speeches; but his client, for whom he labours, is a gainer by it—directly in the way I have been stating, and indirectly for this reason, that it keeps the jury in the dark as to the points of the case in which he feels he is weak. By abstaining from a show of rigorous demonstration, where all the argument is evidently upon his side, he excites no suspicion by keeping at an equal distance from topics which he could not venture to approach. This, of course, is not to be taken as O'Connell's invariable manner, for he has no invariable manner, but as a specimen of that dexterous accommodation of particular means to a particular end, from which his general powers as a Nisi Prius advocate may be inferred. And so too of the tone in which he labours to extort a verdict; for though when compelled by circumstances, he can be soft and soothing, as I have above described him, yet on other occasions, where it can be done with safety, he does not hesitate to appraise a jury, whose purity he suspects, of his real opinion of their merits, and indeed, not unfrequently, in the roundest terms defies them to balance for an instant between their malignant prejudices and the clear and resistless justice of the case.

There is one, the most difficult, it is said, and certainly the most anxious and responsible part of an advocate's duties, in which O'Connell is without a rival at the Irish Bar—I

de to his skill in conducting defences in the
wn Court. His ability in this branch of
profession illustrates one of those incon-
encies in his character to which I have
ady adverted. Though habitually so bold
sanguine, he is here a model of fore-
ight and undeviating caution. In his most
d cross-examinations, he never puts a dan-
us question. He presses a witness upon
ateral facts, and beats him down by argu-
nt and jokes and vociferation; but wisely
suming his client to be guilty until he has
good luck to escape conviction, he never
rds the witness an opportunity of repeat-
his original narrative, and perhaps, by
plying an omitted item, of sealing the
m of the accused.

'Connell's ordinary style is vigorous and
ous, but incorrect. The want of compact-
in his periods, however, I attribuate
fly to inattention. He has phrase in abun-
ce at command, and his ear is sensible of
ody. Every now and then he throws off
tences not only free from all defect, but
emely felicitous specimens of diction. As
is general powers of eloquence, he rarely
, in a case admitting of emotion, to make
leep impression upon a jury; and in a
ular assembly he is supreme. Still there
much more of eloquence in his manner and
os than in his conceptions. He unques-
ably proves, by occasional bursts, that the
nents of oratory, and perhaps of the highest
er, are about him; but he has had too
y pressing demands of another kind to dis-
t him from the cultivation of this the
st of all attainments, and accordingly I am
aware that any of his efforts, however able
successful, have deserved, as examples of
lic speaking, to survive the occasion. His
ner, though far from graceful, is earnest
impressive. It has a steady and natural
mth, without any of that snappish anima-
in which gentlemen of the long robe are
ne to indulge. His voice is powerful, and
intonations full and graduated. I under-
d that when first he appeared at the Bar,
accent at once betrayed his foreign educa-
n. To this day there is a remaining dash
Foigardism in his pronounciation of partic-
ar words; but, on the whole, he has
ught himself, as far as delivery is con-
ned, to talk pretty much like a British sub-
t.

t was my original intention to have dwelt
some detail upon O'Connell, as a popular
der, but I have no longer space, and I could
rcely effect my purpose without plunging
o that "sea of troubles," the present poli-
s of Ireland; yet a word or two upon the
ject before I have done. Indeed, in com-
n fairness, I feel bound to correct any de-
ciating inferences that may be drawn from
tone of levity in which I may have
noced at some traits of his public deport-
nt, and which I should have hesitated to
lulge in, if I not given him credit for the
l measure of good humour and good sense,
th can discriminate at once (should these
ges meet his eye) between an inoffensive
ly and a hostile sneer.

O'Connell has been now for three and twenty
ars a busy actor upon an agitated scene.
uring that period no public character has been more zealously extolled, or more cordially reviled. Has the praise or blame been excessive, or has either been undeserved? Has he been a patriot, or an incendiary? for, such are the extreme points of view in which the question of his merits has been discussed by persons, too impassioned and too interested im the result to pronounce a sound opinion upon it. To one, however, who has never been provoked to admire or hate him to excess, the solution may not be difficult. After reviewing the whole of O'Connell's career as a politician, an impartial observer will be disposed to say of him, that he was a man of a strong understanding and of stronger feelings, occupied incessantly, and almost always without due preparation, upon questions where it would have perplexed the wisest to discern the exact medium between disgraceful submission and factious importunity—that by necessity a partisan, he has been steady to his cause, and consistent in his ultimate object, though many times inconsistent in the adoption of the means to obtain it; and that now, in the long run, after all the charges of violence and indiscretion that have been heaped upon him, it is questioned by some of the clearest understandings in England, whether, in the present state of political morals, a more courtly policy than O'Connell's either is, or ever was, calculated to advance the interests of his body. But leaving his political incentives aside, and referring soley to the personal provocations to which he is daily exposed, I should say that it would be utterly unnatural in such a man to be other than violent. To O'Connell, as a barrister, his disqualification is a grievous injustice. It is not in theory alone that it operates. It visits him in the practical details of his professional life, andd in forms the most likely to gall a man of conscious powers andd an ambitious temperament. He has the mortification of being incessantly reminded, that for years past his fortunes have been absolutely at a dead stop, while he was constantly condemned to see men who started with him and after him, none of them his superiors, many of them far beneath him, partially thrust before him, and lifted into stations of honour and emolument to which he is forbidden to aspire. The stoutest adversary of Papal encroachments must admit that there is something irritating in this; for my part, instead of judging harshly of the spirit in which he retaliates, I rather honour the man for the energy with which he wrestles to the last with the system that would keep him down; and if now and then his resistance assumes such a form as to be in itself an evil, I am not sorry, for the sake of freedom and humanity, to see it proved that intolerant laws cannot be enforced without inconvenience. But in general (to speak the truth) O'Connell's vengeance is not of a very deadly description. He is, after all, a man of a kindly and forgiving nature; and, where the general interests of his country are not concerned, is disposed to resent his personal wrongs with great command of temper. His forbearance in this respect is really creditable to him, and the more so as it meets with no return. The admirers of King William have no mercy for a man who, in his seditious mood, is so provoking as to tell the world that their idol was "a Dutch adventurer." Then his intolerable success in a profession where many a staunch Protestant is condemned to starve, and his fashionable house in Merrion square, and, a greater eyesore still, his dashing revolutionary equipage, green carriage, green liveries, and turbulent Popish steeds, prancing over a Protestant pavement, to the terror of Protestant passengers—a nuisance that in the good old times would have been put down by Act of Parliament—these and other provocations of equal publicity, have exposed this learned culprit to the deep and irrevocable detestation of a numerous class of his Majesty's hating subjects in Ireland. And the feeling is duly communicated to the public. The loyal Press of Dublin teems with the most astounding imputations upon his character and motives. As a dish for the periodical libellers of the day, O'Connell is quite a cut-and-come-again, from the crazy Churchman, foaming over the apprehended fall of tithes, down to the political striplings of the College, who, instead of trying their youthful genius upon the cardinal virtues, or "the lawfulness of killing Caesar," devote their hours of classic leisure to the more laudable task of demonstrating, for the comfort of the Orange lodges, that "Counsellor O'Connell carries on a treasonable correspondence with Captain Rock." But the Counsellor, who happens to know a little more of the law of high treason than his accusers, has the good sense to laugh at them and their threats of the hangman. Now that all practical attempts upon his life have been abandoned*, he bears the rest with true Christian patience and contempt; and whenever any of his defamers recant "in extremis" and die good Catholics, as the most bigoted among them are said to do, if the fact be duly certified by his friend, Mr. Denis Scully†, who has quite an instinct for collecting materials touching this portion of secret history, O'Connell, I am assured, not only forgives them all their libels, but contributes liberally towards setting on foot a few expiatory Masses for their souls.

[The End.]

* I allude to what was really a shocking occurrence.—A Corporation has been defined to be "a thing having neither a body to be kicked nor a soul to be damned." With this definition before him, Mr O'Connell did not imagine that he exceeded the limits of public debate in calling the Dublin Corporation a "beggarly Corporation." One of its most needy members, however, either volunteered or was incited to think otherwise, and called upon the speaker to apologise or fight. To Mr. O'Connell, a life of vital importance to a numerous family, and of great importnace to the best part of the Irish public, the alternative was dreadful. He saw the ferocity of the transaction in its full light, but he committed his conduct to the decision of his friends, and a duel ensued. The aggressor was killed. Had the result been different, his claims would probably not have been overlooked by the patrons of the time (1815); at least such is understood to have been the expectation under which he provoked his fate.

† The Catholic barrister, a gentleman quite clever and important enough to be treated apart. For the present, I shall merely record of him that one of his favourite theories is, that no rank Orangeman ever "dies game." He can tell you the exact moment when Doctor Duigenan began to roar out for a priest. He has a large stock of mortuary anecdotes illustrating his general doctrine, and he relates them with true Sardonic vivacity.

SLIABH-NA-MON,

AND

Its Fenian Traditions.

SUPPLEMENTARY NOTES BY REV. J. F. LYNCH.

VIII.

In this description Dubhthach is said to have an otter on each shoulder, and in "Silva Gadelica," p. 526, we are told that Liamhain, from whom was named Dunlavin, was wife of Fomu(34), and daughter of Dubhthach dubhtaire mac Fergna, King of the Decies of Bregia; but in "Silva Gadelica," p. 170, Liamhain of Dun Liamhana is said to be daughter of Dobhran dubhtaire, and it at once follows that Dubhthach dubhtaire and Dobhran dubhtaire must be equated; but Dobhran means otter, and hence in this case, also, Dubhthach is connected with the otter. Liamhain is a word meaning water, river, or lake, and it has the same origin as Leamhan, the old name of the River Laune, which flows from the Lake of Killarney into Castlemaine Harbour. Magh Lemna was the name of the plain of Clogher, in county Tyrone. Aboud two miles west of Lough Gur there is a district beside a bog which was formerly site of lake, and the name appears in State Paper dated 1200 A.D., as Liamhain. Near shore of the old lake is a stone circle, called Bailey's Drive by the people. I think that Bailey is the Irish baile, "a place," adopted from the name of the townland Ballycullane. On Knockderc, about a mile south of Lough Gur, is a stone chair named Chair Bailey, and the place of the chair is Moggabailey, for young men up to a recent period assembled there for celebration of games. In State Paper, A.D. 1200, this place is called Bali I nacalligi, that is, Baile na Caillighe, or "place of the hag."

In the tale of the Volsungs and Niblungs, translated from the Icelandic, by Eirikr Magnusson and William Morris, we read, that Fafnir the dragon, Otr the otter, and Regin the master-smith, were three brothers, that Otr, and Andvari a dwarf, in shape of a pike, dwelt in Andvari's waterfall, that the otter was slain by Loki, who had to go to Ran, wife of Aegir the Sea, for her net in which to catch Andvari, in order to obtain possession of his hoard of gold which Odin, Loki, and Hoenir had to pay as ransom to Hreidmar, the father of Otr. On the death of Hreidmar the gold, which has been cursed by Andvari, son of Oinn, is seized by Fafnir, who is slain by Sigurd with the sword made by Regin from the shards of Gram, the name of the sword of Sigmund, father of Sigurd. Regin drinks the blood of Fafnir, and then, having ordered Sigurd to roast the heart of Fafnir for him, goes to sleep while the heart is roasting.

"Therewith Sigurd cut out the heart of the worm with the sword called Ridil; but Regin drank of Fafnir's blood, and spake, 'Grant me a boon, and do a thing little for thee to do. Bear the heart to the fire, and roast it, and give me thereof to eat.' Then Sigurd went his way, and roasted it on a rod; and when the blood bubbled out, he laid his finger thereon to essay it, if it were fully done; and then he set his finger in his mouth, and lo! when the heart-blood of the worm touched his tongue, straightway he knew the voice of all fowls, and heard withal how the wood-peckers chattered in the brake beside him."

Sigurd having been told that if Regin awoke, and ate the heart of Fafnir, that he would slay him, accordingly slew Regin. This tale may be compared with the Irish tale of Finn and the Canuran Caoch. I have taken the Icelandic tale from "The Story of the Volsungs," edited for the Scott Library, by H. H. Sparling, who says that "the otter was held sacred by Norsefolk and figures in the myth and legend of most races besides; to this day its killing is held a great crime by the Parsees (Haug., 'Religion of the Parsees,' p. 212)." The skin of the otter had to be filled with gold, and covered on the outside with gold, and Mr. Sparling compares with this the penalty exacted for killing the cat of the Welsh King ("Ancient Laws and Institutes of Wales." Ed. Aneurin Owen. Longman, London, 1841, 2 vols).

In Aided Echac maic maireda, or "The Destruction of Eocho mac Mairedo," edited and translated by O'Beirne Crowe, we have the following account of the killing of the lap-dog, or otter of Liban:—

Tanic laech forgrainni, dub, mor, ocus romarb side a mesan-si. Foracaib-si do side ocus di a tuaith an gaisced fair an otraigib, ocus can an uile do digail doib no co rotroisetis acci-si: There came up a terrible black, large hero, and he killed her lap-dog. She left to him and his tribe their heroism on their filths and inability to avenge evils done to them, until they should fast at her hands." The tale of Lough Neagh has been altered by some early Christian writer, but it is not difficult to obtain from his version the material which came to him from a very early period; and in dealing with those Irish tales and monuments we must make allowance for various changes. In this article I have had much to do with the Fianna, or Fene, and I have treated the names which came under notice as belonging to the mythology, but in order not to be misunderstood, I wish to state that I am of opinion that there was a race of men in Ireland named Fene, who appear to be identical with the Iberians, considered by the bards to be the guards of Erinn, who are marching now from Ivernis, and who, we now know, were the Neolithic colonists of Ireland. We also know from the discoveries made by Professor Flinders Petrie, in Egypt, that the earliest white colonists of Egypt were a long-headed race, and we also know from the recent discoveries made in Palestine, that a similar race were the Neolithic colonists of that land. The late Canon Isaac Taylor and the Rev. S. Baring-Gould wrote in favour of the theory that the Neolithic colonists of Syria, Arabia, North Africa, and the British Isles, were the same race, and recent discoveries appear to be in favour of this theory. I think that the name Fene will consequently be of considerable importance as the name of the Neolithic folk of Ireland, who differed very much, according to Mr. Baring-Gould, from their palaeolithic predecessors, who curiously correspond to the Formorians, and the names of the Fene which occur in the mythology may be regarded as the sacred names of the Fene; and if the Iberian theory be found to be a true one, then it is hardly necessary for me to say that the Fenian names will be of supreme importance. The name Fene is from Fian, and this word Fian may be, I think, referred to the root, Fi, which means light.

Beside St. Patrick's Well, about a mile south of Lough Gur, we have identified Domnach mor Maighe Ane, "great church of the plain of Ane," of "Tripartite Life of St. Patrick," and Dun noac Fene, or "fort of the youths or warriors of the Fene," and in this case it appears to me that we must equate the Fene with the Iberians. O'Donovan ("Supplement to O'Reilly," p. 676), quotes a passage from the "Book of Lismore" concerning the Mairtine, and there can be no doubt about the Mairtine being a remnant of the old Iberian race in Limerick; and in this passage we find that "Druim meadhoin Mairtine" corresponds to "Ard-chluain na Fene." O'Curry ("Lectures," p. 486) quotes an old poem ascribed to Dubhthach Ua Lugair, in which we read concerning Crimthann, the famous King of Leinster:—

Bassil Siuir dar glun agraige,
Sech Dun Sige.
Cosnamaid h Erend uile,
Echtach Ane,
Atchess midac Maige Fine
Sech Ess Maige.

The Siuir flowed over the knees of his horses,
Passing by Dun Sige.
The conqueror of Erinn all,
The victor of (Cnoc) Ane,
The hero of Magh Fine was seen
Passing over Ess Maighe.

O'Curry thinks that Magh Fine was in Leinster, but there can be no doubt from the context of its being near Knockaine, and if O'Curry was aware that Dun noac Fene was near Knockaine (Cnoc Aine), he would doubtless have suggested that Magh Fine, that is, Magh Fene, was another name for Magh Aine, the name of the plain on which was raised Dun noac Fene, mentioned in "Tripartite Life of St. Patrick." Ess Maighe means waterfall of the River Maigue, and Caherass, that is, Cathair Essa, was a very important fort which guarded the ford beside the waterfall, and over this ford passed the road leading from South Limerick to Connaught, and the yew tree of Fer Fi grew beside this waterfall, for which see O'Curry's "Manners and Customs."

Professor Rhys considers that the Fene are quite mythical, and such appears to be the general opinion of those who have given attention to the mythology, but I have now given my reasons for the supposition that the Fene were the short, dark-haired, and long-headed race who reached Ireland so long ago, and raised those stones on Slievenaman, and Magh Feimhin, and told those tales which contain in them echoes of the legends told beside the Iberian watch-fires on the plains of Asia and on the shores of the Mediterranean, of which our old folk are so fond, for the surest and swiftest way to an old Irishman's heart is to tell him a tale of the Fene.

In connecting the Irish word Femeann with the English word woman and Latin femina, and probably German weib, I have omitted to state that I think the Irish Femeann is a combination of two old words,

(34) It appears to me that in this word Fomu we have the word mu, which is description of the growth of vegetation, production, fertility, etc. Mumu is the name of the southern province, which was regarded as the most fertile of the provinces, and hence the name Mumu, from root mu. Semitic scholars are now of opinion that the name of the letter M, in Hebrew and Phoenician, Mem, and in Arabic, Mim, does not mean water as Gesenius thought, but that it comes from the Assyrian root mu, to grow, to sprout; and in the pictorial script of Shumir, or Shinar, this letter is denoted by a growth of herbage. The Egyptian M is represented by the mulotch, or "horned owl," the first letter of this word begins with M. The Magi of Chaldoea applied the term mummu, mumma, or muma, from root mu, to the earth as containing the seeds of life, and it is strange that the Magi of Ireland made use of a similar term, and applied it in a similar way to the southern province of Ireland.

and that on account of this, the word Femeann has not the same signification as the Irish bean, "a woman," which is cognate with the Greek gune, English queen, and Gothic quino. In English we have the words woman or wife, and queen, corresponding to the Irish Femeann and ban, and I think that the word woman, if cognate with Irish femeann and Latin femina, must be regarded as a compound. In the old Irish tales we have two separate symbols for Femeann, one named Fe (Fia or Fa), and the other Meann or Men (Ma-n), and I think that this symbolism belongs to an old period, and is not a mere philological guess like many of the explanations given in "Dinnshenchas." Keating says that the plain of Femeann was named from the two oxen of the two women, and in "Silva Gadeica," p. 160, a place on or just at south side of Sliabh Fuaid, in county of Armagh, is named Caorthann ban fionn, or "rowan-tree of the white women," and Caorthann cluana dha dhamh, or "rowan-tree of the lawn of the two oxen." It appears from the "Chase of Sliabh Fuaid," in Os. vi., that there were two women named Glanluadh and Ailne connected with Sliabh Fuaid, and Dun an oir of Gleann an Smoil, and the two women, named Danann and Beuchuill, are the owners of the two oxen, according to Keating. It appears to me that we may equate the two oxen of Sliabh Fuaid, in which was Sid of Finnshad, with the two oxen of the plain of Femeann, and the two women of Sliabh Fuaid with the two named Glanluadh and Ailne, who may, I think, be connected with the Sid of Femeann, and hence the white women of Sliabh na mBan fionn are Danann and Beuchuill. I have already explained that Danann was the moon goddess, and Beuchuill, which means wife of Coll, or "hazel," appears to represent the sun. It also seems to me that the two oxen, like the two women, are symbols of moon and sun. The rowan-tree was also a sacred tree with the Teutons, and Professor Rhys says that the old Norsemen regarded the rowan-tree as sacred to Thor, from whom Thursday was named by the Saxons. The rowan-tree* was held sacred on account of the berries, red and bright, and as Thor was the god of lightning, or light, the rowan-tree was made sacred to him; while in Ireland the tree, which is mentioned in numberless tales, was for similar reason made sacred to the deities named from sun and moon. With regard to the white bull with red ears, I take the following extract from Rev. R. Owen's "Kymry," p. 53:—"The laws of Howel Dda rates the fine for insulting the Prince of Aberffraw at a hundred kine for every cantrev belonging to him; a white bull with red ears to every hundred kine; and a gold rod as long as himself and equal in roundness to his little finger, and as thick as the nail of a husbandman who has served for nine years." The ear occurs as a symbol in several Irish tales, but has no reference, as one might think, to ideas of hearing, obeying, glory, etc., but it is connected with ideas of bearing, growth, perfection, etc. The Irish au, "the ear," is connected with the Latin auris from ausis, Greek ous, of which the genitive is otos, Slavonian ucho, of which the genitive is usese, Anglo-Saxon eare, from ease, English ear for eas, and German ohr for aus; so we see that the letter S has fallen from the Irish word. The Hebrew word for ear is ozen, the Arabic uzn, Assyrian uznu. The Egyptian words for ear are athen, mester, and ankh. The word ankh, which is the term for the crux ansata, or Egyptian symbol of life, is also a word for flower; and I think that the word mester comes from mest, or mes, to produce, and also means son. The Irish aus, English eas, Greek ous, and Arabic and Hebrew uzen, and Egyptian athen, compare very well, and as the letters s, z, and t, are interchangeable letters, it is possible that these various words for ear have a common source, and that the source meaning of the word is growth, as shown by the Egyptian names, mester and ankh, and the symbolism of the ear in the Irish tales. In the Oxford Hebrew Lexicon the Hebrew ozen, as applied to ear, is supposed to mean pointed; but this is a mere guess, and in other Hebrew Lexicons other source meanings are suggested.

In a future article I shall connect the Irish article, pronouns, and numerals with the article, pronouns, and numerals of the Egyptian and Semitic languages, and from this connection, which will be fully made out, we may expect and look for cognate words in Irish, Egyptian, and Semitic languages, of which I hope to give examples.

[THE END.]

Dr. Oliver P. Hay, of the American Museum of Natural History, has found the humerus or upper wing bone of a great auk's wing among a number of bones and shells sent to the Museum for examination by the State Geologist of Indiana. The bird has been extinct since 1844. The most remarkable thing about the discovery is that the bone was dug from a mound at Ormond on the South coast of Florida. The North coast of Massachusetts is generally supposed to have been the most southern point the bird ever reached.

---

* Professor Rhys in "Hibbert Lectures" says that he is unable to explain the reason why the rowan-tree was made a sacred tree, but in the "Pursuit" the berries are regarded as the food of the Tuatha De Danann, or gods of light, and so I think that the tree, on account of the berries, was made sacred to light, as was the sycamore in Egypt on account of its vitality. "Hone" (p. 466) says that the anti-witching properties of the mountain ash, or rowan-tree are held in high esteem in which the northern counties of England, and that the churn staff must be of rowan, or the witch will spoil the butter. Bowerby says that the rowan-tree was planted before Highland houses to avert "the evil eye," or luck, and was also carried about their persons as a charm; and Evelyn in his "Silva," says "this tree is so sacred in Wales that there is not a churchyard without one of them.' Professor Rhys that the English name rowan appears to be of Scandinavian origin, the O. Norse being reynir, Danish ronne, and Swedish onn, and he adds that the Welsh is cerddin or cerdin, of which the singular are cerddinen and cerdin, and that the Irish name is caerthann, which corresponds in its consonants to cerdin; and he says also that the etymology of these words offers more than one difficulty. The berries are named in Welsh criafil, and in Irish caor, or caer, that is, berry. It appears to me that the Irish word caer has for source meaning, round, and I think that the Danish and Swedish terms and also English and Old Norse for rowan-tree have source meaning of round with reference to berry. In the Welsh and Irish names for rowan-tree we may take caer or cer to be base, meaning berry, or round, and regard thann in the Irish and din in Welsh as extension. With regard to the Irish word caer, or caor, we know that the English word berry must be connected with the O. H. German beri, the Anglo-Saxon being berie; and in this word the letter r is a suffix letter, for berie or beri is connected with the Anglo-Saxon boeg, "a berry," and this is connected with the Latin bacca, which again is cog. with the Greek kokkos, that is, kokos, from root kok; so we see that the Irish word caer is really caeghr, from root cac, or coc, and with this root must also be connected the Irish cor, or car, a round hill, twist, turn, or return. In "Battle of Ventry," p. 47, we have Uair do impoigh a bel ar an tuaigh agus tandagar caera teimeadh fon fhaithcé don billi sin, "for the lip of the axe turned, and there went balls of fire over the plain from that blow." Professor Meyer says that Professor Rhys suggests the translation, "There came berries of fire over the plain from that tree," but Professor Meyer considers that Begley's caor theimtighe, "a thunderbolt," justifies his translation, and I think that is also justifies the explanation now given of the use made of the berry of the rowan-tree in the Irish mythological tales.

THE CALENDAR YEAR.

The measurement of the calendar year comes down to us from the Romans, who modified it a number of times prior to its having been adopted in a definite form, which was framed by Julius Cæsar.

The first Latins fixed the year at 304 days, distributed in ten months, the first of which was March, the others following in the order in which we know them to-day. Romulus accepted this division. But this year did not coincide with the sun's course or that of the moon. Numa Pompilius, his successor, regulated the year anew by the course of the moon, which is 364 days 6 hours and 48 minutes, to which he added one day, as says traditional history, on account of his love for odd numbers. Then, having abstracted from each one of the existing months six days, which without this act would have contained thirty-five or thirty-six days each, he formed out of this surplus two other months, January and February, one of which numbered 29 days and the other 28 days, setting January as the first and February as the last month of the year. It was only subsequently that February was placed between January and March.

All the months had an odd number of days except February, which from this circumstance was classed a fatal one. The solar year, comprising twelve days and a quarter more than the lunar year, there was introduced an intercalating month, which comprised alternately twenty-two and twenty-three days. It was inserted in the calendar after the 23rd of February, and bore the name of Mercedonius, in honour of the goddess Mercedonia, the patroness of merchants. Nevertheless, with this system, King Numa's year was one day too long, and did not conform any longer to the course of the sun; and this is the reason why Servius Tullius settled that every twenty-three or twenty-four years this month of Mercedonius should be omitted.

This regulation remained, however, nothing formal, and it remained at the disposition of the astronomical pontiffs intrusted to publish the changes of the moon. It was in Rome as with us politics were of prevailing importance with the Romans, in fact much more than with us. When the pontiffs found at the head of responsible public trusts persons they were dissatisfied with they would shorten the duration of their term by shortening the year. And per contra, when their friends were in power they managed to frame the year to the remotest possible period. Under this condition of computation up to Cæsar's time, it was thus that the beginning of the year was 67 days in arrears.

Cæsar desired then to effect a radical and serious change in creating what was termed the Julian calendar. He first caused the 67 days to be continued on the intercalating month, which addition constituted a very extraordinary year of 445 days, known as the year of confusion. He afterwards decreed that henceforth the year would be reckoned as 365 days and 6 hours, and that these 6 hours, forming in time one day, should be added in after the 6th of the calends of March. This Julian year, so named then from Julius Cæsar, remained in use in the entire world until the reform which was operated in 1581 by Pope Gregory XIII., which bore the appellation of the Gregorian calendar. Nevertheless, Cæsar, in establishing the solar year at 365 days and 6 hours, had given an excess of 11 minutes 10 seconds and 4.10, which during the space of 130 years gives a difference of one entire day.

With time this error produced a perturbation by which, in the sixteenth century, the days and nights were in arrears of ten entire days on the period of movements of the sun and of the moon. A fresh reckoning became necessaray, and in order to regain these days in arrears it was ordained by Pope Gregory XIII. that the day after the 4th of November, 1582, should be the 15th of November, 1582, and to avoid the recurrence of the same incident it was agreed to suppress three bissextile years in the lapse of 400 years. In order to constitute a regularity in this diminution in the number of these intercalations it was determined to eliminate the bissextile of all the century years, the designating number of which was not a multiple of 400. Accordingly 1600 was a bissextile adopted, while 1700 and 1800 were not; 1900 will not be a bissextile year, but 2000 will be. The Gregorian calendar is adopted by all the Christian nations, except the Russians and the Christians of the Greek Church.

OUR WEEKLY STORY

HOW TED VARLETT KEPT HIS PROMISE.

A TALE OF A FAMOUS SEA FIGHT.

By David Selden.

Up the steep main street of their New England town two lads of about two years under twenty walked slowly in the pleasant April sunshine. The street was steep, running straight up-hill from the pretty river at its foot, and the sidewalk was dappled with flickering shadows made by the elms with their swollen buds and blossoms, intertwining their branches in the soft spring breeze. Each boy had a newspaper in his hand, one the Republican sheet of the town, which boasted the requisite two, the other a Boston paper brought up by the afternoon train, which had passed an hour ago. Both read intently as they walked, bent forward to the ascent of the hill, both wore a look of excitement; one showing by his reddened cheeks and brief ejaculations that he was stirred, the other betraying a deeper feeling to the keen observer in his white cheeks, quick breath, and utter silence.

The shorter of the two, the one who had been exclaiming as he read, crumpled his paper in his hand, pushed his hat back, and said, "By George, I'm going!"

"Of course, Ed," assented his friend, moving his grimly set lips as though with difficulty. "What else could you do?"

The boy he called Ed seemed not to enjoy having his heroism taken for granted. "It's not 'of course,' at all, Ted," he said. "A good many fellows would hesitate about it, and there'll be plenty to go without me; I suppose it won't really be a war, in spite of the croakers."

"When Sumter's fired upon, and surrendered, and the President wants 75,000 men to put down the rebellion, as he says in this proclamation of yesterday, he needn't look any further than right here for one of that seventy-five thousand, and I supposed you'd make another," rejoined Ted, dryly. "I guess it'll be about all the war we want."

"You haven't any mother," said Ed. "You can do what you please, for nobody imagines your uncle'd interfere, but I'm not sure what my mother will say to letting me go."

"It will be the first time your mother ever objected to anything you wanted to do, if she does this time," said Ted. "If you wan't to go, you can all right; you know that, but if you don't, you're not obliged; it's a call for volunteers, not a draft—yet."

"Haven't I said I was going?" demanded Ed. with some irritation. "You couldn't keep me at home."

The friendship between the boys had been the result of accident, rather than choice or sympathy. They had been born, and had lived all their lives in houses that stood side by side; they had been class-mates at school, associates in all pleasures, and some trials, and they liked each other, indeed Ted loved Ed, though his sterling honesty and earnestness could not be unaware of qualities that were totally unlike his own in the jolly boy whose quick wit and tongue and liveliness made him more acceptable among their comrades than sober Ted was. But whatever deficiencies might lurk in Ed's mercurial make-up, he had been too young and untried till now for them to be apparent, and Ted himself did not realise that his affection took the form of protection, not that somewhere in what psychologists would call his "sub-consciousness" lay the feeling that Ed was not to be depended upon.

Now, Sumter had been fired upon, and events were rushing on which were to make men of boys, and weld lightly connected States into a nation. Ted's soul burned within him with a patriotism too deep for words and passionate desire to serve his country. Ed felt pleasantly excited; he longed for adventure; to him it was delightful to read the news that shortened Ted's breath, and he looked forward to enlisting much as he would to playing shortstop in a superior kind of ball match. It was with difficulty that the consent of his mother, "the Widow Allen," her neighbours called her, was obtained to his enlisting; Ed had spoken truly when he said that Ted had no one to consult but himself, but Mrs. Allen could not bring herself to say the fateful yes for a few weeks, so when the lads enlisted it was in May, when the President had made his second call for recruits, this time for three years' service, and part of them to go into the young navy. Both Ed and Ted had a leaning toward this service, so when the opportunity for it offered they embraced it, and left the quiet town for their ship with hearts that beat high at the prospect of seeing the glories of 1812 revived under their very eyes. When the hour of parting came the Widow Allen took both of Ted's hands in her own hard ones.

"You're more like a settled man than a boy, Ted Varlett," she said. "More of a settled man than my poor, gay boy, with his kind heart and lively ways, will ever be. I don't know as I could have brought myself to let him go if he hadn't been going with you. I trust him in your hands, and I want you to promise me faithfully that you'll see him through, and protect him from every kind of danger. I want you should promise it solemnly, Theodore Varlett, and if you do I'll rest satisfied that you'll bring Ed back to me."

Ted looked down at the hands knotted and wrinkled with hard work, the thin hands with prominent veins, and calloused finger-tips, and thought that he had no such hands to be clasped in prayer for him, to work for him, or cling to him. He looked into the patient, hungry eyes imploring him more eloquently than the pleading tongue to watch over Ed, as though he, a boy no older than his mate, held the power over life and death which could fill them with smiles or tears at his will, and realised keenly that there were no mother-eyes to watch or weep for him. "I'll do my best, Mother Allen," was all he said. "I'll watch over Ed as far as lies in my power, and if he does not come back to you it shan't be my fault. I don't know about bringing him back, but I'll try to send him back safe and sound," he added, as though with a sudden presentiment.

"That's all I ask," said the little woman contentedly. "It's borne in on me, somehow, that you'll be able to do what you promise."

And so the boys departed down the steep main street one day, under the elms, now in full leaf, to face not only the world which they had never seen, but the awful stress of such a civil war as had never been fought before upon its teeming surface.

The training of sailors for the navy was necessarily curtailed in those days when actual service was waiting for them; they were appointed to the Congress in the winner following their enlisting, and it was with their full share of the excitement of their mates that they found themselves one of the Federal fleet of five strong warships in the Hampton roads, waiting a probable encounter with the enemy late in February. No stronger fleet of like number existed in all the world; the big sloop Cumberland, with her twenty-four guns, the steam frigate Minnesota, and their own sailing frigate, the Congress, each felt equal to grappling alone with almost anything that came along, and patriotism, confidence in their ships, and inexperience, all combined to make the loyal boys in blue assured of victory.

For some time past Ted had noticed that, contrary to his natural disposition, Ed had grown sullen and taciturn; he showed enthusiasm for his work; indeed, he dropp a remark now and then disparaging his s vice, his commander, his leader, and ev his cause—remarks that had in them a twa of treason, and would have been serious made by any but Ed. Ted set them down his friend's flightiness, however, and paid li attention to them, being engrossed in drama about to be enacted before him, partly by himself.

There were rumours of various sorts afl regarding the steam frigate Merrimac, wh had been rescued by the Confederates from ruin she had been turned into on the seizur the Norfolk navy-yard by Virginia, and m over into an ironclad. The main purport these reports was disparaging to the Merrim but there was enough doubt left for the f glimpse of her to be awaited with ea curiosity, and an impatience which was soon to be allayed.

Ted and Ed leaned over the rail on Congress shortly after the mid-day meal a Saturday morning, when March had completed the first week of its age. war was a year old, and all allusions as to brevity, or the ease of the task either had undertaken were long past; Ted thinking sober thoughts, yet, like the g President, his was not a nature to be heartened by the knowledge of difficult rather did he arouse to meet them with solid courage that weighs chances, and t them gravely. Suddenly Ed grasped his "Look, look there!" he cried. A queer, black object was moving through the wa from the mouth of the Elizabeth River, wh she evidently had just issued, and t neither lad had seen it before, neither dou for a moment what it was.

"The Merrimac!" exclaimed Ted, an the same moment the officer on watch sig her, and gave warning, and all hands ordered to prepare for action.

Attended by her escort of four armed st boats, the Merrimac steamed rapidly dow the Congress. The frigate's guns wer trained on her, and as she came up belched forth their fire simultaneously, the shot rattled off her as though so peas has been blown at her by boys of six pea-shooters. She looked like a floating roof, with a long false bow cleaving the w beyond which projected the iron beak which she was soon to rend the Cumber waiting to receive her. The ship lay a the channel, and the Merrimac, ignorin Congress and her ineffectual fire for present, bore down upon her. Putting steam, she swooped down on the Cumber struck her with her cruel beak, and shelled her with all her guns. There wa an instant of hope as to the result; lik Congress, the Cumberland's fire had no an in the moment of encounter she was Ed fairly shrieked with frenzied de "She's gone, she's done for," he shouted. can't do a thing against that demon."

Ted seized him roughly by the sho "Are you mad, or are you——" He st abruptly at the word he would have ut "What do you mean by shouting ove destruction of the Cumberland? If they heard you, you would have been run the yard-arm without a minute to make peace with God. Are you mad, Ed, or ails you?"

Ed shook off his hand roughly. "Le alone," he muttered. "It's so fine, I which ship was ours. I'm going below; say something I'll be sorry for."

Turning on his heel he disappe Ted looked after him with a troubled f "Fine!" he muttered. "Forgot! Wh Cumberland's going to pieces oefor our and our turn is next! Now, God forgiv if I'm unjust to Ed, but I don't like it." he turned again to the battle, recollectio many things that Ed had said of late co unhidden to his mind.

Lower and lower sank the Cumbreland, while her dead were already floating on the water. Her gallant flag still flew, as she disappeared finally into her grave, and the Merrimac turned back to assail the Congress, which had been run and tugged aground while Ted was watching the tragedy of her sister ship.

The first shell that the Merrimac sent to her killed seventeen men, and the guns of the Congress were almost useless in her present position; two only were available, and these were quickly silenced. She was careening heavily, and it was evident that water was coming in below, though she had not been struck. An officer sent Ted down to discover the source, and he went gladly, being in a fever of anxiety as to Ed, who had not reappeared, and whose post was vacant. He made his way into the hold, and found himself up to his knees in water before he had gone far. Hastening to the point whence it seemed to be coming, it grew deeper, and he heard a sound of ripping boards. A dark form, dimly seen in the shadow, was tearing a hole in the side of the doomed Congress, and letting in the water which would scuttle her even if she might by any chance escape her foe ranging then but a hundred feet from her. Ted sprang forward and seized the wretch by the collar. As he wrenched his head around to look at his face he let go, and fell backward with a groan of horror, for the traitor was—Ed!

"You here?" he gasped, sullen, yet ashamed.

"Yes, I am here," cried Ted, fiercely, forgetting old friendship in sudden hatred for such useless treason in the hour of fate. "Come up above, and before the old Congress goes to pieces she shall hang you."

"Is this your promise to my mother to keep me safe?" asked Ed, struggling ineffectually in his grasp. "No one knows this but you and me. Let me off, Ted, for your promise's sake, and I'll swear I'll do no more harm to your cause."

"My cause! Your cause, too, isn't it? I promised your mother to protect you, but I promised God and Abraham Lincoln to protect my country, and that promise is first," said Ted.

"What harm can you do by letting me off? I'm dead tired of the whole thing, and I wanted to scuttle the old ship, that's all. Do you remember when I was punished two weeks ago for breach of discipline I said I'd get square, and I have. The old hulk will go down, even if the Merriman doesn't sink her, but I'll swear to you that I'll do no more treason, as I suppose you call it, and if you hang me, how can you go back to mother with my blood on your hands?"

Ted stood aghast at this revelation of utter dastardliness, but as he stared at what had been his friend, the memory of old days and the pleading eyes, the worn hands of the mother to whom he had given his solemn promise rose before him.

He shuddered, sick at soul. "If I keep silence, what guarantee can I have that you will keep your oath?" he asked.

"I'll swear it, and if I break it you may kill me," said Ed. "As soon as my time is up I'm going home, and till then I'll be harmless."

"Swear, then," said Ted, turning away. "Look, how the water rushes in! I'll stop this hole with my arm. Swear, and then go up and tell them I am here—I can't hold out long if I lie down in this depth of water. See, I'll give my arm to stop the ravage you have made. Swear to serve the Union, and go, and God forgive you, and forgive me for my weakness in your behalf."

As he spoke, Ted threw himself down in the rapidly increasing waters, thrust his arm through the opening made by Ed's treachery, and raised his head to hear the oath. Holding up his right arm toward heaven, Ed swore, through the din of the Merrimac's fire, to serve his country, and without another word left his comrade alone amid the rattling shells, the rushing waters, his true right arm stopping the hole his friend's traitorous hands had torn.

Coming up on deck, Ed found the battle fought, and lost, if battle it could be called, in which the Congress had had no share. The flag was just hauled down, and the crew, or what survived of them, were about to abandon her.

"Don't leave Ted, sir," said Ed, coming up to one of the officers. "He doesn't know it's all over, and he's down below, stopping with his arm a hole in our side, to keep the water out. If you're going to abandon and burn the ship, for the love of heaven send someone to get him out."

"What's the matter with you that you can't go back to save your friend; he'd do more for you," said the Lieutenant, roughly; he had never liked Ed. "I suppose you're afraid of getting left there yourself. Very well; stay where you are, and I'll get fine old Ted."

He went below, and hastened to the spot where Ed said his friend was keeping off destruction from the Congress as long as he could. He shouted to him before he got to him, but received no answer. Coming closer, he saw the lad lying on his face, and he saw the bleeding stump that had been his arm, severed from his body, and still thrust in what had been a hole small enough to be closed by it. But a shell had come downward through the deck, and torn off the boards around it, the water was pouring in, and only the tilt of the ship as she lay over on her left side left Ted's body visible. The Lieutenant groaned, and raised him; needless task. The shattered shoulder was bare to the bone, the chest was torn no less. Ted was dead, and he had fulfilled his promise; no one now could betray Ed to the punishment he merited.

Rushing back to get aid, the Lieutenant had Ted's mangled body carried ashore as the crew left the Congress, before she was committed to the flames. Out of her four hundred and thirty-four men, but two hundred and eighteen quitted her; the old comrade and shipmate of many of them had slain three hundred odd of his old friends.

The story of the rest of that afternoon, and the attack on the Minnesota, is history's to tell. Night fell, and the Merrimac withdrew, and we know how the Monitor came down in the morning, and saved the day. When the battle was over the Lieutenant of the Congress, a few other of her men, among them Ed, were taken on board the Minnesota, and with them they bore the body of poor Ted, or lucky Ted, who had died so gallantly in the gallant fight. "They wanted to give him a proper funeral," his mates said, and the Minnesota dropped down the Roads just before sunset to perform the task.

The brave right arm which had stopped the way of the waters had been consumed with the ship for which it was given. They wrapped the mangled body of the young hero in a sheet, and sewed it securely in canvas, winding the flag about the yawning wound in the breast which had loved it loyally.

Ed watched the work, silent, morose, conscious-stricken; no one knew, nor ever could know, what was in his mind as he stood on the deck of the Minnesota in the fresh March wind, beside the friend he had, in a sense, slain. The lieutenant of the Congress read the service; around him were gathered the survivors of her crew, and Ed, as Ted's closest friend, stood nearest the solemn white form which had been the boy he had known. No fear now that anyone would ever learn that he had ever been a traitor; Ed wondered dully if it really had been he who had yielded to the base and foolish temptation. Well, Ted had kept the promise he had made to the worn little woman, praying for them both in her quiet New England town; her son, at least, would return to her; Ted had delivered him to her safe.

The lieutenant's voice rose and fell brokenly as the words of the burial service went on; they had all just escaped from the jaws of death, and no man could say what awaited him, and Ted had been well beloved. The grey-haired sailors from the Congress, and even the strangers on the Minnesota, were touched, and uplifted by the manner of his death. The last Amen was uttered sealing the silence which only the trumpet of the archangel would break. As the long, white canvass mass began to slide over the side the sun, which had been hidden by the wind clouds of the uncertain months, broke forth radiant, and the white of the canvas was bathed in crimson.

Not for long; the motion of the solemn form grew rapid from its own weight, and, amid unbroken silence, slid into the ruddy waters, reddened but a few hours before with the flames that burned the Congress, and with the blood of heroes.

The eddies widened, spread out, disappeared—the water lay smooth and unruffled in the glow of the sunset. Ted had given all that he had to give for his friend, and for the Union; his story was ended.

WITHERED FLOWERS.

BY HELENA CALLANAN.

Hidden away from others' sight,
Tied softly round with ribbon white,
I keep a few poor withered flowers,
Dead children of June's sunny hours.
They were the sweet gift of a friend—
With every leaf dear mem'ries blend.
How could I throw my flowers away?
She wore them on her bridal day.

I touch them tenderly as though
They lived and blushed in summer's glow;
Dried leaves, they wear for me a hue
Brighter than roses gemmed with dew.
I prize them for the giver's sake;
I prize them for the thoughts they wake;
Remembrance makes December May—
I cannot throw my flowers away.

Bright orange flowers green maidenhair,
Their fragrance filled the house of prayer;
Of one great joy they were a part—
Small things bring sunshine to the heart.
There is no beauty in them now,
Fast crumbling into dust—but how
Could I despise them in decay?
She wore them on her bridal day.

THE STUDY OF MAN IN ASIA.

Professor G. Frederick Wright, who recently made a trip across Asia for scientific study, says one of the surprises of Siberia is its abundance of public museums, in which special attention is devoted to anthropology. Since Asia has been regarded by many as the original cradle of mankind, this preference for anthropological study is particularly interesting. Professor Wright mentions a dozen cities of Asiatic Russia, including Vladivostok, Irkutsk, Minusinsk, Tomsk, Tashkend, and Tiflis, which contain excellent museums, and he says there is scarcely a town of 10,000 inhabitants in all Siberia which is not thus provided with an educational factor, bearing particularly on the study of the human race, which may well provoke our emulation.

NEW USE FOR ALUMINUM.

Owing to the property which aluminum possesses of producing a very high temperature when burned with substances that give off oxygen, it has lately been employed in Berlin for making a new detonator, for firing explosives which do not readily respond to the action of the detonating compositions hitherto used. The aluminum is used in the shape of a powder mixed with the other substances filling the percussion caps or detonators. The sudden high temperature induced by the pulverised aluminum results in a greater mechanical energy than can be produced with compositions not containing aluminum.

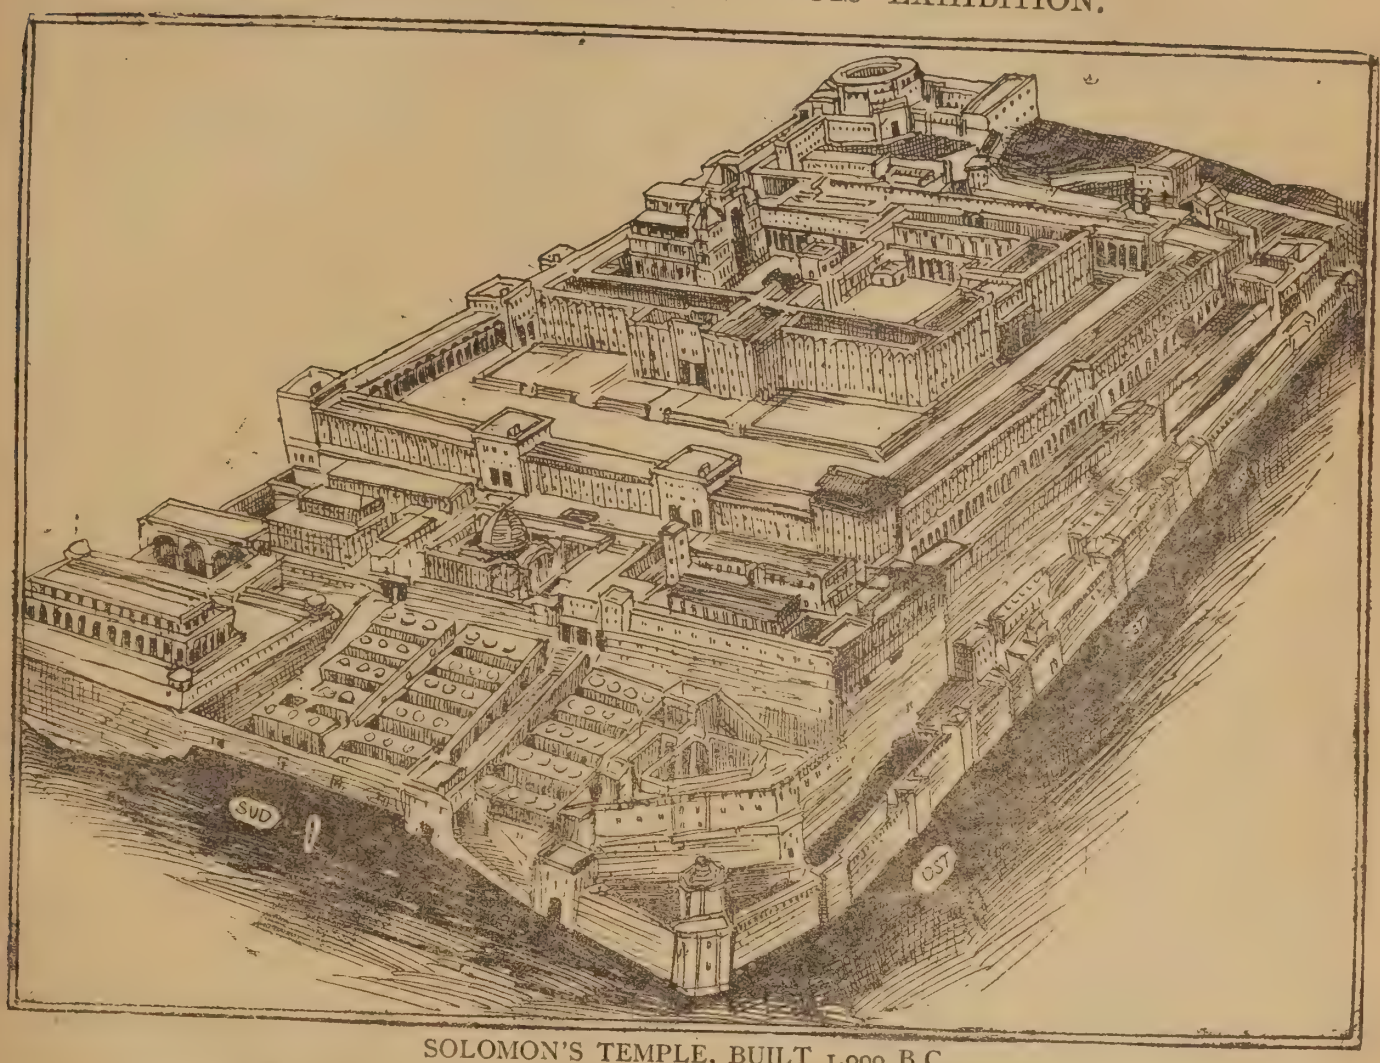
Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

DOWNPATRICK, an unincorporated borough, market, and post-town, and parish, in the barony of Lecale, County of Down (of which it is the chief town), and province of Ulster, 18 miles (S.E. by S.) from Belfast, and 74 (N.) from Dublin; containing 9,203 inhabitants, of which number 4,784 are in the town.

This place, which was anciently the residence of the native kings of Ullagh, or Ulidia ,was originally named "Aras-Celtair" and "Rath-Keltair," one signifying the house and the other the castle or fortification of Celtair, the son of Duach; by Ptolemy it was called "Dunum." Its present name is derived from its situation on a hill, and from its having been the chosen residence of St. Patrick, who, on his arrival here in 432, founded in its vicinity the abbey of Saul, and, shortly after, an abbey of regular canons near the ancient "Doon" or fort , the site of which was granted to him by Dichu, son of Trichem, lord of the country, whom he had converted to the Christian faith. St. Patrick presided over these religious establishments till his death in 493, and was interred in the abbey here, in which also the remains of St. Bridget and St. Columbkill, the two other tutelar saints of Ireland, were subsequently deposited. The town was constantly exposed to the ravages of the Danes, by whom it was plundered and burnt six or seven times between the years 940 and 1111; and on all these occasions the Cathedral was pillaged by them. In 1177 John de Courcy took possession of the town, then the residence of Mac Dunleve, Prince of Ullagh, who, unprepared for defence against an invasion so unexpected, fled precipitately. De Courcy fortified himself here, and maintained his position against all the efforts of Mac Dunleve, aided by the native chieftains, for its recovery. In 1183 he displaced the canons and substituted a society of Benedictine monks from the abbey of St. Werburgh at Chester. Both he and Bishop Malachy III. endowed the abbey with large revenues; and in 1186 they sent an embassy to Pope Urban III. to obtain a bull for translating into shrines the sacred reliques of the three saints above named, which was performed with great solemnity by the Pope's nuncio in the same year. De Courcy, having espoused the claims of Prince Arthur, Luke of Brittany, assumed, in common with other English barons who had obtained extensive settlements in Ireland, an independent state, and renounced his allegiance to King John, who summoned him to appear and do homage. His mandate being treated with contempt, the provoked monarch, in 1203, invested De Lacy and his brother Walter with a commission to enter Ulster and reduce the revolted baron. De Lacy advanced with his troops to Down, where an engagement took place in which he was signally defeated and obliged to retreat with considerable loss of men. De Courcy, however, was ultimately obliged to acknowledge his submission and consent to do homage. A romantic description of the issue of this contest is related by several writers, according to whom De Courcy, after the termination of the battle, challenged De Lacy to single combat, which the latter declined on the plea that his commission, as the King's representative, forbade him to enter the lists against a rebellious subject, and subsequently proclaimed a reward for De Courcy's apprehension, which proving ineffectual, he then prevailed upon his servants by bribes and promises to betray their master. This act of perfidy was carried into execution whilst De Courcy was performing his devotions unarmed in the burial-ground of the Cathedral: the assailants rushed upon him, and slew some of his retinue; De Courcy seized a large wooden cross, with which, being a man of great prowess, he killed thirteen of them, but was overpowered by the rest and bound and led captive to De Lacy, who delivered him a prisoner to the King. In 12[illegible], Hugh de Lacy was made Earl of Ulster, and for a while fixed his residence at the castle erected here by De Courcy. In 1245, part of the abbey was thrown down and the walls of the Cathedral much damaged by an earthquake. A desperate battle was fought in the streets of this town, in 1259, between Stephen de Longespee and the chief of the O'Neils, in which the latter and 352 of his men were slain. Edward Bruce, in his invasion of Ulster, in 1315, having marched hither, plundered and destroyed the abbey, and burnt part of the town: he again plundered the town three years afterwards, and on that occasion caused him to be proclaimed King of Ireland at the cross near the Cathedral. To subdue the opposition raised by the wealthy abbots of this district, under Primate Cromer, against the spiritual supremacy of Hen. VIII., Lord Grey, then Lord Deputy, marched with a powerful army into Lecale, took Dundrum and several other castles, and in May, 1538, having defaced the monuments of the three patron saints and perpetrated other acts of sacrilege, set fire to the Cathedral and the town; three years afterwards, this act was made one of the charges on which he was impeached and beheaded. On the surrender of the abbey in 1539, its possessions, with those of the other religious establishments in the town, were granted to Gerald, eleventh Earl of Kildare. In 1552 the town was plundered and partially destroyed by Con O'Neil, Earl of Tyrone; and two years afterwards it was assaulted by his son Shane, who destroyed its gates and ramparts. During the wars of 1641, the Protestants of the surrounding district having fled hither for protection, the town was attacked by the Irish under the command of Col. Bryan O'Neil, who burnt a magnificent castle erected by Lord Okeham, and committed a great slaughter of the townsmen; many that escaped were afterwards massacred at Killyleagh.

The town is built upon a group of little hills, on the south shore of the western branch of Lough Cone or Strangford Lough. On the eastern side the hills rise abruptly behind it, commanding views of a fertile and well-cultivated tract abounding with richly diversified and picturesque scenery. It is divided according to ancient usage into three districts, called respectively the English Irish, and Scottish quarters. An ancient ferry across the western arm of Strangford Lough connected this town with the neighbourhood to the north until a bridge was erected about one mile from the town, with a tower-gate upon it, which was destroyed and the bridge itself greatly damaged in 1641.



Downpatrick had a corporation at an early period, the existence of which is recognised in 1403, when letters of protection were granted to it by Hen. IV., under the title of the "Mayor, Bailiffs, and Commonalty of the City of Down, in Ulster." The borough returned two members to the Irish Parliament so early as 1585: this privilege was exercised till the Union. The right of election was vested in the pot-wallopers, but under an act of the 35th of Geo. III. it was limited to the resident occupiers of houses of the annual value of £5 and upwards, registered twelve months before the election.

Besides the abbey founded by St. Patrick, there were, prior to the dissolution, a party of regular canons here, called the priory of the Irish, founded in honour of St. Thomas, in 1138, by Malachy O'Morgair, Bishop of Down; the priory of St. John the Baptist, called the priory of the English, founded by John De Courcy for crossbearers of the order of St. Augustine; an abbey of Cistercian monks, founded in the 12th century by — Bagnal, and a Cistercian nunnery, of both which no further particulars have been recorded; a Franciscan friary, founded about 1240 by Hugh de Lacy, or, according to some writers, by Africa, daughter of Godred, King of Man, and wife of John de Courcy; and an hospital for lepers, dedicated to St. Nicholas, which in 1413 was, with the hospital of St. Peter at Kilclief, granted in trust to certain individuals by royal charter: there are no remains of these ancient establishments; even their sites can scarcely be distinctly traced. There are several forts and raths in the parish; the most noted are the large rath or 'doon" near the Cathedral, which gave name to the town and county, and one at Ballykilbeg, finely planted by J. B. Johnston, Esq. In 1825, the head and horns of an elk of large size, the latter measuring 5 feet 11 inches between their extremities, and the head of a spear, were found in a marl-pit near the town. The celebrated Duns Scotus was born here in 1274; he was educated at Oxford, and in 1307 was appointed Regent of Divinity in the schools of Paris; his works are very voluminous.

The so-called gutta-percha tree which has been grown experimentally in the island of Zanzibar appears to be of doubtful enconomic value, as the latex obtained from it loses its plastic character after a few months, and becomes friable.

THE GREAT TEMPLES OF JERUSALEM.

MODELS FOR THE ST. LOUIS EXHIBITION.

SOLOMON'S TEMPLE, BUILT 1,000 B.C.

THE TEMPLE MODELS.

By HAROLD J. SHEPSTONE.

(From the "Scientific American.")

An interesting exhibit of the forthcoming World's Fair at St. Louis will be the late Dr. Schick's famous models of the temples which have stood upon Mount Moriah, Jerusalem. It was on this spot that Solomon built his historic temple, 1,000 years before the birth of Christ. Since that period no less than seven other great structures have in turn occupied the sacred site—two Jewish, one pagan, two Christian, and two Mohammedan. Of these eight buildings, the most notable are the Temple of Solomon, the Temple of Herod, the Church of Justinian, and the present Mosque of Omar.

Dr. Schicke made very elaborate models of these four temples, and his son-in-law, Dr. L. Schoenecke, to whom the models now belong, has decided to exhibit them at the St. Louis Exhibition of 1904. More than ordinary interest attaches to this exhibit, as it will be the first time the models have ever been seen outside of Jerusalem. Previous efforts to secure them for exhibition purposes have always failed. As already stated, they represent the work of the late Dr. Schick, a well-known German archæologist, who gave thirty-two years' patient study to the buildings which have occupied this particular spot during the last 3,000 years. He made a very exhaustive study of the locality itself, as well as of all literature, both sacred and profane, dealing with the ancient buildings. He died on December 23, 1901, at the age of eighty, fifty years of his life having been spent in Jerusalem. "No one living," wrote the Secretary of the Palestine Exploration Fund at Jerusalem at the time of his death, "knew Jerusalem better than he did." He was honoured by several learned societies, and was much sought after by scholars and others interested in the archæology of Palestine.

The models, which are works of art, are of wood, and made to a scale of 1 foot to every 200 feet of the entire plateau, or temple site. They are in many pieces to facilitate removal, and when put together each model forms two quadrangles, each about 9 feet long and 5½ feet wide, and some twenty inches high. The model of Solomon's Temple, for instance, which naturally attracts prior attention, is 18 feet long and nearly 6 feet wide.

Beginning at the south-east corner, we see part of the mount rising in rock steps up to the city wall, the valley of Kedron to the right, and the Tyropœan valley to the left, and inside, the wall of the mills bastion and the "house mills." Following up are two streets leading to the double and triple gates of the "king's house." On a higher terrace is the palace of the king, Solomon. Here to the left is the "house of the forest of Lebanon," and crossing above the double passage we reach the judgment hall, in which was the throne of the king, and, further, after crossing the triple passage, the king's private lodging. Above this terrace of palaces and on a higher level are the outer temple walls and porches forming a great square. Inside the porches extends the outer court, or court of the Gentiles, behind which none but Jews could go. A

rise of twelve steps brings us to another platform or terrace called Chel, or the Rampart, on which stands a large building with three wings and three stories high. Inside this building are the middle court and the inner court. Fifteen steps, on which the Psalm of Degrees was chanted, led up to this inner court, and thence up five steps to the court of the priests, and there, on the holy rock of Sakhra, stood the altar of burnt offerings and the brazen sea. Up twelve steps more, on the highest platform, stood the House of the Lord, where the Ark of the Covenant reposed, beneath the outspread wings of the cherubim of the holy of holies. The house faces to the east. On the north, outside the temple inclosure, we see the fortress with the towers Mea and Hananeel, mentioned by Nehemiah.

(Next week we will give the picture of the model of Herod's Temple, with the accompanying description.)

NOTES AND QUERIES.

THE MacCARTHYS IN FRANCE.

With reference to the note published under the heading, "The MacCarthys More, Reagh and Glas," in the "Dublin Penny Journal" for December 20th last, its writer has since ascertained that although the only son of the Duc de Clancarthy, Blarney, of 12 Rue du Commerce, Nantes, is dead, his daughter's children have assumed the ancient Celtic surname of MacCarthy; so that there is every likelihood of the name and title of Clancarty Blarney surviving, it is to be hoped, for many generations in the friendly land of France.

J. C.

THROWING THE DART IN DUBLIN.

Cork is now the only place in the three kingdoms where the ancient custom of "Throwing the Dart" is still (triennially) kept up, a custom said to be of Danish origin, and observed in former days at several places on the east coast of England. In Dublin, too, though given up a good many years, it appears to have existed till about the beginning of the 19th century, as is evident from the following extract from Wright's "Picture of Dublin," which was published in 1821:—

"The authority of the Lord Mayor extended not only all over the city, but part of the Bay of Dublin is considered within his jurisdiction. The limits of his authority over the watery world are determined in the following manner: At low water his lordship rides to the very water's edge, and from thence throws a dart as far as strength and skill enables him; where it falls is the boundary of his power. His lordship then proceeds to perambulate the bounds of the city, or of his jurisdiction. Upon this occasion, not many years since, all the guilds attended, and formed a procession of great splendour and magnificence."

Evoc.

TRISTAN'S SONG.

By Arthur Symons.

If this be love I die,
I die of hoping love,
That will not hence remove,
Nor will not all deny.

His sharp and bitter dart
Is fast within my side;
Come, my old courage, hide
Thy death within thy heart.

I will not shrink, although
This death in love there be:
She whom I love is she
Who is through love my foe.

THE FIRST MAP BEARING THE NAME OF AMERICA.

By A. GEHLEN.

We have all learned as boys at school that Columbus, the discoverer of America, was deprived of the honour of having the newly-discovered continent called after his name by the German geographer Martin Waldseemuller. It was in his book "'Cosmographiae Introductio,' published at St. Die in the year 1507, that this scientist first proposed the name "America" for the new land, in honour of Amerigo Vespucci, of Florence. The famous passage reads as follows: "Quarta pars (i. e., of the earth) per Amerigum Vesputium . . . inventa est, quam non video cur quis inre vetet ab Americo inventore. . . . Ameriijen quasi Americi terram sive Americam dicendam, cum et Europa et Asia a mulieribus sua sortita sint nomina." ("The fourth continent was discovered by Amerigo Vespucci; and I do not see why one should have any just reason against it, that this country should be called after its discoverer the land of Amerigo or America; for Europe as well as Asia have received their names from women.')

But where was this name of the new world first practically used? What map first bore the name of America

A. von Humboldt, in his "Critical Researches" (Berlin, 1852) still maintained that the map of Apian of the year 1520 had this honour. Scientists, however, soon agreed that there must have been earlier maps that contained the name "America," and Prof. Elter (De Henrico Glareano, Bonn. 1896) demonstrated that a map of the geographer of St. Die must have existed as far back as the year 1507, and that this was the first map that contained the name of America, the later maps (also that of Apian) being to a great extent copies of it. Elter even gave hints for its reconstruction.

But where was this map to be found? To discover it was regarded among specialists as the highest prize of untiring historico-geographical research.

Then, quite unexpectedly, in October, 1901, German, and soon also American journals, brought the news that the map of Waldseemuller, so long forgotten, had at last been found. The fortunate discoverer is the Rev. Joseph Fischer, S.J., Professor of History and Geography at the Stella Matutina Colloge at Feldkirch (Vorarlberg). The recent book of this scientific geographer on "The Discoveries of the Northmen in America" * gives us further information on this interesting subject.

Engaged for more than seven years in scientific investigations on the discoveries of the Northmen in America, Fischer searched, either personally or through his friends, in different libraries and archives of Germany, Austria, Italy, France, and Belgium for documents bearing on the subject of his investigations. How much new material and how many documents he has found, how many questions in the interesting controversy of the Norse discoveries he has solved or brought nearer to their solution is evinced in every part of his book.

The most remarkable discovery, however, of the wars 1507 and 1516 respectively. was that of two large maps of Waldseemuller Fischer himself thus narrates his discovery:

"On the third day of my systematic searching in the library of Prince Waldburg in the folio with the inscription 1515, containing, besides others, two large maps of the world. Each of the maps covers twelve pages, about 580 millimeters in length and 420 millimeters upper part, the following four the middle, the last four the lower part of the map. The two maps together, therefore, comprise 24 pages. This valuable codex was formerly in the possession of John Schoner, the famous mathematician and cartographer. On page 9 Fischer found printed in large letters the name "America." Then followed on the next three pages the title in large capital letters: 'Universalis Cosmographia secundum Ptholomaei traditionem et Americi Vespucci aliorumque lustrationes. ('Universal Cosmography, According to the Traditions of Ptolemy and the Voyages of Amerigo Vespucci and Others.")

The second map bore on the upper margin likewise in big capital letters the title in Latin: "Marine sailing chart, giving the general outlines of the voyages of the Portuguese, as well as the shape and nature, the situation and the boundaries of every known sea and land, as explored in our own times, and differing from the traditions of the ancients, and not mentioned by any of the olden writers.' As to the time of the production of the second map, page 20 mentions expressly that it was printed "on the vigil of Pentecost, 1516." On the following page a long inscription was found, beginning with the words: "Martinus Waldseemuller (!) Ilacomilus lectori felicitatem optat incolumem." ("Martin Waldseemuller wishes the reader unimpaired happiness.") The Carta marina, therefore, was a map of Waldseemuller. And this was affirmed on page 24, which at the same time contained the place where the map was printed.

It was not easy to determine the first map which bore the title "Universalis Cosmographia.' But that also this was the work of Waldseemuller, and that it was completed several years before the Carta marina, was evinced by the legends of both maps; that it is of the year 1507, and that it also was printed at St. Die, was established by Fischer together with his former teacher, Prof. Wieser, of the University of Innsbruck, an authority of the first rank in the science of cartography. Details about it will be given in the preface to the publication in which Fischer and Wieser are about to communicate to the world in fac-simile reproduction the two famous maps so long lost.

Suffice it to say for the present that the famous "Cosmographiae introductio," the writing accompanying the map, already proves its genuineness; all the statements of the "introductio" are verified on the map: the Papal keys, the imperial eagle, the crescent, the crosses signifying dangerous places, the name America, etc.; the Cosmographiae introductio is nothing else than an explanation of this map.

It is interesting to remark that on Waldseemuller's map of the world (Cosmographia universalis) North and South America are separated by an arm of the ocean; that in his Marine Chart (carta marina) the continent opposite the island Isabella (Cuba) is called Terra de Cuba, Asie partis, that therfore Waldseemuller was still of the same opinion as Columbus, that the newly-discovered countries formed the eastern coast of Asia.

Still more interesting is the fact that the German geographer in his second map tried to right the wrong he had done to Columbus. The name of America is here replaced by "Brasilla sive terra papagalli" (parrot s land), and in a legend added to the map Vespucci is named in the third place, while Christopher Columbus is mentioned first: "Hec per Hispanos et Portogalenses frequentatis navigationibus inventa circa annos Domini 1492, quorum capitanei fuere Cristoferus Columbus Ianuensis primus. Petrus Aliares (Cabral) secundus. Albericusque Vesputius tertius." ("These countries were discovered in several voyages about the year of the Lord, 1492, the captains being, first, the Genoese Christopher Columbus, next Peter Alliares (Cabral), and thirdly, Albericus Vespucci.")

But it was too late! The map of 1507 (one thousand copies of which had been printed) and the accompanying Cosmographiae introductio had already spread the name "America" far and wide.

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

By CHARLES SMITH, M.D.

Æquum est enim meminisse & me, qui discerem hominem esse et vos, qui Judicetis ut fi probabilia dicentur nihil ultra requiratis. Cicero Univers

In Two Volumes.
VOL I.
The Second Edition, with Additions.

BOOK II.

Containing the Topographical Description of this County, including the City of Cork.

Chapter I.—Continued.

Agharlow, in the parish of Kibonane, is well improved and planted, also the estate of Mr. French; the parish church is in ruins. About a mile E. by N. from Agharlow is the castle of Kilcrea, formerly a seat of the Earls of Clancarty. It is a strong building, having an excellent staircase, of a dark marble, from bottom to top, about 70 feet high. It stands a little south of the river Bride. The barbicans, platforms, and ditch still remain. On the east side is a large field, called the bawn, the only appendage, formerly, to great men's castles, which places were used for dancing, goaling, and such diversions; pleasure gardens and other improvements being then unknown in this country. In these bawns they also kept their cattle by night, to prevent their being carried off by wolves, or their more rapacious neighbours. Kilcrea (27) was a manor belonging to the Lords Clancarty. Near this castle are some quarries of a fine clouded grey marble, which takes a good polish. About two fields east of this castle are the ruins of the abbey of Kilcrea, founded by Cormac, surnamed Laider, Lord Muskery, for Franciscans: he also built the above-mentioned castle, and was buried in this abbey, an. dom. 1494, being wounded at Carignamuck. The foundation of this abbey was began, according to Ware, in 1465, but the Ulster annals place it in 1478 (28).

An. 1614, Sir Arthur Chichester, Lord Deputy, committed the care of this abbey to Charles MacDermot Mac Carty, Lord of Muskery, who was a Protestant, upon condition that he should not permit the friars to live in it, and that none but English Protestants should be admitted as tenants to the lands. This lord (29) was buried here ann. 1616. A great part of the building still remains, among which is the nave and choir of the church. On the S. side of the former is a handsome arcade of three gothic arches, supported by marble columns, thicker than those of the tuscan order. This arcade continues to form one side of a chapel, being a cross isle. In the choir are some old tombs, several of the Lords Clancarty being here interred (30), as were the Barrets and other principal persons of the country, who always opposed the entire demolishing of this pile. The steeple is a light building, about 80 feet high, placed between the nave and choir; it is still entire, and supported by gothic arches. There is something very awful and solemn when one enters these reverend piles, once erected for the uses of religion. Long sounding aisles, intermingled with graves and human bones, the twilight vaults, the caverns piled with skulls, and the gloomy darkness, occasioned by the height of the walls, overgrown with shrubs and ivy, so sadden all the scene, that he must be a person who never reflects at all if he thinks not of futurity, on entering (as Mr. Pope says)

In those deep solitudes and awful cells,
Where heav'nly pensive contemp ation dwells,
And ever musing melancholy reigns.

From the gateway of this abbey to the road, there are high banks on either side, formed entirely of human bones and skulls, cemented together with moss; and besides great numbers strown about, there are several thousands piled up in the arches, windows, &c., which show this place formerly to have been a very great cemetery (31). At the end of a lane leading to this ruin stands a large wooden cross since the time of the demolition of the abbey, and this entrance is by an avenue of venerable oak. The river Bride winds sweetly away through the vale below this ruin, and turning north falls into the Lee. The Lord of Muskery, at the time of the dissolution, had the lands of this abbey granted to him; but after the wars of 1641, Oliver Cromwell gave them to Lord Broghill. It was in these wars that the greatest part of the building was destroyed; but part of it was afterwards rebuilt by Captain William Baily, who placed a garrison therein.

Kilcrea was purchased by Captain Hedges from the trustees of the hollow-blade company (who bought it after Lord Clancarty's forfeiture). He built here an handsome seat, and adorned it with fine plantations; it is now called Snugborough, and inhabited by Mr. French. A mile north of Kilcrea is Garyhasty, a pleasant country house of Mr. Riggs Faulkner, of Cork, on the S. side of the Bride. And a mile S.E. is Ballygromane, belonging to Mr. Haddock. The lands are dry and fertile, and proper for tillage. To the S. is the parish of Knockavilly, where the soil is, for the most part, cold and bleak; yet being manured with lime, affords good crops of corn.

The Ovens, or St. Owens parish, is washed on the S. and E. sides by the Bride, and on the N. by the Lee. It is a most remarkable cave, beneath a stupendous limestone arch, 12 feet high at the entrance, but declines to less than six. In some places it is higher, and in others so low that one is obliged to creep in advancing through it. The passage is on the W. side, but in about 20 yards the cave winds towards the S. and S.E. Another way leads on due S. to a well about fourscore yards from its entrance. There are many other branches, some running in a serpentine manner, others like so many alleys, crossing each other, mostly so broad that six or eight persons may walk abreast, the whole forming a perfect labyrinth underground. In order to visit these passages, it would be necessary to take the same precaution as Ariadne made

(27) Almost the whole of this barony, before the commencement of the rebellion of 1641, belonged to Donough, Lord Muskery who held it in domain as of fee, and the rest in service, reversion, and remainder. His ancestors, for their fidelity and great services performed to the Crown of England obtained several letters patent, containing large and ample privileges, concessions, and royalties inherent in the Crown. As the creating the castles of Blarney, Kilcrea, and Macroomp, into three several free manors; the whole barony of Muskery (being reputed to have belonged to one or other of those three), yielding and doing suits of court leet, and court baron to them. They had the liberty to erect a free park, consisting of 200 acres, at Blarney, with privileges of free chase, free warren and all others appertaining to the masters of the royal game. To appoint seneschals, and clerks of their markets. They had the disposal of goods of felons and fugitives, and of all the ayries of hawks in their territory. They presented to several parish churches, founded by the lords of the family in this barony. They had also power to hold several fairs and markets. The reserved rent, to the Crown, in the first patents, was only £16 per annum, but in the last patent of King James I, it was raised to £100. This patent was granted to Charles Oge. They were also, by this patent, to pay 3s 4d out of every plowland yearly, as a composition royal, throughout the barony, except some domain lands adjoining to the above manors that were free.

(28) MSS in Marsh's Library.

(29) From him descended Tiege, ancestor to the Cartys, of Aglish; and Daniel, ancestor to the Cartys, of Carignavare.

(30) Viz. Cormac Mac Tiege Carty, called Laider, who founded it, as above. Cormac Oge Laider, his son, buried here, ann. 1536. He fought the celebrated battle of Mourne abbey, where he vanquished the Earl of Desmond. Tiege his son, Lord Muskery buried here, ann. 1565; he was father to Sir Cormac Mac Tiege. Dermot, his son, buried here, ann. 1570, ancestor of the MacCartys of Inshirahill. Cormac, his son, buried here, ann. 1616, who was the last lord of this family that was here interred

(31) This abbey was dedicated to Saint Bridget, according to Wadding. Father Mac Carty, who wrote the transactions of Ireland for many ages, and was a reputable author, lived in this house; as did Friar Philip O'Sullivan, who wrote Historiæ Catholicæ Hibernicæ Compendium; printed in 1621, 4to. with other works.

Kilcrea signifies the cell of St Cera, whose festivals are celebrated on the 16th of October, and 5th of January, being the days of her birth and death. According to Colgan (Act. Sanct. p. 15), her father's name was Dubh, who was of the race of Cornarius, and monarch of Ireland, about the year 157; from whom descended Carbery Riada, Carbery Bascoin, and Carbery Musc. The first was the founder of the Daileriadan family in Ulster and Scotland; from the 2nd, the sept of the country of Corca Bascoin was derived; and from the youngest, the family of Muskery.

Colgan places an abbey of Austin Nuns at Kilcrea, and says, it was founded in the 6th century by St Cera. But in the records, it is said to be at a place called Grany, now Grange, which is a mile E. of the abbey of Kilcrea, in the parish of St Owens, called the Ovens. Kilcrea is in Desart parish. Colgan places another abbey of Canonesses at Kilcuana, in Muskery, where St Conera was abbess This last place is not now known.

Theseus use when he was obliged to fight the Minotaur in the Cretan labyrinth, which Virgil thus elegantly describes:

Ut quondam creta fertur labyrinthus in alta
Parietibuus textum cæcis iter, ancipitemque
Mille viis habuisse dolum, qua signa sequendi
Falleret indeprensus & irremeabilis error.
Æn. lib. v. v. 585, &c.

And as the Cretan labyrinth of old,
With wandering wave and many a winding fold,
Involv'd the weary feet without redress,
In a round error which deny'd recess.
—Dryden.

This grotto is all lined with a natural gypsum or stalactical matter, which pervades through the rocks, and is a stronger cement than human industry has yet invented. By my computation, I went a quarter of an English mile under ground in this place; and the country people say that it runs to Gill-abbey, near Cork; there is also another entrance near the church to this cave. Grange, near the Ovens, is the house of Mr. Onesiphorus Phaire, whose ancestor, Col. Phaire, was governor of Cork, ann. 1651, being so appointed by Oliver Cromwell. He was one of the persons to whom the warrant for the execution of Charles I. was directed. On the 18th of May, 1660, he was carried prisoner, with a guard of 50 troopers, to Dublin from Cork, and was sent to London, where by the interest of Lord Clancarty (whose life he is said to have saved) as he was going to be executed, by a party, who made him prisoner, and did not know him) he obtained his pardon, and returned to Cork. He was again concerned in the fanatic plot, ann. 1666, for seizing the castle of Dublin and the other garrisons of Ireland, which was discovered by the 1st Earl of Orrery, and Captain Oliver, to the Duke of Ormond, the management of that business in this county being committed to Col. Phaire. However, there being a peace soon after between England, Holland, and France, the plot was dropped, and the projectors of it suffered to go unmolested by the Government. He died peaceably near Cork, and was buried in the anabaptist burying yard of that city.

Cooleroe, the house of Mr. Wetherall, on the S. bank of the Lee, with good plantations, and an handsome avenue leading to the house. Near it is the bridge of Inniscarra, of six stone arches. The river is here contracted, having a fall, and runs with great rapidity. Cooleroe is in the barony of Barrets.

There is no part of Ireland where so much lime is burned as in the S. side of the barony of Muskery. From the head of the vale of Castlemore, down below Kilcrea, on all the adjacent hills, there are great numbers of lime kilns. It is not uncommon to see several on one farm, and some hundreds of them are constantly kept burning all the summer season, being mostly turf kilns, besides some of furze, which are here seldom used. The common labourers in this part of the country will set down their kilns and burn them without the assistance of a mason; in one of them they commonly burn 200 barrels of roch lime, which will make 500 barrels of slack; when it is burned, they take out the lime before it slacks, otherways it would burst the kiln. They also use sea sand for manuring, particularly in the S.E. of this barony, it lying within two miles of the Bandon river, where it is navigable up to Inishannon. Several of the cottagers in this tract pay their rents by lime-burning, and will often sell roch lime, 10 or 15 miles from the kiln, at a shilling the barrel.

CHAP. III.

A Description of the Barony of Kinalea and Kerrycurihy, the Towns of Kinsale, and Bandon, with the adjacent Baronies of Courcies, Ibawne, and Barriroe, and the Cantred of Kilbritton.

The barony of Kinalea and Kerrycurihy (1), the latter called, formerly, Muskery Millane, was possessed by Richard Cogan, and came from him to the Earls of Desmond; it was given by James, the 15th Earl, to his brother Maurice, as I have mentioned before. This country, lying on the S.W. of the channel of Cork, has the convenience of that harbour, and another channel that runs up a lime-stone vale to Carigaline: besides, it has the sea-coast and Oysterhaven to the south, and on the S.W. the bay and harbour of Kinsale; it hath lime-stone for manure, and is sufficiently provided with several kinds of it, drawn from the sea, by means the river Bandon being navigable up to Inishannon.

Monks-town is the nearest parish, in Kerrycurihy, to Cork. The castle was built by the family of Archdeacon, ann. 1638. It is large, and in ruins, and is flanked by four square turrets. To this family also belonged the castle of Barnahely. Ballybritton is a pretty seat in this parish, the gardens lie to the water; it is at present occupied by Mr. Connor. Beyond it is Coolemore, the seat of Thomas Newenham, Esq. More to the south is Crosshaven, a safe creek lying on the W. side after you enter Cork harbour. Sir Francis Drake, in 1589, having a small squadron of five ships of war,, was chased into this harbour by a superior fleet of Spaniards; he ran into Crosshaven, and moored his ships behind the shelter of Corribiny hill, in a safe basin. The Spaniards sailed up the harbour of Cork, and were surprised not to see the ships they had just before chased into it; thus, having missed their prey, they came out again, without doing Sir Francis the least harm.

The castle of Carigaline is situated on the upper end of this haven, on the N. side of the river Oonbouy, built on a limestone rock, by the Cogans, but was many years after possessed by the Desmond family. In Queen Elizabeth's time it was called the impregnable castle of Carigaline (2), but it is now entirely demolished. The parish church is in decent order, and stands a little way to the S., and near it is an handsome house and improvement of Alderman Atkins, of Cork. Shannon Park, alias Ballinrea, was formerly the seat of Francis Lord Viscount Shannon, who had here a neat house and fine park, both entirely gone to ruin; notwithstanding this seat in its time was justly reckoned one of the most pleasant in Munster. The first Earl of Cork designed to build a town at Carigaline; and as it lay nearer the harbour's mouth than the city of Cork, and also had the advantage of a deep and navigable channel, he intended it should rival that city in trade. He was induced to pursue this scheme out of a pique to the citizens of Cork, who entered a bye-law in their council books that no citizen should sell any lands or estate in the city to that nobleman; but the rebellion of 1641 ruined the design. From Shannon park, a rivulet empties itself into a creek, a little to the S. of Monks-town, on the lands of Barnahealy, which works a large bolting mill, erected by the late Mr. Carre, merchant in Cork; and this water is conveyed to it by an aqueduct near a quarter of a mile.

(To be continued.)

(1) Kerrycurihy contains 10 parishes, viz., Templebreedy, the impropriation of Monk's town, Kilmurry, Lisnadeary, part of Carigaline, Kilanully, Ballyneboy, Kilpatrick, Barnehelly, and Riniskiddy, containing 53 plow-lands, and 12,994 Irish plantation acres. Kinalea is divided into 19 parishes, viz., Dunderrow, Leofine, Inishannan, Templemichael, Taxaxon, Brinty, Knockavilly, Ballymartle, Ballynaboy, Knocknamanaghan, Cullen, Bealfoyle, Nohavel, Kilmahonoge, Kilpatrick, part of Carigaline, Kinure, Ballyfeard, and Tracton. It contains 310 plow-lands, in which are 40,088 Irish plantation acres.

(2) The lands of Carigaline, alias Beaver, containing four plow-lands, Ballingay, alias Balinrea, containing six plow-ands, and Crosshaven 80 acres, were demised, by Sir Warham St. Leger (to whom they were granted by Queen Elizabeth) to Stephen Golding, Thomas Petty, and others, who surrendered them to King James I., March 31, 1612. And new letters patent were passed for the same, by Sir Richard Boyle, knt., who purchased them from the said Golding.
MSS. at Lismore.

NATURE'S UNUSED FORCES.

In his Christmas lectures at the Royal Institution Professor Hele-Shaw is dealing with "Locomotion—Past, Present, and Future," and on Saturday afternoon he indulged in some interesting speculations regarding the electric railways of the future, and the possibility of utilising some of the world's water power for the supply of electric current. He prophesied a great future for the "Lightning Mono-Railway," the invention of Mr. F. B. Behr. Electric tramcars were found in every large city of the world. London, having to obey the laws of motion of all ponderous bodies, was moving in the same direction, but was behind many smaller cities. The lecturer then dealt with the sources of power in nature which hitherto had, to a great extent, been untouched. He showed slides of the great Niagara power installation. Here were twenty 5,000 horse-power twin turbines supplying current for various purposes over considerable areas. The horse-power available was some ten millions, but at present only 100,000 was used. The Victoria Falls on the Zambesi were twice as high as Niagara, and twice as much water came over the falls. The available horse-power all the year round was some 35,000,000; yet all this power was running to waste. Some day it would be used to supply electricity, and then electric railways would spread all over Africa. In conclusion, the lecturer reminded his hearers that the great Faraday, who had so often delighted juvenile audiences in that theatre, had been the first to discover the mutual conversion of work and electricity by means of electro-magnetic induction.

ANCIENT INVENTIONS.

Many reputedly "modern conveniences" really antedated the wonderfully inventive nineteenth century. Some wise men say that our most marvellous inventions had been invented long ago, invented and lost, and that the telephone, the phonograph, the electric light, the telescope, the Roentgen ray are at most but rediscoveries. Not only that, but ancient inventiveness is said to have gone so far as to throw modern appliances completely into the shade. Whether this be true is very doubtful, yet the catalogue of "Lost Arts" is certainly a formidable list.

A distinguished Orientalist tells us that the use of microscopes of immense power in ancient Egypt, Persia, and Greece is fairly presumable, because there is a gem shown at Parma, once worn on the finger of Michael Angelo, the engraving whereon is two thousand years old and which reveals the figures of seven women only with the aid of a strong magnifying glass. Sir Henry Rawlinson brought home from Nineveh a stone about twenty inches long and ten inches wide, containing a whole treatise on mathematics that was utterly illegible without a microscope. And if it cannot be found without a microscope, it could not have been engraved without similar aid. Mr. Phillips averred that the art of colouring reached a perfection among the ancients far beyond our own. The burned city of Pompeii was a city of stucco. The exterior of the walls of all its buildings were of stucco, and the stucco was stained with Tyrian purple—the royal colour of antiquity. The city has been buried 1,800 years, yet whenever the walls of one of the houses are dug out, the royal purple flames up to view with a great deal richer hue than any we can produce. Evidently the Pompeians possessed a secret for making fast colours that we have not.

When the English despoiled the summer palace of the Emperor of China they brought home curiously-wrought metal vessels of every kind, and European metal workers confessed their inability to reproduce them. Sheffield steel is an English boast, but it will not bear the atmosphere of India without gilding. Yet the Damascus blades used in the Crusades were not gilded, and they are as bright and keen to-day as they were eight centuries ago. There was one shown at the London Exhibition in 1862, the point of which could be made to touch the hilt, and which could be put into a scabbard like a corkscrew and bent every way without breaking. The best steel in the world to-day does not come from either Europe or America, but from the Punjaub. Sir Walter Scott, in his tales of the Crusaders, describes a meeting between Richard Coeur de Lion and Saladin, in which the English monarch is made to think that Saladin practices the black art because the latter takes an eiderdown pillow from the sofa, and causes it to fal lin two pieces by drawing his keen blade across it. Travellers in India tell of seeing Hindoos throw handfuls of floss silk into the air and cut them in pieces with their fine-edged sabres. There is no steel made in Western workshops of that quality.

So, too, with the art of glass cutting. It was supposed thirty years ago that there were no ancient glass factories, but the Pompeian excavation revealed a workshop full of ground glass, window glass, cut glass, and coloured glass of every variety. We plume ourselves upon our canals, but ancient Palestine had many magnificent canals, with perfectly arranged gates and sluices. It is doubtful if, notwithstandind MacAdam, we build any better roads than the Romans. We have not yet discovered a perfect way of ventilating either our public buildings or our private houses, but the exploration of the pyramids in Egypt show that those Egyptian tombs were ventilated in the most scientific manner.

Our architects are well aware that their ancient predecessors knew some things that are still mysteries to them. Mr. Archibald Dunn, president of the Northern Architectural Association of Great Britain, in an address reprinted in a recent issue of "Architecture and Building," speaks in this sense of the stupendous works of the Egyptian builders of the Nile temples. He says that it almost passes belief that the blocks of granite used in building those wonderful structures could have been handled at all and lifted into their places. For example, many of the stone slabs forming the room of the great Temple of Karnak weigh upwards of fifty tons, and some of them are believed to weigh from one hundred to three hundred tons each. Yet all these huge stones are set without mortar, and to-day, after all the centuries that have passed since they were placed, they are found to be joined with such accuracy that the blade of a penknife cannot be forced between them. Lord Armstrong wrote with wonder and admiration of the great statue of Rameses the Great, which is cut out of a single block of syenite calculated to have weighed 1,300 tons before the artist commenced upon it. He observed that to bring such a block of stone from a distance of 135 miles was a feat which would daunt the courage of a modern engineer, although aided by powers and appliances unknown to the ancient Egyptians." These huge blocks of stone were quarried by means of wooden wedges, which were inserted and afterwards swelled by water, and Lord Armstrong was of opinion that no present day engineer could so detach them.

A distinguished Chinese, asked to admire the speed of train, trolley, and automobile in New York, said: "You will go as fast as you can, and then you will learn to go slowly. We tired of all these things in China thirty centuries ago." Was his speech merely a bit of Oriental braggadocia? Are our "new" inventions really older than our own era?

A LITERARY INSTINCT.

BOOK COLLECTORS AND OTHERS.

The collector's instinct is like genius, in that it is based upon an infinite capacity for taking pains. It is this which has brought much ridicule upon the craft. And, in fact, money values do come to depend upon the infinitely little. At a book sale the other day a first edition (1846) of Hawthorne's "Mosses from an Old Manse" was sold. The book generally is of no great rarity, fetching ten dollars, or thereabouts. But the copy in question was "in the original paper covers as issued," and the fact that no one had taken the pains to bind the two volumes properly was responsible for a price of 170 dollars. In the same sale a first edition of Emerson was commended because its paper label was in perfect condition; a 'crack, a finger-mark, a dog-ear, or a torn corner would notably have lessened the value of the copy. It might be said that these discriminations are often based on reason. One would rather have a clean copy of a book than a soiled, a fair white margin than a page cropped to the head-lines. A margin, too, is a pleasing thing around a print, and early states of a famous etching are often preferable, on artistic grounds, to impressions from the finished plate. But these considerations do not explain sufficiently the startling caprices of collecting values—as the fact that Thackeray first editions, neatly bound, may be had for a song, while the same volume in its original serial parts, with the advertising pages and the ugly yellow-paper covers, may be worth a missionary's ransom; that we pay in banknotes for every centimetre of extra height of a rare Elzevir, and must cover every sixteenth of an inch of margin about a Rembrandt print with gold.

What is really paid for in every instance is simply rarity. The unique copy or impression is the ideal for the enlightened collector; and the anecdote which relates how a famous bibliophile pleaded with an associate for a certain book, raised his offer to an irresistibe price, and then threw the book into the fire with the taunt, "Now my copy is unique," expresses the spirit in which many collections are made. A kind of madness Didbin called it, and yet a madness which is fully justified of its children; for the supply of collectors is unfailing, that of desirable objects ever less. This makes a collection which has been shrewdly assembled with due regard to condition and speculative value one of the very best investments. And it must be said that very little collecting is free from this taint of commercialism. The books in a great private library are usually too valuable to be used, even if the collector, which rarely happens, is a reader also. His prints are of a kind too precious to be framed. his china too good for household use. What is he but, on the one hand, a dealer for probable or possible resale, or, on the other, an irrational idealist in the pursuit not of the beautiful but simply of the rare?

But the anti-social nature of collectors—their neglect of wife and family for the rare example. their disingenuous wiles for catching the unwary dealer or the ignorant owner—have been fully exposed by members of the craft; and since collectors glory in these things, the severe moralist finds their case beyond the power of rebuke to reach or of warning to stay. It should be said, however, that there is a kind of collector who is free from this reproach. Dealers do not favour him, or even admit that he is a collector at all, though they depend largely upon his enthusiasm for their support. He is unknown to the famous salesrooms, but a familiar figure at the bookstalls and smaller shops. This collector buys the books which he loves in the form in which he loves to read them. He buys cheap, and often wastes his money, but he satisfies his soul. His attitude towards books is a sentimental one. He is not wise about margins and labels, or even about editions; but he loves the smell of old Russia; he knows, with Charles Lamb, that Beaumont and Fletcher never taste so good as when taken in folio; or he may have an invincible prejudice against reading Chaucer except in black-letter. He values books for their human associations, for all the homely signs of use, the scribbled "valde absurdum est" on a margin, or the signature of a former owner which defaces a title-page.

Only this kind of collector, after all, knows the real luxury of possession. His books, when he is beyond using them, may cut but a sorry figure in the salesroom, and his heirs and assigns may resent the thriftlessness which was willing to amass such merely personal treasures as are negotiable only at an appalling discount; but he himself should have the pardon of him who has loved greatly. We should not fail to admire the minute special knowledge, the painstaking sagacity, and the fanaticism in the quest exhibited by the great collectors of whom history takes account. But we do well, also, to praise the obscure and disinterested collector who loves his possessions for their own sake; and we may well suspect a definition so rigorous as to exclude from the line of collectors Charles Lamb, who loved old books with a kind of passion, and Sir Walter Scott, who made Rhbotsford a veritable museum of objects which, apart from their personal associations, were of pitifully slight value.

THOMAS O'CONNELLAN, POET & HARPER —DIED, 1700.

Chief of the Bards, whose strains still wake
To living ecstacy the Celtic mind,
Entombed thou liest by that enchanted lake,
Where echo has so oft thy numbers joined,
At evening's close, when dewy hills and rocks
would take
The melting cadence and prolong the sound,
And fill the air, until the throbbing wire
Waked tones æolian like the fairy choir.

The Desmond Hall, where oft thy pœans rung,
Is near thy grave, a mouldering heap,
And those who raptured, on thy harping hung,
Are here joined with thee in their lowly sleep.
All changed, forgotten, those; but still thy song
Is fresh and beautiful. The numbers keep
Ready for fingers deft to thrill the golden string,
And freedom's efforts proudly praise and sing.

Meet for a Bard, thy tomb is crowned
With wreathed ivy, and the hawthorn spray
Sighs luscious perfume on the hallowed mound,
Where warbling at decline of day,
The wild birds' melodies resound.
Pale o'er the lake the moon unfolds her ray,
Beams on the water a long, silvery path,
From Leaba-mûice to Bantee's mystic rath.

Hushed is thy harp; but not its magic power,
Like to its trembling strings are those bright
waves,
Which night winds bring all singing to the shore,
To fall on pearly sands, soft as rose leaves,
Or in wild tumult surging roar,
Gair's weird response when Eire's bosom heaves
In lofty diapason as a valiant part,
Thrilled through fingers from a minstrel's heart.

—E. B. F.

Lough Gur, in county Limerick, lies within a few miles of The Bruff, as the name signifies, it is the lake of enchantment. Around the lake are many Druidical monuments, stone circles, pillar stones, raths, and there are two picturesque old castles. Tradition says the lake heaves and roars tumultuously when ever any eventful matter convulses Erin. Bantee's rath is the favourite seat of the Banshee. Leaba-na-mince is a Druid's weird grave, near the minstrel's tomb.

15th January, 1903.

E. B. F.

LITERARY NOTES.

In view of the fact that certain lives of the late Lord Dufferin have been announced for publication, the "Athenæum" is desired to state that the only biography authorised by his family is that which is now being prepared by Sir Alfred Lyall.

◇ ◇ ◇

It is probable, we believe, that this year Mr. Andrew Lang will pay a long-contemplated visit to the United States, and may travel as far as Samoa in order to form acquaintance with the exile-home and haunts of his old-time friend Stevenson. Mr. Lang will finish the third and concluding volume of his History of Scotland this year, when, it is said, he will begin the preparation of a complete edition of his works.

◇ ◇ ◇

Mr. Ernest A. Vizetelly has now completed the English translation of M. Zola's last work, "Truth," which will be issued in a variety of languages about the middle of February next. It wil be found that M. Zola's last book is also his longest. The English version makes a volume of nearly 600 pages. Messrs. Chatto will issue it in England, and Mr. John Lane in the United States.

◇ ◇ ◇

We hope, remarks a contemporary, that Mr. Inderwick may yet find time to give us not a few more contributions to literature. As a busy man at the Bar he has contrived to find leisure to issue several extremely interesting works; we trust the duties of his new post may not prevent him from adding to his list. For a considerable time he has acted as Chairman of the Committee of the Bar Library, a position in which his literary sympathies have been found extremely valuable.

◇ ◇ ◇

A correspondent of the "Author" suggests that publishers should provide means by which a book-buyer might see a volume which he feels disposed to buy before making a definite purchase. His idea is that books might be collected in some central shop, and a fee charged for examination. But we hardly think (the "Academy" remarks) such a scheme would work. After all, the majority of serious book-buyers know perfectly well what they want. And do not certain publishers already undertake to send on approval, through the nearest book-seller, any volume appearing in their catalogues?

◇ ◇ ◇

The new Archbishop of Canterbury has not been a very voluminous writer, and it is hardly likely that the high duties that will now be cast upon him will leave him much leisure for letters. He is best known, of course, from the point of view of literature by the Life of his father-in-law, Archbishop Tait—about whom, by the way, we came across an amusing anecdote the other day. It was when he was appointed Headmaster of Rugby. A small Scottish laird hearing of this, and knowing the family, exclaimed with a groan, "What! Crauford Tait's son made a dominie! Eh, sirs, that I should have lived to see it!" It reminds us of old Boswell's sneer at Johnson keeping a "schule" and "calling it an acawdemy"!

◇ ◇ ◇

"Harper's Magazine" publishes this month an article on "The Coinage of Words," by Professor Kittredge, of Harvard. Professor Kittredge devotes most of his space to discussing new compounds and the possibilities of the suffix; only at the end does he touch upon the "boldest kind of word-coinage—that in which the new term appears to be made by a single act of creative instinct, without regard to precedent." Professor Kittredge continues —"It is a difficult categoy to discuss; for the history of such terms is seldom ascertainable, and we are in danger of referring to this lawless group a number of well-behaved formations which sprang from obscure or forgotten analogy. One theory, however, is certain. The words that we are here contemplating are the product of language-makers who stood in no awe of the dictionary." Of such words Professor Kittredge gives very few examples, the best being Lewis Carroll's "chortle." "It suggested," he says, "the gurgle of senile exultation." But words of that kind hardly come into the general question of word-coinage; they are "sports," and never come into really literary English.

◇ ◇ ◇

The current number of the "Monthly Review" prints some anonymous satirical verse called "Le Byron de nos Jours, or the English Bar and Cross Reviewers." It is a piece of excellent fooling; light, terse, and neatly turned. We quote the opening lines:

Still must I hear?—while Austin prints his verse
And Satan's sorrows fill Corelli's purse,
Must I not write lest haply some K.C.
To flatter Tennyson should sneer at me?
Or must the Angels of the Darker Ink
No longer tell the public what to think—
Must lectures and reviewing all be stayed
Until they're licensed by the Board of Trade?
Prepare for rhyme—I'll risk it—bite or bark
I'll stop the press for neither Gosse nor Clarke.

◇ ◇ ◇

That Dickens might have had many originals of Squeers may be proved by a story related to the Devonshire Association at Ashburton some years ago by the Rev. S. G. Harris, Vicar of Highweek. Mr. Harris told how as a boy he was sent to an Ashburton school, which bore a considerable likeness to Dotheboys Hall. "I remember the master chuckling over 'Nicholas Nickleby,' which was then (about the year 1837) coming out in numbers; but it was only the outside which we were permitted to see. On one occasion the master's wife took the boys to hear a public lecture, when the lecturer, with some amount of rudeness, burst into a fit of laughter, and then apologised, on the ground that the school before him so much reminded him of Mr. Squeers's academy. I could not for a long time understand why we were fed perpetually with fried potatoes (though with little of goodness added to them) for breakfast, until I realised that potatoes were then about 1s 6d per bag."

◇ ◇ ◇

As to the identity of Mr. Wackford Squeers, an Eastbourne correspondent sends us, says the "Daily Chronicle," a newspaper cutting from his grandfather's scrap-book, compiled between 1830 and 1840. The advertisement sets forth how "at Mr. Ralph Simpson's Academy, Newsham Hall, near Greta Bridge, Yorkshire," youths are instructed "at twenty guineas a year, including clothes, books, and other necessaries." Here is a significant addition. "There are no extras or vacations," and "Mr. Simpson pays strict attention to the moral and religious improvement of his pupils." But it would be unfair to regard Mr. Simpson, or any other individual, as the original Squeers. In his preface to the "Charles Dickens" edition, Dickens mentions (we are quoting from memory) that many Yorkshire schoolmasters resented their own likeness, but assures his readers that no particular schoolmaster sat for the picture.

◇ ◇ ◇

Reviewing the fiction of the year in the "New York American," Mr. Harry Thurston Peck takes no cheerful view of the future of the novel as the vehicle of ideas—"Looking back upon the year that is now ending, its literary record is noticeable from the fact that no single novel has attained a phenomenal success. Many have reached sales which would once have been thought remarkable, yet which are so no longer. More novels are being written than ever, and probably more are being read; yet they do not attract the attention given to them a few years ago. Why is this? I think it is because the novel is once more sinking to its normal place—the place it occupied before, with Dickens, it began to usurp a field which cannot be permanently its own. It will hereafter remain simply a source of pleasure and of amusement. It is not going any longer to be accepted as a means of preaching political, social, and economic doctrines. It is bound to revert to what it was when Fielding wrote, when Richardson wrote, when Scott wrote—mere literature."

◇ ◇ ◇

Continuing, Mr. Peck writes—"The nineteenth century saw the apotheosis of fiction. Fiction could then get a hearing when argument and persuasion in less attractive forms were utterly unheeded. Dickens used it to blot out the workhouses and the Yorkshire schools. Charles Reade reformed the lunacy laws of England by a single novel. Disraeli smoothed the way for political changes in his works of fiction. In this country, Mrs. Stowe perceptibly hastened an inevitable war by her one great book. Edward Bellamy in the pages of 'Looking Backward' raised socialism from the slums and made it popular in the drawing room and the halls of the university. In France, Emile Zola attempted to demonstrate by works of pure imagination the solutions of all sorts of problems—ethical, physiological, and psychological. Fiction to him was an exact science, an instrument of precision; and men listened to his claims with serious attention. We have gone beyond this stage at last. The twentieth century will not be a century of novel-reading. Fiction has done its work. It has won a hearing for many causes. It has created or excited an intelligent interest in all sorts of problems and conditions. Yet it cannot solve these problems nor alter those conditions; and so it must give way to other forms of literature that bear directly on them both. So long as there are young men and women who love and marry, so long as the spirit which seeks adventure still exists, for just so long will novels and romances find eager readers. Yet the world, grown wiser, will go to life itself and to the records of life for serious instruction; and it will not accept the novelist as a teacher or a demonstrator.

◇ ◇ ◇

We announced some time ago (says the "Academy") that a Life of Lord Beaconsfield was being written by a man of letters who has made a life-long study of his fascinating subject. This Life, which is to be in two volumes, is already well advanced, and will certainly be published this year. In the meantime the much discussed question of Lord Rowton's silence on the subject has been revived by the "Morning Advertiser." That journal prints the passages from Lord Beaconsfield's will which bear upon documents and their custody, and draws the conclusion that it is clear that "Lord Beaconsfield did not intend the Life to appear for many years after his death," and that "the King's consent would have to be obtained before the correspondence with Queen Victoria could be published." In an admirable leader upon the subject the writer says:—"Twenty-four years have passed since Lord Beaconsfield set his name to the document, and twenty-one years since he died. In the absence of an authorised life, the loss of which we naturally deplore, the name of Benjamin Disraeli tends to become the centre of a myth rather than the label of an individuality. He lives—and possibly he may have desired to live—as a memory, as the expression of an idea. Was it the exquisite cunning of his statesmanship which framed a will so binding and so exacting as to make the revelation of his real self almost impossible, even twenty years after his death?" So far as the personal documents and correspondence in Lord Beaconsfield's possession at the time of his death are concerned, the discretion of publication is entirely in the hands of Lord Rowton; but we believe that in the case of many of them access has not been refused. At any rate there is ample material for a Life which shall hurt no susceptibilities and yet be reasonably full.

SCIENTIFIC TOPICS.

It has been found that when photographic dry plates are cut with a diamond on the side opposite the film, and then developed, the film turns dark along the edge of the plate to the breadth of a few millimeters. The film always develops first on the side next the glass. This effect has been traced to a momentary fluorescence along the line traced by the diamond, the radiation penetrating the plate.

✧ ✧ ✧

Professor Exner, founder and director of the Technological Museum of Vienna, recently declared that the five million technical experts of all grades throughout the world had too small a share in law making and the administration of the various States. He maintained that technical knowledge was of such importance as to warant the creation of politically independent technical departments in every country.

✧ ✧ ✧

A series of experiments has been made by Schaible to determine the effect of diminished air-pressure on the growth and germination of plants. The apparatus used is fully described and illustrated, and details of numerous experiments are given. The results arrived at were that, as compared with similar plants grown under normal barometric pressure, those under the diminished pressure—in most cases about one-quarter atmospheric pressure was employed—(1) grow more rapidly; (2) germinate more slowly; and (3) execrate drops of water from their leaf surface.

✧ ✧ ✧

During the progress of some excavations in Alexandria, Egypt, the workmen came across several huge block of masonry, some as much as three yards square. The remans of the entablature of a large edifice, which probably consisted of two stories, were also found. Some of the blocks bear quarry marks difficult to decipher. These masonry blocks, which have been examined by experts on the spot, are believed to be the ruins of the ancient theatre of Alexandria described by Strabo. The discoveries are to be carefully investigated by expert Egyptologists to ascertain their exact origin and the era to which they belong.

✧ ✧ ✧

The formation of the gold fields of South Africa is peculiar. The gold is in reefs. According to the "Mining and Scientific Press," these reefs are massive and made up of coarse granite conglomerate and sandstone, with here and there large or small cement seams. The gold is not in the quartz or sandstone, but in the cement. The streaks which carry the gold are from 6 inches to 60 feet in width, and almost invariably widen with depth. When the outcropping is first discovered it looks like a vertical vein, but soon flattens out on depth. The mining there is more like coal than gold mining anywhere else. Shafts are nearly all 16 x 8 or 16 x 6.

✧ ✧ ✧

Some interesting experiments in the interest of science have recently been undertaken at the Turin Physiological Institute, with the object of ascertaining the proportion of carbonic oxide necessary in the air to destroy human life. Signor Teodoros Scribante, of Turin, placed himself unreservedly in the hands of Professor Mosse for the purpose of the investigation. On three successive occasions Signor Scribante was confined in a hermetically-sealed iron chamber, the air of which was mixed first with 1-333 of carbonic acid, then with 1-285, and lastly with 1-233. At the third experiment the courageous patient was found to be in a cataleptic state, from which he was only restored by means of oxygen.

✧ ✧ ✧

Some two years ago, while tending the roots of the vines in a vineyard at Attenburg, Lower Austria, a gardener unearthed the lower jaws and upper molars of a gigantic animal, presumably a rhinoceros, which were taken to the high school at Vienna for further investigation. Prof. Toula closely examined the relics, and recognised from the structure of the teeth that the remains were not those of the ordinary wooly rhinoceros. He immediately repaired to the vineyard, where he continued excavations at the point where the skull was disinterred, and discovered practically the whole of the skeleton of the interesting animal, which has now been mounted. Although a portion of the skull is missing, there is sufficient to show that the beast was of the two-horned species found in Sumatra. The breccia where the skeleton was found is of the Pleistocene age. It also contained the remains of a goat.

✧ ✧ ✧

The city of Bombay, India, is to be equipped with an extensive system of electric traction and lighting, while another scheme for operating a stretch of railroad is to be carried out. Water is to generate the necessary power for both projects. For these purposes two huge water-power plants are to be constructed. The machinery for supplying the electricity to work the railroad is to be installed on the Doodh Sagar River, about 300 miles north of Bombay, at a waterfall which is about 2,500 feet in height. It is anticipated that with the projected machinery for this installation 50,000 horse-power will be generated—available throughout the year—sufficient to operate some sixty miles of track. The power for lighting and working the street railroads of Bombay is to be transmitted from Neral, about forty miles distant from the city.

✧ ✧ ✧

A comprehensive scheme of electric traction is to be installed upon the roads of the foreign settlement of Shanghai. Competition for the construction contract was very keen, but the order for the equipment has been placed with two English houses. Work is to be commenced immediately. The present contract comprises the construction of nine and a half miles of double track, and eight miles of single track, the necessary equipment and cars. The work is to be completed by the end of 1904, and the cost is estimated at 3,500,000 dollars. The Shanghai Municipal Council reserves the right to take over the roads at the end of twenty-one years on specified terms.

✧ ✧ ✧

A system of electric heaing has been adopted in the cars of the electric railway to Versailles. In each car of the central corridor class, ten heaters are placed on the floor between the seats,so that they act as foot-warmers. The heaters are of the Parvillee type, in which the resistance consists of a mixture of metallic powder, quartz, kaolin, and a flux, and are connected five in series—being supplied from the third rail at 550 to 600 volts. At 110 volts each takes one ampere, and the total power for each carriage, which seats forty passengers, is therefore 1,100 watts. Assuming a cost of 15 centimes per kilowatt hour, it follows that the expense of sixteen hours will be 2.64 francs. The mean temperature obtained at the surface of the heaters is 70 deg. when the external temperature is 0 deg.

✧ ✧ ✧

A. Kinkelmann states that as a result of his experiments on the diffusion of hydrogen with platinum, he finds that the rate of diffusion increases after the platinum has been treated for some time. It is proved that this is not due to expulsion of occluded air, but to the crystalline structure assumed by the metal. When the platinum has passed into this state, it persists therein. The diffusion of hydrogen through red-hot platinum is not proportional to the pressure of the gas, but it is probable that the diffusion is accompanied by a dissociation of the molecules, and only the atoms of hydrogen pass through metal. The results agree with the formula obtained in previous experiments. The present experiments were made with a platinum tube 19 cm. long, 1 mm. in diameter, and 0.1 mm. thick in the walls. The metal was heated electrically.

✧ ✧ ✧

Electric traction is especially active in Italy at the present time. One of the most important electric railroads, the Milan-Varese system, has recently completed an important branch from Varese to Porto Cerisio, and the tests which have been made on the line from Gallarete to the last named point proved quite satisfactory. The grades are considerable over the new branch, and in many places reach as high as 20 per cent. The electric locomotives however have no difficulty in making the trip at a speed of 35 miles an hour, which could not be reached before by the steam locomotives. The train makes the run from Porto Ceriso to Varese, or 8.4 miles in 17 minutes in spite of the grades and sharp curves. The Milan system, which has already been described, contains a line from Milan to Gallarete, 24 miles, and from this point all three branches to Porto Ceriso, Laveno, and Arona, of 20, 15.6, and 18.6 miles respectively. Trains have been running from Milan as far as Varese, or 35.4 miles, for some time past, but it is only recently that the line has been extended to Porto Ceriso, 8.4 miles, making the total distance 43.8 miles.

✧ ✧ ✧

Prof. A. L. Rotch, of the Blue Hill Meteorological Observatory, intends to explore the upper regions of the air above the equator by means of kites and balloons sent up from ocean steamers. In this manner Prof. Rotch hopes to study the overlying and anti-trade winds and to make a map of their course. It is only on the peak of Teneriffe that the anti-trade winds can be observed the whole year. Their mean lower limit is at the height of 9,000 feet, and their height is greater in summer than in winter. In October this altitude sinks to 6.000 feet. We know that the anti-trade exists over the trades, at least in the North Atlantic and at the Sandwich Islands, but no one has found this upper current in Central America or in Ecuator, while the smoke of the highest volcanoes around Quito constantly indicates a strong wind from the east. It remains to be seen whether kites or balloons sent up from ocean-going steamers will add something to our very limited knowledge of the anti-trades.

✧ ✧ ✧

At the recent annual congress of the Swiss Society of Natural Sciences, held at Berne, a new and interesting theory as to the origin of the appearance of the higher atmosphere, which is popularly styled as the "blue sky," was advanced by M. Spring, a well-known scientist of Liege. Hitherto the azure tint has been supposed to be due to the refraction of light upon minute corpuscles disseminated in the air. M. Spring, however, has conceived a new explanation of the phenomenon. He has carried out a number of experiments with luminous rays under almost all conceivable conditions, injecting them into agitated solutions, and into a glass tube, containing pseudo solutions such as chloride of aluminium of absolute limpidity; but although he could obtain red, yellow, violet, etc., under no circumstances could he obtain blue, until by the use of electricity he secured a perfectly pure atmosphere in which blue was clearly discernible. M. Spring, therefore, concludes that the blue of the sky is purely electrical in origin, and is an essential quality of the air.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

CORK, SEPTEMBER 6TH, 1787.

Within these few weeks a commission was received here from America for the purchase of osnaburghs to a very considerable amount; but could not be executed, as the establishment of that manufacture in this kingdom had been prevented by a combination of the linen weavers.

TUESDAY, SEPTEMBER 11TH.

Yesterday a Post Assembly was specially held by the Lord Mayor, Aldermen, Sheriffs and Commons of this city, at the Tholsel, to take into consideration a grant of a certain sum of money for the purpose of better supplying the metropolis with water, and for erecting many additional fountains, that the poor may have no reason to complain of the want of that necessary article of life. The Sheriffs and Commons came to a resolution purporting that they were ready to agree to any reasonable mode with the Commissioners for paving, lighting, etc., for that purpose, and that the business be referred to the pipe-water committee for their investigation and report.

We hear the vaults at the Rotunda and Newrooms have been purchased from the Governors of the Lying-in-Hospital for ever, by an eminent wine merchant in this city.

A few days ago Mr. Peter Wilson, formerly an eminent bookseller in this city, overseeing a number of labourers employed in digging a piece of waste ground, near his residence at Killiney, in the Co. Dublin, discovered several stone coffins, and the remains of a Druidical temple. This gentleman has communicated the discovery to Col. Vallancey and several other antiquarians, who intend to assemble there for the purpose of examining this piece of antiquity.

We are authorised to assure the public that an advertisement which was industriously circulated, importing, that the redundancy over nine pence was to be refunded to such porters and messengers as had taken out badges, was a spurious one, and that on the contrary, the Commissioners of Police are determined to put the law in force against any porter or messenger who ply for hire without a badge or licence for which such porter or messenger is by an old Act of Parliament obliged to pay five shillings; neither is it in the power of the Commissioners to dispense with the payment of it, as it is appropriated to the purposes of the Act.

A model for a Canal Lock of a very valuable and curious construction has lately been presented to the Company of Undertakers of the Grand Canal by an artist in this city, having among some other improvements on the old locks the following remarkable ones:

1. That of raising or falling a boat from a level of sixty feet by a single lock.

2. That of obviating, by a single contrivance, the waste of water, for at the passage of any boat through it, more than nine-tenths of the water will be retained for the next occasion; so that this useful Lock will not require a sixth part of the water now expended in the smallest lock in the navigation.

The model is now in complete order at the Navigation House, and was particularly intended by the inventor to answer the great fall from the level of the Canal at James's street to the river Liffey; an object not fully determined upon by the Company, which Company has, however, as a token of its approbation of so very ingenious a contrivance presented the inventor with twenty guineas, and should his plan be ever executed by them, there is no doubt but he will be rewarded according to his merit.

WEDNESDAY, SEPTEMBER 12TH.

By the last accounts from the Vicregal excursion, we find that his Grace the Duke of Rutland has continued his tour through Connaught, and is at present at Belleek, in the county Mayo, the seat of the Right Hon. Henry King, where he is experiencing the pleasures of social life, and true Irish hospitality.

From the county of Mayo we hear his Grace proceeds to visit the counties of Leitrim, Sligo, and Roscommon; from thence to Longford, and thence returns to Dublin in a straight line, stopping only a few days at Portlemon, in the county of Westmeath, the seat of the Right Hon. Sir John Blaquier. The principal place that will attract his Grace's notice to the circuit are—Haslewood, in the county of Sligo, the seat of the Right Hon. Owen Wynne, and the Earl of Kingston's residence, near Boyle, in the county of Roscommon. Than the former place, Haslewood, it would be difficult for the most fertile imagination to picture one more beautiful. It presents to the eye a variety of natural and artificial beauties, and is nearly insulated by an extensive lake through which islands are scattered, clothed with wood. Kingston House is also worthy of notice, but the improvements are vastly superior to what they were some years since.

The additional buildings at the Yarn-hall are nearly completed. They form two entire new squares, and will afford a convenience of accommodation to persons who deal in the staple manufacture of the kingdom, which was very much wanted. The rooms formerly occupied were by no means adequate to the purpose, and thenecessity of these buildings was, of course, indispensable, particularly when it is reflected that this branch of our trade is daily increasing.

We are glad to have it in our power to inform the public from the best authority, that it is determined on to preserve an uniformity in the wings of the Parliament House.

The great utility of the Belfast Bank begins to be experienced, not only by all the traders of the North, but even in this city, and every trading part of the kingdom where these notes (being payable in Dublin) all circulate as cash, which is a most pleasing circumstance. Formerly the linen merchants were put to the great inconvenience of carrying down the specie, which was disagreeable, besides the risk of being robbed of it on the road, but they now can procure notes for the cash in Dublin, which they are sure of receiving the specie for whenever they choose to send to the Bank in Belfast.

THURSDAY, SEPTEMBER 13TH, 1787.

The Soldiers Infirmary in the Phoenix Park is carrying on with the greatest rapidity, and when finished will be a most complete building, simply elegant, and well adapted for the purpose.

Within these two days have been erecting on the centre of the North front of the New Custom House, four Colossal statues emblamatic of Europe, Asia, Africa, and America, executed in Portland stone by Banks of London, from which place they were imported a few months since.

Extract of a letter from Castlebar, Sept. 10th—"On Friday last his Grace the Duke of Rutland arrived here, and was received by a vast concourse of people, who lined the roads and welcomed his approach with shouts and acclamations of joy. At the entrance of the town he was met by the magistrates and corporation, who attended him to the Castle, where they had the honour of presenting him with a very dutiful and loyal address, accompanied with the freedom of Castlebar, enclosed in a gold box, ornamented with the arms of the corporation, and an inscription expressive on the occasion. They had afterwards the honour of dining with his Grace.

"In the evening the town was illuminated throughout. Bonfires blazed in all the streets —the cannon at the Castle hill fired; and the army being drawn out, gave a feu de joye.

"The next day his Grace visited more particularly every part of the town and its environs, and declared his satisfaction and surprise at beholding the great market of linen, and also the market of corn and every kind of provisions with which the town is blessed in the greatest abundance."

Tuesday night some citizens returning into town in a hackney carriage, from being on a party of pleasure, were stopped near Chapelizod by six armed footpads, who surrounded the carriage, and robbed the company of two guineas and a half in gold, and seven shillings in silver, with which they got clear off. One of the fellows fired a shot at the coachman, but it fortunately missed him.

History does not furnish us with an instance of a kingdom arriving at such perfection in arts, sciences, and commerce, within a period of thirty years, equal to that of our native country. 'Tis not more than forty since our manufactures and the necessaries of life were brought to the metropolis on pack horses. No such thing is now to be seen, and by means of general roads throughout the kingdom, correspondence is rendered quite facile, the people civilised, and the spirit of trade and enterprise pervading from the extremities to the very centre of the nation. Our seaports are crowded with vessels, insomuch that there were twenty-seven discharging at our Custom House last Monday, our external exports greater than at any former period, and our commerce extended to the most distant parts of the globe.

That our staple commodity, linen, has trebled in increase within a few years no one can deny. In the memory of numbers living, the yarn and linen business was transacted in a few obscure inns in Thomas street, but now we see a most sumptuous pile of buildings adapted to and fully occupied by that trade, which is an incredible source of wealth to the kingdom, and which, under the auspices of the present Governors of the Linen Board, we doubt not will be brought to such a degree of perfection as to gain a preference in, and to bid defiance to, the manufacture of any other quarter of the world.

Yesterday Mr. Sheriff Thompson visited the Liberty and its vicinity, and in his perambulation seized a large quantity of bread which was considerably deficient in weight, which he distributed to persons in the following manner:

5 loaves to St. Sepulchre's Marshalsea, 24 ditto to the Four Courts ditto. 31 ditto to the City ditto, 17 ditto to the widows of St. Catherine's Almshouse, 8 ditto to St. Michan's ditto, 12 ditto to the Dissenters, Dolphin's Barn ditto.

FRIDAY, SEPTEMBER 14TH.

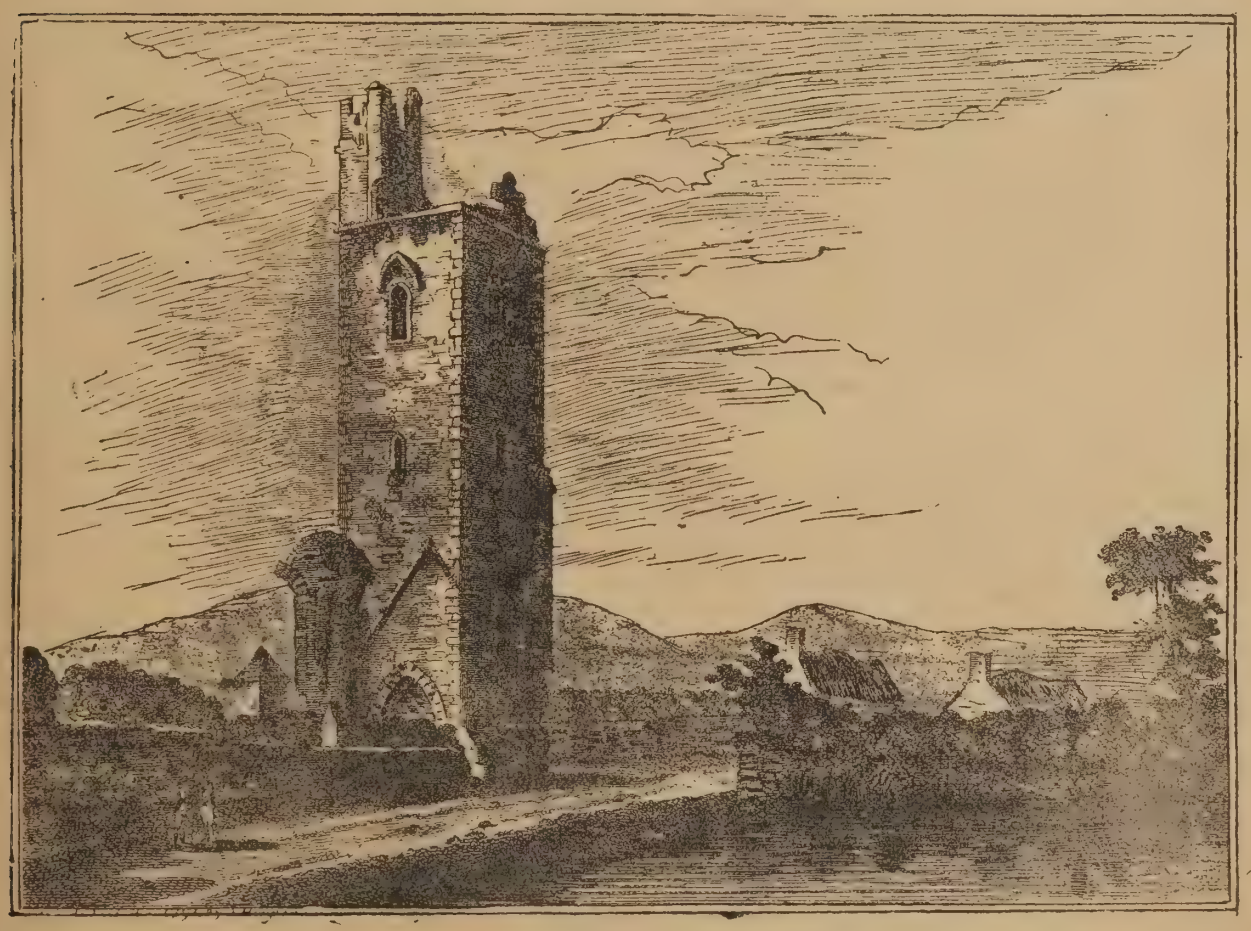
Very considerable preparations, we are informed, are making on the south-west coasts of this kingdom for the pursuit of the herring fishery in the approaching season, by spirited individuals, and one company, we hear, has been formed near Newport-prat, Co. Mayo, with a capital of about £3,000. This sum, though comparatively small compared to the capitals of our neighbours, will afford employment to numbers, and be sufficient for every purpose of tackle, curing, etc. Of all other pursuits this is the most lucrative, and our coasts have been very justly compared to a mine, which the more it is worked, the more it produces.

RATES OF SUBSCRIPTION.

"DUBLIN PENNY JOURNAL."

Post free to any part of Ireland, Great Britain, Australia, New Zealand, Canada, United States.

Twelve months, 6s 6d; Six months, 3s 3d; Three months 1s 8d.



Printed and published for the proprietors at 90 Middle Abbey street, Dublin, by W. F. Dennehy, to whom all cheques and money orders should be made payable.

Vol. I., No. 44. DUBLIN, SATURDAY, JANUARY 31, 1903. PRICE ONE PENNY.

THE GRAY FRIARY, DUNDALK.

FROM A VIEW BY FRANCIS GROSE, 1770.

Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

DUNDALK, a seaport, market and post-town, and parish, in the barony of Upper Dundalk, county of Louth, and province of Leinster, 10¼ miles (S.) from Newry, and 40 miles (N. by W.) from Dublin, on the mail road to Belfast; containing 14,300 inhabitants, of which number 10,078 are in the borough and liberties. The earliest historical notice of this place occurs in 1180, when John de Courcey with 11,000, marching against a prince of Argial who had destroyed one of his ships, was encountered by the native chiefs with a force of 7,000 men, by whom he was defeated with the loss of 400 of his troops. The English power being soon afterwards firmly established, Dundalk with some other territories were granted to Bertram de Verdon, who founded here a priory for Crouched Friars of the Augustine Order, which afterwards became an hospital; and in the reign of Hen. III., Lord John de Verdon founded a Franciscan friary in the town. In 1315, Edward Bruce took possession of the town, and caused himself to be proclaimed King of Ireland. He maintained his assumed dignity here for

nearly a whole year; but being attacked by John de Birmingham, his army was totally defeated and himself slain. Some time after, O'Hanlon, an Irish chieftain, came with a large force to demand tribute from the inhabitants, by whom he was so vigorously repulsed that 200 of his men were left dead on the field. In 1338, Theobald de Verdon obtained a grant of a market and fair for 15 days. Rich. II. confirmed by charter all the privileges the inhabitants had previously enjoyed, and made the town a free borough; and Hen. IV. granted the bailiffs and commonalty certain customs, to surround their town with walls, which, from its exposed situation on the north of the English pale, were necessary for its protection. In 1558, the Lord Deputy Sidney appointed an interview with the powerful chieftain Shane O'Nial, who at last agreed to come to him here on condition of being received as his "gossip." The town was, in 1650, besieged by the O'Nials, but was so valiantly defended that they abandoned the design. A subsequent attempt was made, with no better success; and in 1562, the Earl of Sussex, Lord Deputy, sent some forces to the assistance of the townsmen, between whom and Shane O'Nial a mutual restitution of plunder took place. So great was the power of the native chieftains in 1596, that in a conference held at Faughart it was proposed by the English Government to make this town the frontier of their dominions in Ireland; but all overtures for a pacification were rejected. On the breaking out of the war in 1641, Roger Moore and Brian MacMahon posted themselves near this town, of which they held possession, with a force of 2,500 men, and bade defiance to the Irish Government; but Sir Henry Tichborne assaulted, and, after an obstinate resistance, succeeded in gaining possession of the town. Col. Monk, who had been appointed Governor, was, in 1649, compelled by Lord Inchiquin to surrender it to Cromwell. In the war of the revolution, some forces of Jas. II., which had been stationed in the town, abandoned it on the approach of William's army, commanded by Duke Schomberg, who encamped his forces on some low, marshy ground, about a mile to the north, where they suffered much from disease. James detached a party to seize the pass at Newry, which, on the first appearance of opposition, retired to Sligo. He soon after advanced at the head of the Irish army, and drew up in order of battle, but just at the moment when an engagement was expected, drew off his troops and retired to Ardee.

The town is situated on the south side of the Castletown river, which suddenly expands as it opens into the bay of Dundalk; and consists of two principal streets, each about a mile in length, intersecting each other in the market square, and of several smaller streets. The harbour is formed by the innermost recesses of the bay, which is seven miles across at its mouth from Dunany Point to Cooley Point, and extends nearly the same distance to the town. It is very safe, and the bay affords good anchorage in from four to eight fathoms of water.

Since the confirmation of its privileges by Rich. II., the town has received various charters from succeeding sovereigns; it is now governed by that of Chas. II. The borough first returned members to Parliament in 1374, and continued to send two to the Irish Parliament till the Union. There are some remains of the Franciscan friary on the east side of the town, consisting of the tower, a lofty square pile surmounted by a slender turret commanding an extensive prospect. After the dissolution it was granted by Hen. VIII. to James Brandon, at a rent of sixpence per annum, and a renewal fine of £9 10s. Of the religious establishment founded by Bertram de Verdon, there are no remains; its revenues were granted by Elizabeth to Henry Draycot, who had previously obtained a lease for 21 years. Near the town is a spring, arched over with ancient massive masonry, called the Lady Well, and much resorted to on the patron day, Sept. 29th. On the plains of Ballynahatna are the remains of a Druidical temple partly enclosed by a curving rampart, on the outside of which is part of a circle of upright stones; and on a rising ground near this place is a circular fort surrounded by a double fosse and rampart, supposed to have been thrown up by the earliest inhabitants of the country. Dundalk formerly gave the title of Baron to the family of Georges.

Grose, in his "Antiquities of Ireland," 1791, says:—There were two monastic foundations here, one for cross-bearers, which Bertram de Verdun, Lord of the town, erected about the end of Henry II.'s reign; they followed the rule of St. Austin, and their patron was St. Leonard. This was also converted into an hospital.

The other was the Gray-friary, which was built at the east end of the town in the reign of Henry III. by Lord John de Verdun, the east window of which was admired for its curious and elegant workmanship. The tower given in the plate is part of this building. It is a square battlemented steeple in good repair. In the west side is a Gothic window, over which is a projecting stone cut into a grotesque head. The terminations of the arch of the window are similarly ornamented. The prospect around is fine and extensive.

LOVES THAT ARE GONE.

BY HERCULES ELLIS.

Grief follows gladness,
And blends its dark charms;
Mirth springs, from sadness,
As rainbows, from storms;
All things are dying,
Or flying, or flown;
How vain, then, is sighing
O'er loves that are gone.

If, falsely, they've left thee,
They're not worth a sigh;
If death hath bereft thee,
'Tis man's lot to die:
All things are dying,
Or flying, or flown;
How vain, then, is sighing
O'er loves that are gone.

CELEBRITIES WHO LOVED A SMOKE.

The famous writer, Thomas Carlyle, was rarely seen without a clay pipe between his teeth, and one of his most famous literary panegyrics is devoted to the delights of "Lady Nicotine." Victor Hugo was also a passionate lover of tobacco, and paid fabulous prices for his cigars.

Guizot, the French historian, considered that it was tobacco which lengthened his life to an inordinate degree; whilst Charles Kingsley, the author of "Westward Ho!" was unable to compose a single line of his work until a cigar was firmly set between his lips. Robert Burns was a persistent smoker, and would sometimes consume 1lb of tobacco per week.

The late Lord Tennyson, when being asked how he had enjoyed a Continental tour, confessed that he had disliked Venice because "they had no good cigars in the town," but towards the latter portion of his career the Laureate abandoned cigars in favour of clay pipes, made especially for his own use.

Prince Bismarck was an inveterate cigar smoker, but that his good-heartedness could triumph over his love of the weed was proved during the Franco-German campaign, when he resigned a cigar which he had been treasuring for use after the battle to a wounded soldier, who cast longing eyes at the precious weed. His great contemporary, General Moltke, was equally devoted to smoking joys, and was rarely seen without a huge cigar between his firm lips.

Professor Huxley stated, in the course of a lecture, that he considered tobacco a "sweetener and equalizer of temper," and he supported his theory by consuming vast quantities of the same on all occasions. Charles Lamb, the delightful essayist, held a similar opinion, and he was once heard to express the wish that "his last breath might be drawn through a pipe and exhaled in a puff."

Both Charles Dickens and William Thackeray loved a good cigar, though, curiously enough, the former rarely refers to the smoking habit in his fictions with any degree of enthusiasm; but Lord Lytton, the famous contemporary of the two aforesaid writers, not only revelled in the making of smoke, but glorified the process in various portions of his voluminous works.

Thomas Alva Edison smokes, to use a popular simile, "like a funnel," and has often been known to consume a dozen cigars in the course of a working day. When pondering the details of a novel invention he confesses that he is greatly aided in the process by the presence of a fragrant weed, and there are few brainworkers who do not find their wits stimulated and sharpened by such extraneous aid.

On the other hand, there are many famous people who view all forms of tobacco with undeniable aversion. Napoleon the Great was one of this class, and after making an heroic attempt to smoke a pipe in his early manhood, he abandoned the business with alacrity, and never smoked again.

The celebrated Dr. Abernethy hated nicotine with fervent hatred, and, on being asked if tobacco injured the brain replied, testily, that the question was a vain one, seeing that nobody possessed of brains would contemplate smoking for an instant. Equally Mr. Algernon Swinburne, the famous poet, is an enemy of the weed, and cannot remain in a room where the odour of tobacco has penetrated.

THE TOLKA.

A FAMOUS COUNTY DUBLIN RIVER.

ITS HISTORICAL ASSOCIATIONS.

I.

The scenery in the neighbourhood of Dublin has been a theme of praise to every Irish tourist, from Giraldus Cambrensis to S. C. Hall. Its beauties have been compared to various models of the picturesque, with comparison of its bay to the bay of Naples, to the complimentary one of an unfinished mill on the canal, to the ruins of the Colosseum. It has a point of resemblance to Athens, too. The Tolka and Dodder are the Cephissus and Ilissus of Dublin; and, in some of their associations, may challenge comparison with the rivers that watered the city of Minerva.

The Tolka lies on the north of the city. it springs in a dead flat; and its uniform, sluggish stream, surrounded by pastures and farms, is, until it approaches within six miles of Dublin, by no means picturesque. The first towns to be passed are Dunboyne and Mullahuddart, now miserable villages, but once, ere Corporation reform was dreamed of, boroughs. The latter place is under the special protection of the Blessed Virgin. It has one of the numerous Irish wells dedicated to her, which was once a place of pilgrimage much resorted to. It also boasted of an ancient society, established as early as the reign of Henry VI., A.D. 1532, the "Guild or Fraternity of the Blessed Virgin Mary of Mullahuddart." This guild is stated by Mr. Mason (His. St. Patrick's Cathedral) to have been established by Act of Parliament, convened by Richard Talbot, Archbishop of Dublin, and then Lord Justice. It was possessed of some property. Near the ruined church there rests, among others of minor note, the dust of one man, remarkable in Irish history, Richard Beling, Secretary to the Supreme Council of the Confederate Catholics at Kilkenny, after the rebellion of 1641, the emissary from that body to the Pope, and the man who brought Cardinal Rinuccini in Ireland. On Cromwell's arrival he fled to France, where he is supposed to have written "Vindiciæ Catholicorum Hiberniæ." At the restoration he returned to Dublin, and his ashes repose in Irish clay.

The next village the tourist will pass on his way to Dublin is Clonsillagh. It is under the special protection of St. Mochta, the disciple of St. Patrick; but the good saint has left nothing to identify him with the place, save the questionable virtues of a holy well. All Irish saints had wells, like eastern patriarchs; but these were not so restricted in the allowance, for St. Patrick alone had some hundreds to his own share, including one we shall presently pass at Finglas

From Clonsillagh, the interest of the journey to the mouth of the Tolka rapidly increases. The river runs through a well-planted valley, overshadowed by magnificent trees, as perfect a specimen as could be found of that rich and peaceful landscape which the English pen and pencil love to paint, particularly in the neighbourhood of Sheephill. Scribblestown (or Skebrystown), and Cardiff's Bridge.

On the high road at the left, as we descend the river, stands the observatory of Trinity College, at Dunsink. It owes its origin to a bequest of Provost Andrews, who died in 1774, out of which, with large additions made by the Board, it was erected in 1785. The Professor of Astronomy lives here. The first who held the office was Dr. Henry Ussher, who was succeeded by Dr. Brinkley; and on his promotion to the Bishopric of Cloyne, Professor, Sir William R. Hamilton, was appointed. The character of the two latter in the world of science is well known.

At Cardiff's Bridge are the ruins of an iron factory; insignificant in comparison to the giant creations of modern mechanics, it was curious for its antiquity; it was an iron mill in the sixteenth century. A little lower down the river, on the opposite bank, there are the remains of an old tannery, and a curious irregular old house. This house, with its square "look-out" rising stiffly from the roof—its red tiles and blackened walls, unsheltered by a tree—is very conspicuous on the top of the hill, looking as wild and rigid as an electrified tortoise-shell cat. It is one of the places in the neighbourhood which claims the honour of having entertained James II. in his flight from the Boyne to Dublin. Tradition assigns the same distinction to the mansion-house of Johnstown, in the neighbourhood of Glasnevin, of which the site only now remains, the old house having quite disappeared. It is most probable both claims are equally unfounded. After the battle, James fled as fast as horse could carry him to the Castle of Dublin. He arrived at night, not having, as he told Lady Tyrconnell, "appetite for supper after such a breakfast." It is hardy possible he would have stopped within two or three miles of the city on such a journey, in such a mood.

But though the Tolka was not honoured by the last of the Stuarts, its banks were, no doubt, the residence of his successor during his brief visit to our capital. The site of the house in which he abode is at the next bridge as we descend the river, at the picturesque village of Finglas Bridge. From the high road to Finglas, the traveller will observe, on the low ground under the bank on which Dr. Gregory's Asylum stands, a small manufactory, lately used for iron. This building stands on the site of a very ancient mill, which was burnt down in the year 1827. It was, in 1690, the manor mill, and there was a mansion-house attached to it. In that house William reposed for the week during which he remained in the neighbourhood of Dublin, after the decisive victory of the Boyne. On July the 1st, as all men know, that famous battle was fought. On the day but one after, William marched southward, and on the 4th pitched his camp at Finglas. The encampment extended along the slopes which lies above the river, extending from this place to Finglas; and the house referred to, being at the extremity nearest Dublin, became the royal residence. Here William passed what were, probably, the least anxious nights he experienced during many years of his singular career. On the 6th he made his triumphal entry into Dublin, but returned to Finglas; and on the 7th received three deputations from the Bishops and clergy then in Dublin, to congratulate him. The following day he reviewed his army.

But the germ of matters more weighty than the visit of Bishops, or the parade of troops, sprung during William's sojourn in that now forgotten mill. On the 7th of July, the third day after his arrival, was issued his proclamation, promising pardon, with some exceptions and limitations, to such of his enemy's adherents as should come into his allegiance before the 1st of August. This was the first foundation of the celebrated commission for inquiring into and seizing the forfeitures accrued to the Crown by the (so-called) rebellion of the Irish. The first commission of seizures issued five days after, on the 12th of July, the source of such protracted and angry disputes between William and the English Parliament, and commencement of these extensive forfeitures, in which upwards of a million of acres of Irish estates were involved.

On the 9th he broke up his camp at Finglas, and marched southward with a portion of his army, despatching the remainder to the west. Before his departure was prepared the proclamation, which issued on the following day, on a pecuniary subject of less magnitude than the forfeitures, but with which the "glorious memory" is even more intimately associated in popular recollection—the brass money. The circulation of the brass money was not wholly prohibited until the following year; but, by the proclamation of the 10th of July, 1690, its value was cried down—the large half-crowns and crowns to pass for one penny, the small half-crowns at three farthings, and the shillings and sixpences at a farthing. This reduction, great as it was, was insufficient. The intrinsic value of twenty shillings of the money was only two pence. The mint established by James in Dublin in the preceding year had coined old brass and pewter into crowns, and the half-crowns had been re-stamped and issued as crowns. The money so issued was rumoured to be £1,000,000, or more, and Luttrell had threatened to hang any man who would refuse it. The suppression of such "raps" formed nearly as important a feature in William's merits in the eyes of the Dublin tradesmen as the deliverance from the twin evils of "Popery and slavery."

Nearly 115 years after William's departure, a memento of his residence at the old mill-house was oddly found. In 1804 the mill was taken for the purpose of being used in the cotton manufacture, in which it continued to be employed until it was burnt down. A gentleman (Mr. Cockson) who was then residing in the house, returned home late one night, and as he was going for a light along a passage from one room to another, trod upon some nuts which had fallen through a mouse-hole from the room above. He lighted a candle, and on going to look at the nuts, found among them what appeared to be a tarnished halfpenny, but heavier, and which, on being rubbed, proved to a new guinea of the reign of Charles II. Surprised at finding such a curiosity on the floor of a common passage, used and swept every day, he searched for the place it came from, and put his hand on the top of a corbel stone, which protruded from the wall a little above his head, leaving a few inches between it and the ceiling. Here, enveloped in dust and cobweb, he found a little pillar consisting of no less than twenty similar pieces. They had been deposited there by some one about the person of William, and, forgotten in the hurry of his departure, had remained untouched for upwards of a century, for want of a housemaid sufficiently diligent to dust their resting-place, though during the entire time the house had been inhabited.

Finglas was an unlucky locality for the family of Stuart. Forty years before William's arrival, the same ground that his camp occupied had held another encampment, and had been the scene of other deliberations, connected with the first great disaster of their house, and which, like the victory of the Boyne, preceded by a few months the then impending ruin of their cause. In 1649 Lord Ormond was making the last stand for Charles I. On June 19th, he encamped with a portion of his army at Finglas, where he had his head-quarters. Dublin was then held by Jones, with the Parliamentary forces, and Ormond's camp was not broken up until the defeat of Rathmines. There are at Finglas the remains of two old military mounds or batteries; one situated just at the back of the modern glebe-house, and the other in a neighbouring field. They consist of high embankments, enclosed between stone walls, about twenty feet broad, ending with a perpendicular wall at the end, and in an inclined plane at the other. The tradition of the neighbourhood is, that they are the remains of the camp of William. The

field in which the one last-mentioned stands, is still called "The King's Field," and two batteries would have commanded the road which then led to Dublin. But William's troops stayed there only a few days, and it seems more likely that such substantial works were thrown up by Ormond's army, whose sojourn there lasted for months.

The military fame of the Tolka is, indeed, of very ancient date. According to Mr. Dalton ("Hist. Co. Dublin") it would seem that it was the scene of the battle of the Wood of Tolka, celebrated in Irish history as the last struggle made by the Hy Nial dynasty with Brian Boroihme. Malichi, the reigning prince of that house, resigned his throne and the palace of Tara to Brian in 1001. Aodh, the heir presumptive to Malachi, however, determined to make the effort from which the more prudent Malachi shrunk; he collected what forces he could, and met the conqueror in a pitched battle, but was defeated. The restoration of Malichi to be the first of the Irish princes, took place in the same neighbourhood. On Good Friday, 1014, was fought the famous battle of Clontarf; when, on the death of Brian and his son, Malachi resumed the command. The Irish army was, previous to the battle, encamped at Kilmainham, and as the struggle is supposed to have closed near the seashore at Clontarf, the Tolka must have witnessed much of the fighting. Finglas was also the scene of one of the triumphs of Miles de Cogan and Reginald le Gros, at the time of King Henry's conquest. They, with 500 men, routed there, according to the English accounts, some thousands of the Irish, who, under Roderic O'Connor, were then ineffectually attempting to reduce Dublin by a siege.

Having brought the reader to Finglas, we will carry him back to remoter ages still. There is nothing in the ruined and dirty village to please the eye; but there is much in its traditions to amuse the fancy. It was a favourite resort of St. Patrick, and the site of a church and abbey founded by him. He endowed his holy well there with many virtues, and, looking down from this elevated site on Dublin, prophesied that it would become a great city, and the capital of Ireland. The parish church was dedicated to St. Canice. That holy person died about A.D. 600. He was born in Ulster and educated in Britain, and, like many of our other early saints spent much of his time in propagating Christianity, and the learning of his age among the then more barbarous nations of the Continent; but his native country was also the field of many of his labours, and the Christian community at Finglas partook of his care. He himself planted several yew trees about the original church, which, in the twelfth century, had attained a great degree of sanctity. Shortly after the victory of Miles de Cogan, abovementioned, some of the English archers, coveting the goodly trees for bows, laid sacrilegious hands upon them. The indignation of the blessed saint was awakened, and one of the sinful archers, with many of their companions, perished by a plague. This incident is recorded by Giraldus Cambrensis, the first Englishman who published an Irish tour, and if the reader will not believe it, there is little use in telling him (though the fact be recorded by Mr. Dalton), that the old trees lately standing in the grave-yard are the veritable blessed yews in question.

There is, at the gate of the old churchyard, a monument of less questionable authenticity—viz., a perfect old cross. In the opinion of some antiquarians this was one of the crosses used to mark the districts which, from a very early age of the Irish Church, were subjected to the jurisdiction of the Bishops, and known as "crocea," 'or cross lands. According to another theory, the cross is a sepulchral monument. It was the practice with the ancient Irish Christians to mark the grave of a man of peculiar sanctity with a cross; and monuments similar to that in Finglas, used for this purpose, are assignable in date to a period prior to the ninth century. The abbey and church of Finglas counted among its inmates, from the eighth to the eleventh centuries, many a holy anchorite and abbot, or Bishop (for the titles seem used indifferently in the Irish annals). The cross may have been erected over some of them.

But whatever the origin of this cross may be, after it had been long forgotten, the cross itself attained a high degree of sanctity. Upon the arrival of Cromwell, his soldiers, on their march from Dublin to Drogheda, indulged their habitual zeal against images and relics, by breaking the shaft of the cross and prostrating it. Some pious neighbours, to preserve the relic from further desecration, determined to hide it until the danger of its destruction should be passed; the two fragments of it were accordingly buried. It had been concealed and almost forgotten for more than 150 years, the place of its sepulchre being preserved only in the traditionary learning of some of the peasantry, when Dr. Walsh, the then vicar of the parish, and who was in 1812 its curate, heard the story of the cross from a very old parishioner, named White. White himself had heard it from his father, who had died at a very great age. He was a Roman Catholic, and was at first unwilling to tell the place, from a fear that the Protestant clergyman intended some desecration to the venerable stone; but was induced to overcome his fears, and showed a spot near the gate of the old churchyard, not far from the place where the cross now stands. After digging for a few feet under the surface, the cross was found. Dr. Walsh had it exhumed and erected in its present position. The fracture of the shaft is apparent, but in other respects it is quite perfect. It is a little ornamented, and is made of granite, a stone not found within several miles of this neighbourhood, so that it must have been brought from the southern side of Dublin. It would be a great improvement if this curious piece of antiquity were moved from the obscure nook where it stands to the open space opposite the new church.

The parish of Finglas was among the parishes confirmed by the bull of Pope Celestine III., A.D. 1191, to John Comyn, Archbishop of Dublin, as part of the College of St. Patrick. The result of the grant was that the tithes of the parish, instead of being devoted to their legitimate object of paying the spiritual pastors of the parishioners, were soon attached to support the dignity of one of the officials, Finglas, with some other livings, being assigned to the chancellor of the cathedral. This annexation was made in 1219, by one of the most celebrated men among the Irish hierarchy—Henry de Londres, Archbishop of Dublin; Martin Thomas de Castello, the then prebend of Finglas, was the first chancellor of the cathedral. The rectory subsequently continued to be devoted to the same purposes, being annexed to the living of St. Werburgh's, in the city of Dublin.

Among the illustrious dead who died at Finglas, there are two Archbishops of Dublin —Fulk de Sandford (1271), and Archbishop Fitzsimon (1511). The ruin of the old church is associated with one name which deserves more particular mention. It was originally built on its present site in the age of St. Canice; but the first chapel and monastic buildings had perished, and, in 1609, the church, of which the ruin is now standing, was rebuilt. Its original shape was a long rectangle. The visitor will observe another aisle at right angles to the main portion of the building. In the days of the village's prosperity, this limb was thrown into the church, which had become too small for its congregation; but it was originally separate, and was intended for a library, and erected by the exertions of the poet Parnell, who ended his days as vicar of the parish. Through the interest principally of Swift, he was, in 1716, promoted to this living, at that time a handsome preferment. Goldsmith and Johnson, his biographers, kill the poet in the following July, 1717; but he lived for at least one year longer than they allow him, for there is an entry in the parish vestry book, dated April 12, 1718, and signed with Parnell's name, in his own handwriting. He went to London shortly afterwards. His plan of founding a library was commenced, and resolutions of the vestry for completing it were forwarded to him there; but he died on his way back.

Among the eminent literary names associated with Finglas, its former vicar, the Rev. Dr. Walsh, is not to be omitted, whose kind and unobtrusive manners endeared him to his friends, as much as his talents and learning won the favour of the public.

(To be Continued.)

WHEN I GET RICH.

BY REV. P. H. M'CAULEY.

When I get rich, oh, many things I'll do
For all poor folk whose lives are full of care.
Their days, now drear, I'll make so sweet and fair,
They'll know no grief, no sorrow, no despair
When I get rich!

When I get rich the friends I love so dear
Shall know no more those weary, toilsome hours;
I'll light their skies with sunshine, and the showers
Will scatter on their pathway fairest flowers,
When I get rich!

When you get rich! Those friends you loved so well
May not be here, but far beyond the skies.
And never know the hidden love that lies
Within your heart—ah! foolish, vain surmise—
When you get rich!

Wait not till rich, but haste to do it now!
Yes, scattered sunshine—dry the falling tear—
Light up with hope the darkened heart and drear,
That may be near you—Oh, ne'er mind the year
When you get rich!

THE KILDARE ARCHÆOLOGICAL SOCIETY.

ANNUAL MEETING.

The annual general meeting of the Co. Kildare Archaeological Society was held on 20th inst. in the Courthouse, Naas, the Right Hon. the Earl of Mayo, P.C., chairman, presiding.

The Chairman proposed a vote of condolence with the family and relatives of the late Mr. Thomas Cooke-Trench, D.L., on their bereavement, which was carried unanimously.

Sir Arthur Vicars, Secretary, read the report of the Council, which contained a feeling reference to the loss the Society had sustained by the death of Mr. T. Cooke-Trench. The report stated that the Ulster King-at-Arms wished to mention an incident as indirectly traceable to the revived interest in antiquarian research in the county (?). Through the kindness and foresight of the Rev. Father Dunne, of Baltinglass, Co. Wicklow, a valuable official heraldic MSS. of Ulster's Office, over 300 years' old, was discovered in a farmhouse near Baltinglass and restored to the Office of Arms.

The retiring members, Rev. E. O'Leary and Mr. G. Mansfield were re-elected.

The Chairman read an interesting paper on "Some notes on the Vikings, their ships, and how they have harassed Ireland." His lordship pointed out that although Brian Boroimhe defeated the Danes at Clontarf Dublin never maintained the capital of Ireland so far as habitation by Irishmen was concerned.

Rev. E. O'Leary, P.P., read a peper on "Additional Notes on John Lye and Clonaugh, Co. Kildare."

Lord Walter Fitzgerald dealt with the "Pyles or Peel-Towers of Kildare," their method of defence and the engines used to bring their garrisons to surrender.

It was decided that the first week in September be selected for the annual autumnal excursion, the venue being Monasterevan, Dunamaise, and Maryborough.

The proceedings terminated with a vote of thanks to the readers of the papers, the chairman for presiding, and the High Sheriff for granting the use of the Courthouse.

WERE THE FIRST "GERMANS" CELTS?

By C. M. O'Keeffe.

I.

A very inscrutable problem is the origin of the German people. When Tacitus wrote his "Germania"—in the latter part of the first century—the country we term Germany was occupied by Celts. But when the light of history dawns a second time upon the country we find it in possession of das Deutsche Volk. Latham, in his work on Tacitus, is sadly puzzled by this fact, and, after long labours to elucidate it, reluctantly confesses: "It looks as if the Germans of Tacitus were not the Germans of subsequent history." No; they were not. A migration which unquestionably took place is covered with clouds and darkness that seem to be impenetrable. The Germans know nothing of it themselves; and, of course, other people know, if possible, still less. They were not in those times a literary people. "We can follow the High-German as well as the Low-German branch of the Teutonic," says Max Muller,(1) "back to about the seventh century after Christ, but not farther." During these six hundred years —the interval between Tacitus and Charlemagne—the Teutonic race ascended the Danube, as Max Muller fancies, and took possession of the country they now occupy. Higher than this "history cannot ascend." Hence Latham says:—

When the Germans of Charlemagne and his successors conquered (or reconquered) Transalbian Germany, there were neither trace nor record of any previous German occupancy. Yet such previous occupancy rarely occurs without leaving signs of its existence. Sometimes there are fragments of the primitive population safe in the protecting fastnesses of some mountain forest, or fen, whose savage independence testifies their original claim upon the soil. In this way the Welsh of Wales and the Basques of the Pyrenees are monuments of that aboriginal population which held possession of Spain and Britain long before the beginning of history, and which practically holds possession of them now. Yet there is no want of natural strongholds in the country in quesion. The Saxon, Switzerland, and Bohemian range, the forests of Lithuania, might well have been to the Germans of Tacitus what Snowden was to the Britons of Agricola or the Pyrenees to the old Iberians; in which case the present Germans of those countries would be the oldest inhabitants of them—not the newest, as they are.

Some of the German scholars of our day resemble "Japhet in search of a father." They traverse the whole world in search of an ancestry. Thus Von Hammer calls the Germans "a Bactriano-Median nation." Althamer makes Germanus equivalent to homo pronsus virilis and the same as Alaman—i.e., Ganzmann. Wackernagel, on the other hand, explains Germanus by G'ermanus—i.e., Volksgenosse. Luden thinks the term Germania is nothing more than the German Wehrmannei; while Von Hammer makes the name Germani, or Sermani, in its primitive import to have meant those who followed the worship of Buddha: and hence the Germans, according to him, are that ancient and primitive race who came down from the mountains of Upper Asia, and, spreading themselves over the low country more to the south, gave origin to the Persian and other nations. Hence the name of Dschermania, applied in early times to all that tract of country which lay to the north of the Oxus. Jacob Grimm is less hazardous and make the Germans of Tacitus the prothan Von Hammer. He would find the ancestors of the Germany in Germany itself, genitors of the modern Germans.

We are informed by Tacitus, in the second chapter of his famous work, that the inhabitants of Germany were accustomed to celebrate in songs of great antiquity the founders of their race—the god Tuiscon and his son Mann. These are the first specimens of the native language which we find in the pages of Tacitus. But they are not German, and they are certainly Gaelic. Tus is a word signifying "first." There is no word which in meaning resembles Tus more closely, perhaps, than the German word Furst. It signifies "a chief," and has an affinity, in form, to the Latin word dux, in meaning to princeps. The well-known patronymic McIntosh—whose correct Gaelic form is Mac-an-Tuis(2)—signifies the "son of a chief." Tus signifies "primary, a beginning." Thus in Furlong's Irish version of the "universal prayer," the second paragraph begins with the words, Adruighim tu mar mo cead Tus—"I adore you as my first beginning." And thus we read in Donlevy's Irish Catechism, Do cum Dia ar d-tus Adam—"God formed Adam in the first place."

The second syllable of Tuiscon is as Gaelic as the first. The word con in Gaelic signifies "sense, meaning, intelligence, wisdom." It seems to be the radix in such compound names as Connal, Maccon, etc., which are often, though erroneously, supposed to derive their origin from the genitive case of cu, "a hound." Eacconn signifies "rage, madness, want of sense." Eaccon duine signifies "a silly, foolish man"; eacconach, "mad, doting, absurd," the prefix eac being a negative particle. If this be so, Tuiscon signifies "primal wisdom,' 'and seems to be a most suitable name for the divine mind of the universe.

Among the European scholars who attempted to explain this epithet Leibnitz holds a first place; but, ignorant of Gaelic, which at that time was little known to Continental scholars, the efforts of Leibnitz were futile. He was obliged in his despair to suppose the manuscript corrupt, and substitute the word Theutates for Tuiscon. It was an evasion of a difficulty rather than an explanation. This evasion has been adopted by many of his successors. They suppose Theut, or Theutates—not Tuiscon—to be the founder of their race, and from him they fabricate the term Teuton first and Deutsche afterwards.

Absurd as this may appear, it is scarcely more so that what we find in a recent commentator on Tacitus, who is not ashamed to say as an illustration of this subject: "The root of the word Teuton is thu, or do, which originally represented the idea of 'activity,' of 'living, procreating, nourishing,' and also of 'taming, educating, and ruling.' From this root are formed the following words, some of which are still used in the popular dialects: Teut—'God, creator, ruler, father, nourisher' (Thor, Tuisco)."

It is to be observed, in this instance, that while the word to be translated is Tuiscon, the word this commentator chooses to translate is an entirely different word—namely, Theut. He shuts his eyes to the object of inquiry and directs his attention to an object we have not inquired about. This is not all: he appears to consider three words which have no radical connection—namely, Tuiscon, Thor, and Thent—to be identical. Now, the Celtic word Thent (more correctly tuatha) signifies "a layman, an illiterate person"; thor (properly toir) signifies "a noise, thunder"; while Tuiscon (not Tuisco) signifies "primal intelligence." Indeed, it is impossible that the alleged founder of the Deutsche Volk could derive his name from the German thun or the English do, for we are expressly told that Teut, or Teutates, was a Celt, and, being Celtic in his race, it is almost certain that his name likewise was Celtic. We learn from Leibnitz that Teut, or Teutates, was the most famous of the Gallic Celts, and occupied with armed force a large portion of Europe and Asia. He was the Mercury of the Celts; and we know that Tacitus, Deorum maxime Mercurium colunt. Tuatha, or Teutates, represented that portion of the Gaelic nation which was devoted to mechanical and commercial pursuits—the Tuatha-de-Danaans of early Irish history. They were a conquered people who had been subjugated by the Milesians, and who, like other conquered races, applied themselves in their slavery to manufactures and industry. In short, under the name of Teutates, the Gael worshipped the genius of Commerce, who invented their arts and protected their highways.

Tacitus goes on to tell us that Tuiscon, the founder of the German nation, issued from the earth. If this signifies that human wisdom results from the contemplation of the physical universe, the notion harmonises remarkably with the philosophy of Bacon and the ideas of modern times. Be this as it may, certain it is that, according to Tacitus, Tuiscon had a son named Mann—a name which appears to some German writers to be perfectly German. But this is by no means clear, for the Celts venerated a famous hero named Manannan MacLir, or "Manus, the son of the sea." One of the most beautiful of Moore's lyrics relates to this Lir, possibly the mother of Manus, whose daughter, "the fair-shouldered," was transformed by enchantment into a swan, and condemned to wander for many hundred years over lakes and rivers in Ireland till the coming of Christianity, when the first sound of the Mass-bell was to be the signal for her release. Moors says:—

"Silent, O Moyle! be the roar of thy water;
Break not, ye breezes, your chain of repose,
While, murmuring mournfully, Lir's lonely daughter
Tells to the night-star her tale of woes," etc.

The subject of this beautiful song—Fionnuala, the daughter of Lir—was the sister of Manannan, who, according to Cormac's Glossary, "was a famous merchant who resided in and gave name to, the Isle of Man. He was the best merchant in the whole of Europe, and could divine, by inspecting the skies, how long the fair and foul weather would last."

The word Lir is the genitive case of Lear, which signifies "the widespread extensiveness"—a figurative name of the sea. "His real name," says O'Flanagan, "is obscured in the glare of fabulous story." He appears to be the Neptune of Gaelic mythology, for he is termed Sidhe na Cruac—— "the spirit of the cliff"—and was possibly worshipped on those Irish headlands which, according to O'Connor ('Rerum Hibernicarum'), were regarded by the Phœnicians as sacred. He is termed Mac Lir thainigh accein—that is, "the son of the sea who came from afar." Accein is derived from a, "from," and cian, "distant." Manannan is compounded of "Mana," the Isle of Man, and an, "of, or belonging to."

So far as these words go there is nothing in them to prove—what Jacob Grimm(3) vainly labours to establish—that the inhabitants of Germany in the days of Tacitus were Deutsche Volk. Jacob Grimm's "Geschichte der Deutschen Sprache" may be described as an ingenious effort to transmute Celtic words into German. He says, for instance, that that noble tribe, the Marcomanni, derived their name, without doubt, from the German word Mark, "a border." They were borderers, he fancies—lived on the selvage of some undefined territory; they were the Grenzoldaten of some archaic monarchy. But he cannot divine on what frontier they kept guard. Here are his words: "Ohne Zweifel druckt der Name aus Grenzbewohner"—i.e., Without doubt the name comes from "borderers." He admits, however, that the demarcations of ancient territories were forests, not men, and he cannot find in the word Mark any trace of

(1) "Lectures on the Science of Language," vol. i., p. 205.

(2) Tuis being the genitive of tus.

(3) "Geschiete der Deutschen Sprache."

the word forest, or Wald. What Grimm endeavours to prove is simply that the Marcomanni were "border-men" because they lived in a central district! They lay in the heart of the country salvaged by the Rhine on the west, by the Danube on the south, and by the Mænus, or Main, on the north; therefore they were Grenzesoldaten. This derivation is quite on a par with the lucus a non lucendo. The Marcomanni bore the name of "borderers," forsooth, because they were really "middlemen"! "Nevertheless," he says, "the appearance of these people in the army of Ariovistsus seems to mitigate against my derivation, and intimate a different origin for their name." The truth is that the name is derived from the Gaelic marc, "a horse," and beann, "a horn." Their helmets were possibly decorated with horns.

In an account of the invasion of Greece by the army of Brennus,(4) Pausanias (p. 335) tells us that in the language spoken by these formidable invaders the horse was termed marc. According to Irish orthography the word Marcomanni must be written Marcai-mbeann. Of this we have many illustrations. "The old name of Dunmanway, in Cork," says Joyce, "was Dun-na-mbeann (Dunnaman), the fortress of the pinnacles. Dunnaman," he adds, "which is correctly Anglicised form of Dun-na-mbeann, is the name of a townland in Down," etc.

Grimm has attributed not only the vocables of the venerable Gaelic language, but some of the customs for which the Gaels were most remarkable to their countrymen. He has endeavoured to purloin the heroes of the Celts, somewhat as McPherson endeavoured to purloin the Ossian of Ireland. For instance, fosterage in ancient Ireland, and its kindred on the Continent, was regulated by law. The privilege of nursing the children of their chiefs was so highly prized by the Irish, that on receiving the infant they paid a high price for the favour. An old English writer says: "It is not to be passed over that the Irish in particular look upon their foster-brothers in a higher degree of friendship and love than their own brothers, which Spenser takes notice of in his 'View of Ireland.'" "The genius of Ireland," says Grattan, "is affection," and the Brehon laws concerning fosterage prove this to demonstration. Having imbibed milk from the same breast, the youths loved one another in after-life with a fervency of affection surpassing that of twins. When peace was established between rival chieftains, their political alliance was confirmed through the medium of fosterage. If O'Neill was reconciled to O'Donnell, he received into his family the infant son of his rival, and reared it as his own. Irish history has preserved the memory of the intrepid self-devotion of foster-brothers who received the enemy's fire—made a target of their own bodies—shed their blood, and lost their lives in the vicissitudes of war, to save their "milk-brothers" from destruction. When Cæsar, in his "Gallic War," draws a picture of Celtic chivalry he says (l. vi. c. 15), after describing the Druids:

"The knights are another class. Familiar with war, when necessity arises or hostilities break out (which before the arrival of Cæsar was of almost yearly occurrence, as they alternately repelled or made inroads into adjacent territories), and as each chief is great in proportion to the number of his kinsmen and friends, they love to surround themselves with ambacti."

Speaking of this word, Jacob Grimm asks, "Sind es wirklich Gallische?"—"Is it really Gaelic?"—and then takes a world of pains to prove that it is not. It has its root, he thinks, in "amt," "an employment," and comes directly into the German from the Gotric "andbahts," "a deacon," of "amphats," "a servant." He confesses, however, that the Romans at an early period had borrowed this term from the Gaels. "Ambactus," says Festus, "lingua Gallica servus appellatur"—that is, "'Ambactus' in the Gaelic language signifies a servant." For this explanation Festus quotes Ennius. And an old glossary explains "ambactus" in the following words: δοῦλος μιθωτος ὡς Ἔννιος. Jacob Grimm describes a Gaelic coin representing an ox-head and containing an inscription in which "ambactus" occurs. The word gave rise, he says, to the mediæval Latin "ambasciare" and "ambasciator"—the Spanish "embaxador," Italian "ambasciadore," Portuguese "embaixador," French "ambassadeur," and English "ambassador." "Being deeply rooted in the German language and growing out of its very substance," says Grimm, "it must be a stranger to the Celtic tongue, which can furnish no explanation of its meaning unless the idea or the word be subjected to violence."

But the true root of the word "ambactus" is, "am," "a people," and "beact," "a ring, a circle, a compass." The "ambacti" were the encircling swordsmen, the "medios satellites," the royal guards of the chief.

Notwithstanding that passion for Sanskrit which is the incurable malady of many German philologists and blinds them to more copious and adjacent fountains, Jacob Grimm does not venture to derive "ambactus" from "badsch"—"colere." "Die Deutsche Wurzel liegt naher"—i.e., the German root is more at hand and India too distant. He goes on to derive the second syllable, "bact," from the English "back" for a very extraordinary reason. Lucian says, in his "Toxaris," that when seeking to avenge an injury a Scythian, to enlist a faction, sacrificed an ox to the gods, cooked the flesh in a cauldron, spread the hide on the ground, and, sitting on the skin, feasted his friends. Every man who trod on the ox-hide and partook of the flesh pledged himself thereby to assemble partisans and assist in avenging the wrong. Spenser, in his "View of Ireland," tells the story quite as well as Grimm:—

"You may read in Lucian that it was the manner of the Scythians, when any one of them was heavily wronged and would assemble unto him any forces of people to join with him in his revenge, to sit in some public place for certain days upon an ox-hide, to which there would resort all such persons as, being disposed to take arms, would enter into his pay or join him in his quarrel. And the same you may likewise read to have been the manner of the Irish."

This is what Lucian terms, "Kathizesthai eju tes burses." The Scythian seeking to enlist partisans lay upon his back while explaining his grievances, and the men whom he gathered round him and excited to sympathy or fired to anger were termed "ambacti," because, forsooth, the injured Scythian lay on his back! Here is what Grimm writes: "Lage in bak wie Tergum zuweilen, in Tergus immer auch die Bedeutung Corium, so wagte ich, da ienes Ambactus mehr einen edlen Gefahrten als Knecht aussagt, Andbahts sogar auf das symbolische Betreten der 'bursa,' zu ziehen—that is, ehe ventures to derive the word "andbahts," which he deems identical with "ambactus," from the custom of begging help while lying on the ox-hide, as he deems the office of "ambactus" more honourable than that of servant.

Jacob Grimm, on this occasion, has fallen into a serious mistake. The Gaelic "ambact" has no connection whatever with the English word "back"; but it has a most intimate connection with the French word "bague," "a ring." In fact, "beact" and "bague" are identical, at least as to meaning. The verb "beactaim," "to embrace, to encompass," and the adjective "beactamail," "round or ring-like," show that the word—contrary to the opinion of Grimm—has its roots in the Gaelic, the language of ancient France. In endeavouring to make it Teutonic he has subjected the word to violence and distortion. His derivation is fanciful and far-fetched, and Diefenbach, in his "Origines Europeæ," entirely disapproves of it. It is worthy of observation, also, that this French name for a finger-ring is utterly unknown in the other languages of Continental Europe. The Latins term a finger-ring, "annulus"; the Italians, "anello"; the Spaniards, "anillo"; the Portuguese, "annel" or "argola"; the Germans, "Ring"; the modern Greeks, "Kripos," etc. We seek to gain for the origin of the French word "bague" in any of the Continental languages. They contain nothing even remotely akin to it. We are compelled in this way to regard it as a modification of the Gaelic "beact"—a word which signifies not only a ring but a moral quality.

Writing on this subject, W. K. Sullivan (5) informs us that "rich princes in Ireland prided themselves on being surrounded by a brilliant and richly-armed retinue." To a portion of this body-guard the term "amus" was applied. "The 'amus' of Ireland," says Sullivan, "is the 'ambactus' of Cæsar's 'Commentaries.'" "The Gaulish 'ambactus,'" he adds, "is generally considered to have been a servant or attendant, and the functions given to the Irish 'amus' correspond to this view." Sullivan, however, labours under a mistake. The word "amus" is not the word "ambact." "Amus" is derived from "am," "without," and "fios" (6), "knowledge." The "amus" was a military apprentice, the squire of mediæval chivalry. The epithet was likewise applied to a madman—"Tigh na n'amus" signifies a "Bedlam." In both cases the idea of ignorance is conveyed by the word "amus"—an idea which "ambact" never conveys.

(To be Continued.)

AN APPEAL

The Council of the Irish Texts Society find it necessary to make an urgent appeal to those interested in the revival of the Irish language, for subscriptions in aid of the completion of the Modern Irish-English Dictionary, which is being edited by the Rev. P. S. Dinean under their auspices. The want of a standard modern dictionary is so widely realised that the Council feel confident that help will be forthcoming for the purpose of completing the work. The dictionary will incorporate the modern portions of O'Brien's, O'Reilly's, and Coney's dictionaries, and, moreover, every page of it will be carefully collated with Peter O'Connell's great manuscript dictionary, which took thirty years to compile. It aims at being the most reliable modern Irish dictionary yet produced. Through the unremitting energy of the editor and his assistants, a good portion of the work approaches completion, and a mass of material for other portions has been collected. The editor has secured the able assistance of Mr. J. H. Lloyd and other competent helpers as proof readers. A sum of over £200 has been raised privately, partly as a loan and partly in donations, among members of the Council and their friends, but it is found that if the dictionary is to be completed in a manner corresponding to the portions already done, and to the requirements of the case, a further sum of £350 to £400 will be absolutely necessary. The Council, therefore, make an earnest appeal for aid in this important undertaking. It is hoped, if the necessary funds are raised by means of which sufficient assistance can be given to the editor in his arduous work, that the book will be ready before the end of the year, but without such assistance it will be impossible to push it through rapidly. The money raised will go to the remuneration of the editor, assistants, and proof readers. The names of the subscribers will be published in the volume. It is also suggested that schools, colleges, and public institutions interested in the teaching of Irish should subscribe for a number of copies for prizes and other purposes. Subscriptions will be received by the Hon. Secretary, Irish Texts Society, 20 Hanover square, London, W.

(4) Brain, or Brenn, Gaelic for "chief."

(6) The "f" in this and similar cases become through the junction with certain letters, according to the well-known eclipsis, as it is called, of Gaelic grammar.

OUR WEEKLY STORY

ASMEDAI'S RING.

A LEGEND OF SOLOMON AND WHAT THE SAMIR BOUGHT.

(From the "Talmud.")

By Clinton Harby Levy.

The edict had come forth from God that the Holy Temple which was to be sanctified by His presence should be touched neither by iron nor any tool made of iron. The wisest of kings, to whom the sacred task of building the sanctuary had been bequeathed, was utterly perplexed by this command, and knew not how to proceed in the accomplishment of this holy purpose. "How is it possible to hew the immense masses of marble or split the hard logs of wood without the aid of iron?" In his helpless perplexity he summoned his Ministers about him, unfolded the cause of his trouble before them, and asked their counsel and advice. One of the wisest replied:

"Great and mighty King! Among those things created by the Divne Word is one which would serve your purpose excellently, things created by the Divine Word is one it's even more powerful. It was after the first day of creation, during the hour in which night contends with day for the mastery, that the Creator called into being a small worm, the Samir, which is possessed of the remarkable power of crushing the hardest stone by its touch. Where that little worm is, no mortal soul has been able to ascertain."

Complete control of all the spirits had been given to Solomon, so nothing on earth could remain hidden from him. Forthwith he pronounced the wondrous word summoning two Sedim (demons) and commanded them to reveal to him the place in which the Samir was concealed. Tremblingly they replied that this secret was known to their Great King, Asmedai, alone. When asked where that great prince lived, they answered—"He lives very, very far hence, on the topmost peak of a lofty mountain. He has hollowed out a deep well in that mountain, and has filled it with water. Upon its mouth he has placed a huge cover which is sealed to the ground. Every day he ascends to the heavens, and when he returns to earth he examines the seal carefully to see if anyone has tampered with it. Then he uncovers the well, drinks, and, covering it again, reseals the cover."

Thereupon Solomon dismissed the demons, and summoned his brave General, Benaiah, before him. The King gave him a chain upon which the ineffable name of God was graven, together with a seal bearing the same Holy Name, a large quantity of wool, and a thousand bottles of wine. Then said he—"Go and bring me the Samir or Asmedai!"

The courageous warrior lost no time in starting upon his journey. He travelled for many days, and at last reached the mountain and the well. The appalling desolation, lonliness, and silence of that spot would have overcome any other man. But the hero was not in the least discouraged, and prepared to accomplish his difficult task. Below the mouth of this well (dug by hellish art), and just to the right of it, he hollowed out a broad ditch into which he drew off the water that was in the well, stopping the hole in the side of the well with huge pieces of wool. Then he dug another trench, a little higher up, through which he poured all his wine into the well. As soon as he had finished his task he concealed himself and impatiently awaited the coming of the King of the Demons.

At the approach of night, Asmedai descended from heaven, examined the seal, and finding it untouched, removed the cover and lowered himself into the well. As soon as he noticed the wine, inhaling its balsamic perfume, he became suspicious, resolving not to taste it, and to be on his guard. But then he was seized with a burning thirst, and impatiently he swallowed a great draught of the wine. After the first, he drank again and again, swallowing it with all of a drunkard's eagerness. Then he became confused, his head reeled, he staggered and fell, sinking into profound slumber. Benaiah, who had watched every movement, hastily threw himself upon the sleeping demon, placed the holy chain upon his neck, and, closing it with the sacred seal, waited. At last the Prince of the Demons awoke. He felt the chain around him, and uttered so frightful a shriek that the mountain shook and trembled to its base. He writhed in his despair, foaming at the mouth and shooting flames from his eyes; he twisted, turned, and tossed. "Listen," said Benaiah. "Thou hast the Holy Name of God upon thee—all of thy efforts are vain." Asmedai lay still for a moment, and then declared himself ready to execute the will of his new master. Benaiah commanded him to follow, which he did! but wheresoever the King of the Demons passed he left tokens of his fearful power. Here, as his side brushed against a tree, it was blasted to the ground; there he touched a house and it fell into ruins. Later they met a festive marriage train, and the King of the Demons wept as he looked at it. "Why do you weep?" said Benaiah. "Oh, fatal feast!" answered Asmedai; "within three days the bridegroom will die." They went further and came to a farmer, who was just saying to a shoemaker, "Be careful; I want those shoes to last me seven years." Asmedai laughed aloud. "Why do you laugh?" asked Benaiah. "Why do I laugh?" replied he. "That unfortunate man will not live six days, and he wants a pair of shoes that will last him seven years!"

Now they came before the great King. Asmedai trembled with anger, but was silent. He threw a small stick that was between his feet towards Solomon's footstool. "What are you doing?" said the King. "You," fiercely answered Asmedai, "you will occupy no more space than that stick when you are dead, but yet, not satisfied with ruling the whole earth, you must needs also rule over the demons." "Do not be angry, Asmedai," said Solomon; "I require but one thing of you I must build the Holy Temple, and I need the Samir; tell me where the Samir is hidden."

"The Samir was entrusted to the King of the Sea, and he in turn entrusted it to the Woodcock, and bound it by the most terrible oath to keep it forever and never give it up. The Woodcock has taken it up to a lofty, bare, and lonely mountain, where it builds its nest. It feeds upon seeds which it has placed in the crevices of the rocks, and never goes away unless it carries that treasure, the Samir, with it, pressed under its wings."

Once more Solomon called for the trusty Benaiah and sent him to find the Woodcock. The hero started upon his journey immediately. He crossed rivers and climbed mountains, and upon the summit of a high mountain he found the Woodcock's nest at last. Intoxicated with joy, he ran up to it, and threw a large, hard glass globe over the young woodcocks. Then he concealed himself and waited. Before long the Woodcock returned, flew to its nest, and stood by the glass globe. It saw the little woodcocks within, it pushed at the globe, went all around it, struck it with its powerful wings, and pushed it hither and thither. Meanwhile the young birds chirped and cried, and the Woodcock ran round and round, pecking on every side, but all in vain. At last it had recourse to the priceless treasure, entrusted to its care, to break the glass. It drew the Samir from under its wing, and brought it close—but at that moment Benaiah uttered so terrifying a cry that the Samir fell to the ground, when Benaiah joyfully snatched it up and fled. The poor Woodcock, despairing over its broken oath, could only die. Thus it was made possible to complete the building of the Holy Temple; but the King of the Demons still lay chained at Solomon's feet. Intoxicated with power, he revelled in every pleasure. Never satisfied with riches, he piled up treasure upon treasure. Dissatisfied with his own greatness, he erected palace after palace and city after city. Ever seeking new enjoyments, he gathered male and female singers and dancers, and still was he dissatisfied. (See Eccl. chap. 2).

One day his royal prisoner said to him: "Great King, by the aid of the demons and my power thou art become the greatest of all mortals. But my might, thus shackled, accomplishes but a little of what I might perform if I were free. Loose my bonds, intrust thy holy ring to me for only a moment, and I shall make thee more than mortal."

The King, fired with wild ambition, ordered that the chains be removed, and gave him the sacred ring. The Demon, hardly free, made himself a giant whose feet were upon the earth, while his head reached to the clouds. Seizing the ring, he threw it into the sea, and picking up Solomon, he threw him a thousand miles away. Then he assumed the face and appearance of Solomon, and, placing himself among his ministers, pretended to be the King. Thus he commanded and ruled over Israel as king.

Meanwhile, poor Solomon, wandered alone and unknown in distant lands bearing none of the insignia of royal greatness. None noticed his coming in, none stood up when he spoke, none obeyed his commands. In vain did he seek to make himself known, vainly did he declare himself to be the great King of Israel. Scorn and insult followed his protestations; they called him "King of the Beggars," and ran after him with jeers.

The torment of recollections was added to the distresses endured by the unfortunate King. The fame of his great name, the power of his commands, the extent of his realm, the lofty state of his palace, the riches of his treasury, the luxury of his mode of life—thought of all these ran riot in his brain and almost maddened him with sorrow and anger. He looked about him and found himself deserted and alone. In thought he hastened to the seat of his domain, and ran into every glittering chamber, into each room bright with gold and sweet with perfume. Realising the contrast with his present condition, he felt the whirl of madness strike his spirit and chill his heart.

But, then, he thought, perhaps the contempt and ill treatment he had borne were due to the fact that he was so far away from his kingdom that little was known of him and his great power. He flattered himself with the hope that as soon as he showed himself in his royal city he would be greeted as king, and once more enjoy the honours which had been his.

Led, or misled, by this sweet anticipation, he again took courage, regained his former pride, and once more began the old dreams of greatness and good fortune. Then he started on his homeward journey. At this time he suffered the greatest privations and suffering—for he felt the pangs of unappeased hunger. His delusions were shattered, and his fears again roused. Fixing his mind firmly upon his beloved Jerusalem, he gained new strength and joyously continued his travel. Now he is near the holy walls, soon he will tread the sacred streets, already he sees the pinnacles of the chosen city. His heart expands, it throbs with joy, and his imperious gaze sweeps slowly around as if to issue a command and enforce due reverence. His steps become slower and more majestic, although inwardly burning to hasten. At last he entered the royal city, and met a hurrying crowd, coming and going in every direction. Solomon stood still in front of the rushing multitude, waiting for the sudden shout of greeting and homage to break forth.

But the crowd pursued its way, and none took notice of him. Partially undeceived, with trembling heart he hastened towards the

palace, certain that there at least he would find the desired end of his sorrows. He knocked imperiously at the door, and answered the inquiry of the porter, who asked him who he was, with regal dignity, "I am —the King." The porter gave him one insulting look, and, laughing heartily, slammed the door in his face. Solomon could not bear this outrage. He began to cry, threaten, and rage, so that soon a mob of inquisitive persons had gathered round him laughing and jeering. The royal cup-bearer happening to come out, Solomon rushed up to him. "And you," cried he, "you, my faithful servant, will recognise your King. Recall our many feasts, our cheerful entertainments, our sweet confidences." "That Satan may have told you these things I can well believe, but that you are the King no one will believe." Saying these words, he threw a cloak over the King's rags and tatters, and then drove him forth.

With despair at his heart, with bowed head, in deep reflection, he retraced his steps through the streets of Jerusalem. Of all the numerous citizens he was recognised by but one rich man and one poor man. The rich man invited him to dinner, and said to him: "Unhappy man, in what condition I find you after such greatness!" Solomon, angry at this disagreeable consolation, rushed away from the table. The poor man said to him: "Bear contentedly what God's will sends you, and do not lose hope. God can give you again all that He has taken from you." But these friendly words could hardly do much towards modifying the bitterness of his lot. To be an object of scorn where before all had bowed to his will was far greater pain than he could bear. Solomon determined to leave the ungrateful city. Driven by want, curiosity, by unknown hopes, he betook himself to the royal capital of Ammon, and went straightway to the royal palace. To gain admittance he applied to the servants, offering himself for the most menial and arduous labour. The King's cook just happened to need some one, so he engaged Solomon, and made him carry wood, draw water, and perform all such work. But the cook soon noticed that this man possessed higher abilities than befitted such occupations. He was astonished when he listened to the King's learned discourses about animals, plants and nature at large. The cook thus began to love and esteem him, and soon gave him a part of his work to do, keeping him busy in the kitchen. One day Solomon obtained the special privilege of preparing all of the dishes for the King's dinner. The food so tickled the monarch's palate that he called for the one who had prepared the dishes, and appointed Solomon chief of the kitchen.

The King of Ammon had a daughter by the name of Naomi, of rare and wondrous beauty. Wooed by royal princes, she always declined their offers, for she was consumed by a secret love for Solomon. Her mother, who knew of this attachment, determined she should marry him. But the King was very angry, and threatened them both with death. All that the tears of her mother could bring about was the commutation of the death sentence into banishment to the wilderness. In this solitude the generous tenderness of his bride increased the sorrow eating at Solomon's heart, for he could only requite it with tears. Then an ill-defined thought, at last becoming clearer, stole into his mind: there was still one trust, one hope left—prayer. He cast himself upon the ground, the tears gushed from his eyes, and he prayed and humbled himself before the Lord of Thrones and all human greatness. Grovelling in the dust, he prayed and wept again and again.

Then he started on the road to a city which lay near the sea. A fisherman approached him and begged him to buy a fish. He bought it, opened it—when, lo and behold! to his great astonishment and greater joy, there he found the sacred ring which Asmedai had thrown into the sea. He shouted for joy, and already felt like a different man. He assumed his pristine majesty of mien, and felt as if he were ensouled anew by the Divine Spirit.

He hurried to Jerusalem, with his faithful consort, made himself known to the great Synhedrin, and related all his adventures in detail.

The Synhedrin asked Benaiah how the present King treated him, and learned that the King had driven away his faithful counsellors and taken away his commission. He asked the men of the royal court if the King really looked like Solomon, and if they had ever happened to see his feet.* They replied that the King was always careful to cover his feet, and wrapped them in a white robe.

The Synhedrin then advised Solomon to go suddenly into the royal chamber. He went in there, and made the holy ring shine into Asmedai's eyes. Asmedai uttered a fearful cry and vanished.

Thereafter Solomon was tortured by such fears that, as is stated in the Song of Songs,† his bed was guarded every night by sixty armed soldiers.

WHAT THE SEA SAID.

(By Rev. Joseph Farrell, Author of "Lectures of a Certain Professor," born 1841, died 1885).

The wash of the sea on the shingle,
The fringe of the foam on the sand,
The soft twilight hush, in which mingle
Faint sounds of the sea and the land.
All these, and the sun dies in splendour,
And shoreward the grey shadows fleet;
And the sea flings its song, sad and tender,
In waves at my feet.

The waves catch the starlight, and glisten
In broken and shadowy gleams,
And my ears are entranc'd as they listen
To music, like music of dreams.
O, ears! by what fanciful weening,
O, heart! by what magical love
Can one clothe with a voice and a meaning
The sound on the shore?

To my sad heart it whispers a story,
As sad as man's heart, and as old,
That the poet must purchase his glory
By sorrows that cannot be told—
That the crown of the singer, tho' shining
With gems, like a cluster of stars,
Round a pain-stricken forehead is turning,
Scarce hiding the scars.

For the spent wave has fill'd but to languish,
The sparkle is lost in the foam;
With a cry like despair, and like anguish,
The billows roll wearily home.
It was mute when it rose as a billow,
But moans when it strikes on the strand;
Singing death songs it sinks on its pillow—
Hard pillow of sands.

Dash, a heart in the hard world and break it,
'Twill break to the sound of a song.
Only hearts that knew sorrow can make it
Give music whose echo lives long.
Only sad hearts flash out into stories
That live on men's lips through the years;
Poets' lives, when most brilliant with glory,
Are glistening with tears.

Sad mem'ries and ghosts of long faces
Crowd in from the song from the past;
For tho' grief lose its first sting, its traces
Are branded on life to the last;
And to-day will melt into to-morrow,
And years may be added to years,
For from sorrows come harvests of sorrow
And fountains of tears.

THE CENTRE OF SPEECH.

Professor D. J. Cunningham, of Dublin, in a recent lecture, described the inherited nature of righthandedness in man. He also made some very interesting statements about the location, in the brain, of the centre of speech. In all right-handed persons this centre is on the left side of the brain. But in left-handed persons the speech centre is shifted to the other side, so that, as Professor Cunningham says, "The left-handed speak from the right brain."

*Referring to the current belief that the feet of demons have claws like birds.

‡Song of Songs 3:7.

NOTES AND QUERIES.

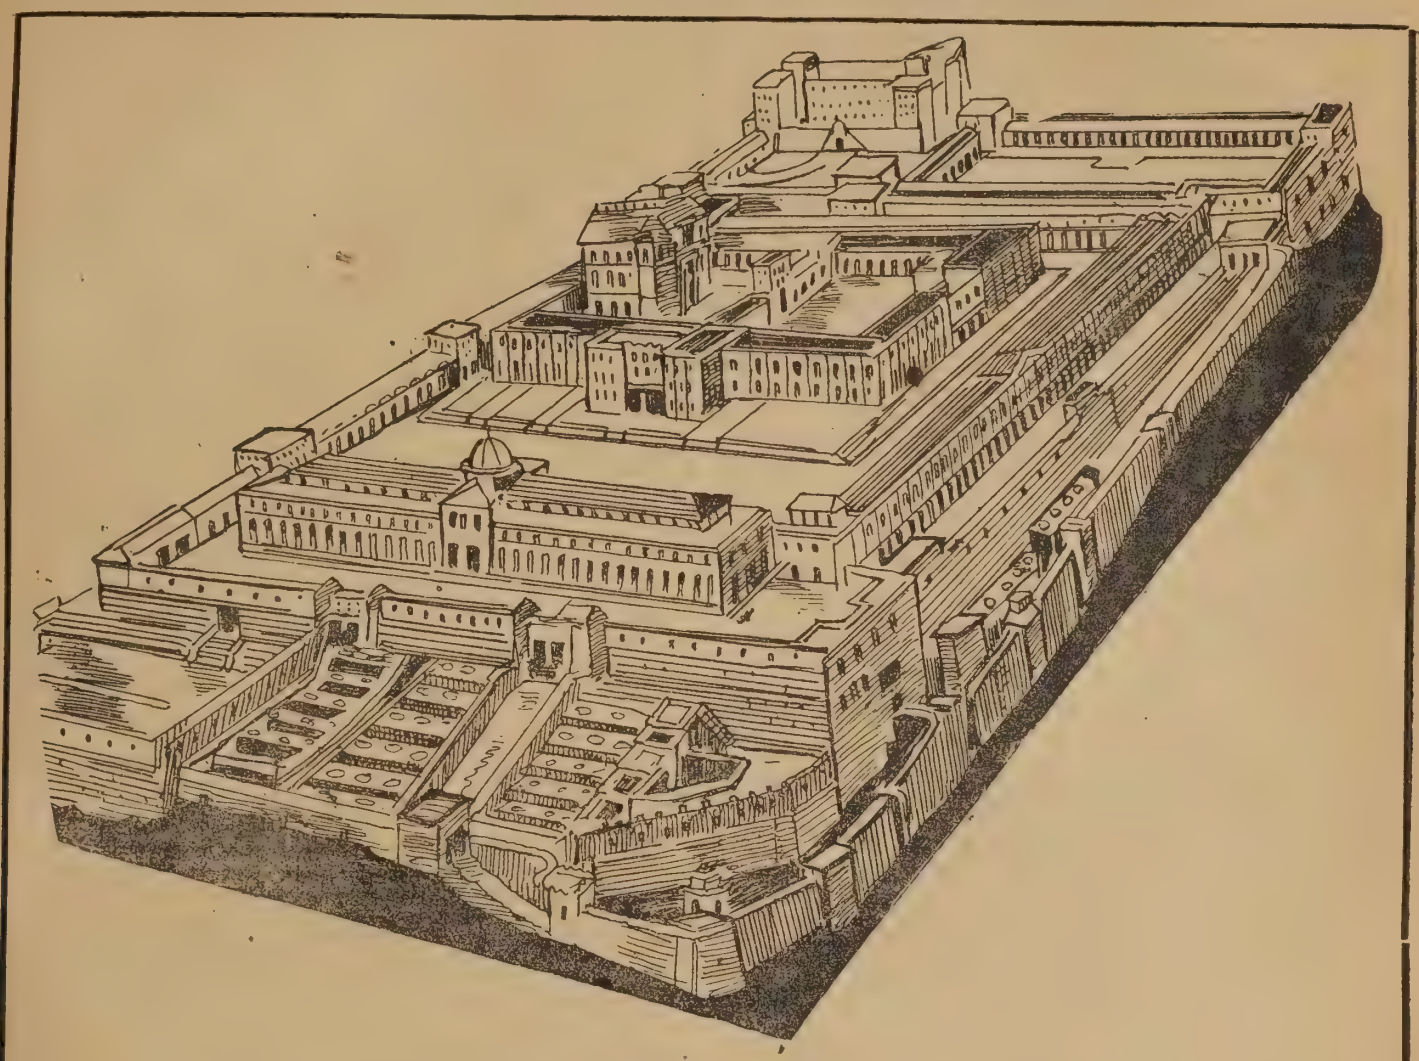
THE RUINED CHAPEL AT KILLINEY.

Will any one kindly give some information about the ruined chapel at Killiney? How old is it supposed to be, and if the little enclosure is still used as a graveyard. A few words about the Druids' grove in the neighbourhood would also be acceptable and interesting to

"INQUIRER."

M. D'ARBOIS DE JUBAINVILLE.

In view of the fact that one of this writer's important works dealing with Celtic Ireland, translated into English by Mr. R. I. Best, of Dublin, is shortly to be published by O'Donoghue and Co., South Anne street, the following extract from a review of his "L'Epopee Celtique en Irelande," by James Darmesteter, London, 1896, will be found interesting—"To M. d'Arbois de Jubainville, the great Celtic scholar, we owe the entry of Celtic studies into the programme of the College de France; before him they were represented solely by the learned M. Henri Gaidoz, the founder of the 'Revue Celtique,' and lecturer on Celtic Literature at the Ecole des Hautes Etudes. When M. Henri Martin established for M. d'Arbois de Jubainville the Professorship of Celtic at the College de France, we all felt that a master had appeared. Since then he has not ceased an instant from his researches. With a talent and a patience alike indefatigable, he has tilled with fecundity the vast uncultured province, which he, above all others, has contributed to bring within the domain of science. Leaving on one side the Gaulish remains of the time of Cæsar, and passing by the modern dialects of Wales, Brittany, and Scotland, corrupted from their primitive state, he has concentrated himself upon the study of Ireland. Ireland, in fact, has the peculiar privilege of a history continuous from the earliest centuries of our era until the present day. She has preserved, in the infinite wealth of her literature, a complete and faithful picture of the ancient civilisation of the Celts. Irish literature is, therefore, the key which opens the Celtic world; and in Irish literature M. d'Arbois de Jubainville attaches a special importance to the early spies and juridical texts, because they bring us nearest to the real social life of their epoch, and to the soul, the instincts, the imagination, and the spirit of the race. The volume which we introduce to our readers proves that now we have a school of Celtic scholars. 'L'Epopee Celtique en Irelande' is the product of M. d'Arbois de Jubainville's lectures at the College de France, and is due to the collaboration of the professor and his pupils. In his former works M. d'Arbois de Jubainville had drawn up a catalogue of Irish epics, had examined them and briefly defined their character and their literary importance; he taught us how to distinguish the cycle of Ulster, which crystallised around the heroic figure of King Conchobar or Conor—the cycle of Leinster, which celebrated the deeds of Oisin, or Ossian, as the moderns have it, and finally the mythological cycle formed on earth, sea, and sky around the conceptions of a religious imagination. He showed us how the two epics of the North and East artificially combined were idealised out of all semblance by the rhetorical Macpherson, in whose mutilated paraphrase a whole generation found a joy for ever. M. d'Arbois and his collaborators, M. M. Dottin Duvan, and Ferdinand Grammont, give in the present volume numerous specimens of these various epochs, which dwell, still unpublished, in the dusty seclusion of libraries and archives."



LECTOR.

WHY THE PTARMIGAN'S TAIL IS BLACK.

One of the most entertaining of recent chapters in natural history is that which relates to the many curious means that birds and other animals possess of deceiving the eyes of their enemies. Mr. E. Sandys, in writing of upland game-birds, calls attention to a remarkable and beautiful instance. When the ptarmigan puts on its winter dress it has a black tail. One might suppose that this would attract attention to the bird crouching on the snow, but in fact it serves for concealment. Every projection on a snow-field casts a dark shadow, and that is what the tail of the motionless ptarmigan looks like, the body of the bird resembling a mere hump on the white background.

THE GREAT TEMPLES OF JERUSALEM.

MODELS FOR THE ST. LOUIS EXHIBITION.

HEROD'S TEMPLE, BUILT 30 B.C.

(CONCLUDED FROM OUR LAST.)

The great Temple of Solomon was destroyed by the Chaldeans, and after the captivity of the Jews, a new one was built upon the same site by Herod, which is known as Herod's Temple. It was finished about thirty years before the birth of Christ. An inspection of the two models reveals a considerable difference in the design of the various buildings. Herod enlarged the temple area, taking into the inclosure the ground space formerly covered by the palaces of the king, and extending the wall to the west. A grand porch, called Solomon's Porch in John, was built where the line of palaces had been, but the inner temple with the Chel and its buildings were arranged much as in Solomon's time. The altar is larger and of stone. The marble pillars in the courts have taken the place of pillars of brass. The upper stone has a greater roof, and the middle tower of the front is unfinished. Herod's fortress, Antonia, has taken the place of the old strong place on the north-west. This temple was destroyed by the Romans.

Equally interesting is the model of the great Christian Church of St. Mary, built in the reign of the Emperor Justinian and known as Justinian's Church. A detailed description of the model is unnecessary here. Dr. Schick was of the opinion that it was erected on the foundations of the temple of Jupiter, built in the second century by Hadrian. The fourth model, Haram Es-Cherif, shows Mount Moriah, the site on which the preceding temples have been built, as it is to-day. It will be seen that a beautiful mosque has taken the place of Justinian's Church. The first building within the inclosure is the Aksa mosque, and close to it the mosque for the women, once the armoury of the Knights Templars. The great mosque shows traces in its architecture of all the phases of ownership it has seen—Byzantine, Crusader, and Saracen.

As could only be expected, the models have caused a great deal of discussion in archæological circles. It is impossible to know in certain instances the exact architecture of the buildings, but all are agreed that Dr. Schick's models represent with marvellous ingenuity and faithfulness the great and ancient worshipping places that have stood upon the famous temple site at Jerusalem. They undoubtedly show great intelligence, patient industry, and profound scholarship. Dr. Schoenecke, the present owner of the models, is always pleased to show them to visitors to Jerusalem, and many Americans have expressed interest in them.

IRISH COUNTY AND FAMILY HISTORIES.

Judging from several of the enquiries that from time to time have appeared in the "Dublin Penny Journal," no very clear idea seems to exist even in Ireland as to what Irish county histories have actually been published. The following list of the Irish county histories that have so far been written, though not claiming to be complete, it at least fuller than that contributed about three years back to a leading Dublin newspaper by one of the most erudite and indefatigable of living Irish writers. It shows also how very much remains to be done in this direction; for whilst some counties have had two, three, or more historians, the greater number have not found one, and still await some intelligent, patriotic, and dutiful son, able and willing to undertake what should surely prove a labour of love, in removing from them this reproach. As to Irish family histories—a subject in which the Irish probably take more interest than any other nation under the sun, querists on this head have hitherto been limited almost exclusively to that interesting and valuable London weekly, "Notes and Queries"; but as its circulation is relatively limited in Ireland, it often happens that enquiries of this nature inserted in its pages receive no reply, from the fact that they are not seen by the persons (in Ireland) most likely to be able to give the information sought for. In such works as, first and foremost, "Burke's "Landed Gentry," Lodge's "Peerage," Dod's "Who's Who" Richard Connelly's, O'Hart's "Irish Pedigrees," etc., is contained a great deal of information relative to Irish families and Irish personages in general; but besides these well-known publications, a considerable number of Irish families have published their own particular histories—as a rule for private circulation only, in consequence of which they are not easily accessible or procurable through that usual channel, the second-hand bookseller. Whilst making no pretensions to be exhaustive, the subjoined list of Irish family histories is, so far as the compiler knows, the first of its kind yet attempted; and it is hoped will lead other contributors to make it as complete as possible. Now that Ireland possesses for the first time in the "Dublin Penny Journal," a weekly publication opening its columns to Notes and Queries of this and all other kinds relating to this country, it should be the endeavour of all its readers to shed as much light as possible on this and like subjects whether of general or particular interest, or in any way connected with our native land.

COUNTY SURVEYS.

The first works issued dealing with the Irish counties collectively were the "County Surveys," brought out mainly by the Royal Dublin Society in the first decade of the 19th century; but even this series stopped considerably short of completion, those of the counties Carlow, Fermanagh, Kerry, Limerick, Longford, Louth, Tipperary, Waterford, and Westmeath having we believe, never appeared. Though the "Surveys" actually published contain only portions of the history of their respective counties, it may be useful to enumerate them, as follows:—

Antrim, by Rev. John Dubourdieu—Dublin, 1812.

Armagh, by Sir Charles Coote—Dublin, 1804.

Cavan, by Sir Charles Coote—Dublin, 1802.

Clare, by Healy Dutton—Dublin, 1808.

Cork, by Rev. Horatio Townsend—Dublin, 1810.

Donegal, by James McParlan—Dublin, 1802.

Down, by Rev. J. Dubourdieu—Dublin, 1802.

Dublin, by Lieutenant Archer—Dublin, 1802.

Galway, by H. Dutton—Dublin, 1824(?)

Kildare, by Thomas James Rawson—Dublin, 1807.

Kilkenny, by William Tighe—Dublin, 1802.

King's and Queen's Counties, by Sir Charles Coote (one vol.)—Dublin, 1801.

Leitrim, Mayo, and Sligo, by James McParlan (one vol.)—Dublin, 1802.

Londonderry, by Rev. G. V. Sampson—Dublin, 1802.

Meath, by R. Thompson—Dublin, 1802.

Monaghan, by Sir C. Coote—Dublin, 1801.

Roscommon, by Isaac Weld—Dublin, 1832(?)

Tyrone, by John McEvoy—Dublin, 1802.

Wexford and Wicklow, by Robert Tighe (one vol.)—Dublin, 1801.

FORMAL COUNTY HISTORIES.

Carlow, by John Ryan—Dublin, 1833.

Clare, by James Frost—Dublin, 1893.

Clare and the Dalcassian Clans, by Very Rev. P. White—Dublin, 1893.

Cork, by Dr. Charles Smith—Dublin, 1749. 3rd. Edition—Cork, 1815. 4th Edition, Guy and Co.—Cork, 1893.

Cork, by Rev. C. B. Gibson—London, 1861.

Cork, by M. F. Clare Cusack—Cork, 1875.

Down, by Walter Harris and Dr. Lyons—Dublin, 1746-1757.

Down, by Alexander Knox—Dublin, recent.

Dublin, by Walter Harris—Dublin, 1766.

Dublin, by John D'Alton—Dublin, 1838.

Galway, by James Hardiman—Dublin, 1820.

Kerry, by Dr. Charles Smith—Dublin, 1756.

Kerry, by M. F. Clare Cusack—Dublin, 1871.

Kilkenny (vol. I.), by Rev. W. Healy, P.P.—Kilkenny, 1893.

Limerick, by Rev. P. Fitzgerald and J. J. McGregor—Dublin, 1826-7.

Limerick, by Maurice Lenihan—Dublin, 1866.

Longford, by J. P. Farrell, M.P.—Dublin, 1891.

Monaghan, by Philip Evelyn Shirley—London, 1879.

Queen's County, by Daniel O'Byrne—Dublin, 1856.

Sligo, by Very Rev. Archdeacon O'Rorke—Dublin, recent.

Sligo, by Colonel Wood—Martin (3 vols.)—Dublin, 1882-92.

Waterford, by Dr. Charles Smith—Dublin, 1746.

Waterford, by Rev. R. H. Ryland—London, 1824.

Waterford, by Joseph Hansard—Dungarvan, 1870.

Wexford, by P. H. Hore, Parts I.—III.—Elliot Stock—London, 1900-2.

To the above might, perhaps, be added such works as—

Louthiana, by Thomas Wright—London, 1748.

Meath—Antiquities by F. Groves, with Annals and Records by John D'Alton—Dublin, 1833.

and Wexford—Chronicles of the County, by George Griffiths—Wexford, 1878.

Though more restricted in their scope, the few Irish Diocesan Histories published up to the present are for the most part exceedingly interesting and valuable works, containing an unexpected amount of local history and biography, such as

Ardagh and Clonmacnoise, Records of (Catholic), by Rev. Canon Monahan—Dublin, 1866.

Cork, Cloyne, and Ross Records, etc. (Protestant), by Dr. William Mazere Brady.

Down, Connor, and Dromore (Catholic), by Rev. James Laverty, P.P., five volumes, 1878-1895.

Killaloe, from the Reformation (Protestant), by Rev. Philip Dwyer—Dublin. 1878.

Killaloe, Kilfenora, Clonfert, and Kilmacduagh (Protestant), by Rev. E. A. Cooke—Dublin, 1886.

Kilmacduagh (Catholic), by Rev. Dr. Fahey—Dublin, 1893.

Meath, Ecclesiastical History of (Catholic), by Very Rev. Dean Cogan—Dublin, 1862-70.

IRISH FAMILY HISTORIES.

Ash Family Records—Edited by Rev. E. F. Martin—Belfast, 1890.

Ball—Anglo-Irish Families of surname Ball, by Rev. W. Ball-Wright—Dublin, 1887.

Barrymore—Records of the Various Branches of the Barrys, by Rev. G. Barry—Cork, 1902.

Beresford of Beresford—Eight centuries of a gentle family.—

Blake Family Records, by Martin Blake—London, 1902.

Blayney, of Ireland and Montgomeryshire, by E. Rowley Morris, 1874.

Boyle—Memoirs of the Boyle Family, 1754.

Brabazons of Brabazon Park, Mayo, and Earls of Meath down to 1825—Paris, 1823.

Brontes in Ireland, by Dr. William Wright, 1894.

Butlers—Some account of the Butlers, 1716.

Coffey—Records of the Sept Cobhthaigh, now Coffey, by H. A. Coffey—Dublin, 1863.

Colles—Records of the Colles Family, by R. W. Colles—Dublin, 1892.

Copinger or Coppinger, of County Cork, etc., by Dr. W. A. Copinger—Manchester, 1882 and 1884.

Corry—Corry Family of Castle Coole, by Earl of Belmore, 1891.

De Burgh—In Marquis Clanricarde's Memories, 1757.

Devereux of Wexford, by Dr. G. O'C Redmond—Dublin, 1891.

Echlin—Genealogical Memoirs of, by Rev. John R. Echlin, 1882.

Flemings of Slane—By Sir William Betham, 1829.

Forbes—Earls of Granard, by Admiral Forbes, 1868.

French—A. D. Weld French—Boston, U.S.A.,

Fortescue, by F. Fortescue (Lord Clermont), 1880.

French—A. D. Wild French—Boston, U.S.A., 1892.

French, Nangle, Nugent, and De Bermingham Pedigrees—By John D'Alton, in One Vol—Dublin, 1847.

Fuller—Some Royal, Noble, and Gentle Descents of the Kerry Branch, by James F. Fuller, 1880.

Geraldine Documents, by Revv. S. Hayman and J. Graves—Dublin, 1870.

Gillmans in Ireland, England, etc, P. W. Gillman, 1896.

Grace—Memoirs of the Grace Family, by Sheffield Grace, 1823.

Guinness—Of Dublin, by R. Linn—New Zealand, 1897.

Gubbins—By Rev. G. G. Gubbins, 1891.

Hamilton Manuscripts, edited by T. K. Lowry—Belfast, 1867.

Hoare, Hore—With all their Branches, by Captain Edward Hoare (of Cork?), 1883.

Irnham—Simon, Lord Irnham, father of Colonel Luttrell, by C. Jenkinson, of Corke—London, 1769.

Kavanagh—In Biography of Arthur M. Kavanagh, by his cousin, S. L. Steele—London, 1891.

Kildare—The Earls of, and their Ancestors to 1773, by Marquis of Kildare, 1858. (Enlarged edition published in 1862).

Kerry Records, Genealogical, etc., by Miss Mary A. Hickson, 1872.

Levinge—by Sir R G. A. Levinge—Dublin, 1873.

Lynch—Genealogical Memoranda relating to the Lynch Family, 1883.

Macnamara—The Story of an Irish Sept, by M Macnamara—London, 1896.

Martin—Of Ballynahinch Castle, Galway, by A. E. S. Martin—Winnipeg, 1890.

Maxwell—Henry, Seventh Lord Farnham, Royal Descents of—Cavan, 1850.

Mercer—The Mercer Chronicle, by an Irish Sennachy, 1866.

MacCarthy—Of Gleannacroim, Co. Cork, by Daniel MacCarthy, Glas, erected 1875.

MacCarthy—Michael Stephen Joseph MacCarthy, by his grandson, C. Desmond MacCarthy, 1885.

McGillicuddy Papers, by Dr. William Maziere Brady—London, 1867.
McGovern—By J. H. McGovern, of Liverpool, 1890.
Montgomery Manuscripts, edited by Rev. George Hill—Belfast, 1869.
O'Brien—The O'Brien Family, by John O'Donoghue—Dublin, 1860.
O'Brien—The O'Briens, by W. A. Lindsay—London, 1876.
O'Byrnes, O'Tooles, O'Kavanaghs. In one volume, 1843.
O'Byrne—Clan, by Rev. P. L. O'Toole—Dublin, 1890.
O'Connors—Of Connaught, by John O'Donovan, LL. D., and The O'Conor Don—Dublin, 1891.
O'Hart—Sketch of Last Prince of Tara, by John O'Hart—Dublin, 1873.
O'Meaghers—O'Meaghers of Ikerrin, by John Casimir O'Meagher, 1886.
O'Neills—Of Lisbon—Lisbon, 1884.
O'Sullivan—In Thoughts on the Early Ages of the Irish Nation, by Richard Joseph Sullivan, 1790.
O'Toole—Clan, by Rev. P. L. O'Toole—Dublin.
Poher, Pohr, or Power, by Dr. Redmond—Dublin, 1891.
Roscommon, Nobility and Gentry of, in "Recollections of Skeffington Gibbons, otherwise Kelly—Dublin, 1829.
Sainthill, of Cork and Devon, by Richard Sainthill, in "Olla Podrida"—1344-1853.
Savages of the Ards, Co. Down, by G. F. Savage Armstrong, 1888.
Sheridans, the Lives of, by Percy Fitzgerald—London, 1886.
Sheridans, an Account of the Sheridan Family in Lady Dufferin's Poems, etc., by Lord Dufferin—London, 1894.
Sheridan, by W. Fraser Rae—London, 1898.
Strangford—Lives of the Lords for Ten Generations—London, Cassell (no date).
Townsend—An Office of the Long Parliament, by Mrs Dorothea Townshend—London, 1892.
Tracy—Pedigree of the Tracy Family of Rathcoole, Co. Dublin, 1853.
Ussher—Ussher Families in Ireland, by Rev. W. B. Wright—Dublin, 1889.

LECTOR.

THE MATIN CAROL.

BY D. M. MOIR.

The splendid matin sun
  Is mounting upward through the orient skies;
The young day is begun,
  And shadowy twilight from the landscape flies.

No more the grey owls roam,
  Seeking their prey 'mid duskiness and shade;
The bat hath hied him home,
  And in some creviced pile a resting made.

Haste, then, my love, O! haste;
  The dews are melting from the fresh green grass;
Arise—no longer waste
  The pleasant hours that thus so sweetly pass.

The frolic hare peeps out,
  Out from her leafy covert, and looks round;
The wild birds flit about,
  And fill the clear soft air with gentlest sound.

Come, love! of softest blue,
  Beneath the bordering trees, the stream flows on;
The night-hawk thou may'st view,
  Sitting in stirless silence on his stone.

The lark soars up, soars up,
  With twinkling pinions to salute the morn;
Over its foxglove cup
  The wild bee hangs, winding its tiny horn.

Bright flowers of every dye,
  Blossoms of odours sweet are breathing round;
The west wind wanders by,
  And, kissing, bends their lithe stalks to the ground.

All things of bliss, and love,
  And gentleness, and harmony proclaim;
Echo, from out the grove
  Murmurs, as I repeat thy dear-loved name.

Haste, then, beloved, haste;
  Come to these cooling shades, and wander free;
My spirit will not taste
  Earth's cup of joy till first 'tis kissed by thee!

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

BY CHARLES SMITH, M.D.

Æquum est enim meminisse & me, qui discerem hominem esse et vos, qui Judicetis ut si probabilia dicentur nihil ultra requiratis. Cicero Univers

IN TWO VOLUMES.

VOL. I.

THE SECOND EDITION, WITH ADDITIONS.

CHAPTER III.—Continued.

A mile S.W. of Carigaline is Kilowen, a new house and pretty seat of Mr. Nash; and more W. is Meades-town, where stood a castle built by the Meades. Hoddersfield, called formerly Ringabroe, a mile W. of Crosshaven, is the seat of Mr. Hodder; on a rising ground near the house is a gazebo which commands a prospect of the harbour of Cork, the ocean, and a vast tract of sea coast. The castle of Ballea is a large ruin a mile W. of Carigaline; it was formerly possessed by the Mac-Cartys, of Cloghroe; and opposite to Coolemore are the ruins of another castle, built by one of the Desmond family. Rinabelly, about three miles S. of Carigaline, is a good house of Mr. Hodder; there is here a dangerous sandy bay, sometimes fatally mistaken by mariners for the mouth of Cork harbour; an hard sand obstructs the entrance. The mouth of this bay opens due W., whereas that of Cork harbour lies in N. More to the S.W., in the parish of Bealfoyl, is Barry's castle, built on a rock, hanging over the coast. At Britfield's town, in this parish, the sea eagle, or osprey, breeds in the cliffs. On the E. side of Oysterhaven is Mountlong, an handsome castle of the Longs; not far from it is Bellgooly, where the Irish had their camp for the first years of the wars of 1641; and this castle is now inhabited by Mr. Bustead. Oysterhaven is still remarkable for excellent oysters.

That part of this barony called Kinalea lies between Kerrycurihy and Bandon river. This tract was named Insovenagh, and was formerly granted to Robert Fitz-Martin; but it belonged to Barry-Oge until the rebellion of 1641. The abbey of Tracton stood two miles S. of Carigaline; it was founded ann. 1224, for Cistercian monks, by the Mac-Cartys. This foundation was confirmed by King Edward III. The abbots of it formerly sat in Parliament. The monks pretended to have a piece of the cross, which, they said Barry-Oge, at a great price, obtained and gave them; this was so firmly believed that on every Holy Thursday vast multitudes resorted to pay their devotions to this supposed relic. This abbey was granted by Queen Elizabeth to Henry Guilford, gent., and Sir James Craig, March 20, 1568, on their paying beforehand the sum of £7 15s. sterl. Sir James Craig assigned to the Earl of Cork, who passed a patent for this abbey, March 23rd, 7th of James I., and was by him given to his son Francis Lord Shannon. The monks came from Alba Lauda, in Wales; and this house was called De Alba Tractu; it is now quite demolished; and near it is the seat of Samuel Daunt, Esq.

On the S. side of the river Oonbouy is Rigg's Dale, a pretty seat of the Riggs's, with good plantations, five miles from Cork; this island was famous for producing excellent cheese. And on the other side is Ballynahassick, a small village. Mr. Bennet has here an agreeable country house, well wooded on the S. side, with large orchard and gardens. The river Oonbouy runs near it, under a stone bridge of three arches, being confined by a narrow channel; but is deep, and stocked with good trout, pike, tench, and large eels.

The village of Brinny is in the western extremity of the barony, where there is a decent parish church, and a handsome seat of Mr. Nash.

The castle of Dundaneere stands near the confluence of the Brinny and Bandon rivers. It was built by Barry-Oge. About the year 1612 (3), the East India Company of England had a settlement here for carrying on iron works and building large ships, for which uses they purchased the adjacent woods and lands for £7,000. The following year two new ships of 500 tons were launched, and a dock was erected for building more; they kept a garrison in the castle, and built three adjacent villages; but they were much disturbed in their undertakings by Walter Coppinger and others, against whom they petitioned the Government; and such was the implacable spirit of the Irish against them, that by continually doing them several mischievous ill offices, they forced them at length to quit the country. The great woods on the Bandon river were from that time much demolished, and began to forfeit Spenser's description of it, who named it "The pleasant Bandon, crowned with many a wood." But there are still some large plantations remaining W. of Inishannon. The earth hereabouts is a rich, loamy soil, producing excellent wheat, barley, and potatoes. They manure with sand, lime, and dung.

Inishannon is pleasantly situated on the river Bandon, six miles from Kinsale. The river is navigable to Collier's-quay, half a mile below the place. On the W. side of the town is a fair stone bridge. It was formerly walled, and a place of some note, as appears by the foundations of several castles and large buildings dis-

(3) MS. Sir Richard Cox.

covered in it; but notwithstanding its excellent situation on a navigable river and very fruitful country, it continued to be a poor, decayed village until within these three years that it began to be rebuilt by Thomas Adderly, Esq., who has erected a range of decent slate houses for linen manufactures, with a bleach yard and other conveniences; and so well has the design flourished by the indulgence and encouragement of that worthy gentleman, that although this business is but in its infancy, there were manufactured and bleached at Inishannon, from the 1st of Feb., 1748, to the 1st of Nov., 1749, 422 pieces of sundry kinds of linen, sheetings, diapers, &c., containing 13,886 yards; besides 240 pieces that came to be bleached from the neighbourhood, the water being found to be most excellent for that purpose; and from the 15th of Aug., 1749, to the 23rd of Dec., 1749, there were 318 pieces more manufactured here, containing 12,229 yards, besides 59 pieces then in the looms, of which there are erected for linen and sheeting 59; also two broad diaper looms, and one narrow, besides four for weaving canvass being 66 in all belonging to the factory, and kept employed by Mr. Adderly: he caused all the cloth that was made in this town to be carefully viewed by several gentlemen and dealers in linen, who have certified that for goodness, breadth, strength, and colour, the linen made here equals any other manufactured in Ireland.

What will also much contribute to the establishment of this factory, is a charter-school, which has been lately erected by the encouragement of Mr. Adderly, who has bestowed two acres of land on it for ever, set 40 acres more at half value for 21 years, and promises to renew the lease when required without any consideration. He gave £200 towards the building, also liberty to raise stones and slates on his land, with turf for the use of the school, and obtained an annual subscription of £30 towards its support, by all which encouragements this school proceeds in a happy, thriving way. The Bandon river not only affords the inhabitants excellent water for bleaching, but it gives them the advantage of carrying great quantities of turf down to Kinsale, which firing they have near Inishannon in great plenty. These boats return laden with sea-sand for manure, which is carried into the barony of Muskery and the adjacent country upon horses' backs; the country people give about 16s. for 120 bags of this sand, which hold about a barrel each. They have lime here from the parish of Moviddy in Muskery, which place supplies Bandon and a great part of Carbery with it for manure and building, at a very reasonable price. In digging a canal, to draw water to the bleach-yard of Inishannon, there was some show of coal, frm the deep, black tinged, slaty stones there dug up. On the bank of this canal there is a good appearance of potter's clay, very easy to come at; and near the town is an excellent slate quarry. To the west of this place, Thomas Corker, Esq., has a pretty seat.

From Inishannon to Kinsale the river Bandon is extremely pleasant, having several houses, castles, and woods n its banks, which are high and beautiful. As one rows down this river, it winds in an agreeable manner, and at the end of each turn the sight is pleasingly entertained with the prospect of some neat seat, or romantic building, which opens upon the eye one after the other.

Next below Inishannon is Coolemoreen, lately improved by Mr. Hodder, of Cork, who has built a good house, drained the land, and embanked a part of it formerly overflown by the river. Below this is Golden-Bush, a good house of Mr. Hay's, pleasantly seated on the river. A mile lower is the castle of Poulne-long, i.e., Ship-pool, built by the Roches, as appears from their arms over a chimney-piece. This castle was taken by the Bandonians in 1642, whereby the gained a correspondence to and from Kinsale. It is now a pleasant seat of Edward Herrick, Esq., with good gardens and other improvements; he has also made a very handsome dining-room in this castle, which affords a very beautiful prospect of the river. On the opposite side, but lower down, is Carriganassick, a ruined castle of MacCarty Reagh, in the barony of Courceys; and on the same side are several fine slate quarries.

Dunderrow is a small village two miles from Kinsale, with a parish church in repair. It belonged to the Roches, who had a castle near the banks of the Bandon river. In the churchyard is a monument, with an inscription to the memory of Edward Roche, Esq., of Trabolgan, and his wife, Mrs. Mary Archdeacon, of Monks-town, who both died in the same hour, on the 23rd of January, 1711. Arms, gules three roaches naiant, impaled with gules, a fess between three lions rampant; or, the 1st for Roche, the 2nd for Archdeacon; and within the church is a monument for the lady of Francis Roche, of Holly-hill, Esq., who died the 18th of June, 1731. The other being for his parents.

Near Dunderrow is a large Danish intrenchment, from whence it has its name; dun signifying a fortified place.

[Dr. Smith here details the history, &c., of Kinsale. His account has already been published in the "Dublin Penny Journal" (No. 14), 5th July, 1902.]

Garrets-town, in this barony, is the seat of Francis Kearny, Esq., situated on a rising ground, commanding a prospect of the ocean, on both sides the isthmus of the Old-head of Kinsale, and a good part of the neighbouring country, which is here diversified into agreeable hills and pleasant vales, well cultivated. The house, with the contiguous offices, form an handsome area; the pediments, coigns, doors, and window frames are well built of rustic work and hewn stone; a considerable part of the ground on which they stand was levelled at a great expense, being hewn out of a deep, solid rock. The sea shore, south of the house, is a fine strand, and is, in the summer season, a very agreeable ride; it is called Garrets-town strand, which, with the adjacent lands, were so named from the family of the Cores, many of whom were successively named Garret, who were, before the rebellion of 1641, proprietors of this place. When I was at Liscarol, in the barony of Orrery, where the celebrated battle was fought ann. 1642, the country people showed me a Danish fort, called Lis-Garret, which was defended by 18 of these Cores, who were slain and buried there. The present family of the Kearneys have been settled here since the beginning of the reign of King James I., being forced from the county of Limerick by the oppression of the Earl of Desmond, in Queen Elizabeth's time.

Kinalmeaky (4) was formerly a part of Carbery, and being forfeited by O'Mahony, in the Earl of Desmond's rebelilon, it was, by Queen Elizabeth, granted to Greenville and Beecher, English undertakers, by whom it was first planted with English, and then got the name of a barony. It afterwards gave title to the noble Lewis Boyle, Lord Viscount Kilnalmeaky, and Baron of Bandon Bridge, who was unfortunately slain at the fight of Liscarol. It was formerly a mere fastness, being all wood and bog, so that ann. 1602 the army could not pass it, being obliged to go round by Kinsale in their march from Cork to the siege of Dunboy in Berehaven, but it is now as well improved as any part of the county.

The most considerable place in this barony is Bandon, built by the first Earl of Cork (5), who purchased Beecher's grants; it was incorporated by the interest of the same nobleman, and is divided into two parishes (6) by the Bandon river. There are two churches, and two market houses, one on either side; and beside the churches, there is a Dissenting and a Quaker's meeting-house. The north

(4) This barony contains the parishes of Maragh, Kilbrogan, Briny, Templemartin, and Kilmodane, being 19,273 Irish plantation acres, and 62 plowlands.

(5) In a letter from the first Earl of Cork, to Mr. Secretary Cook, dated April 13, 1632, he says:—"Upon conference with the commissioners, I have been desirous to satisfy myself, whether the works done, by the Londoners, at Derry, or mine, at Bandon-bridge, exceed each other: All that are judicial, and have carefully viewed them both, and compared every part of them together, do confidently affirm that the circuit of my new town of Bandon-bridge is more in compass than that of Londonderry; That my walls are stronger, thicker, and higher than theirs, only they have a strong rampier within, that Bandon-bridge wanteth: that there is no comparison between their ports and mine; there being in my town three, each of them containing 26 rooms; the castles, with the turrets and flankers being all plat-form'd with lead, and prepared with ordnance; and the buildings of my town, both for the number of the houses and goodness of building, far beyond theirs. In my town there is built a strong bridge over the river, two large session-houses, two market-houses, with two fair churches; which churches are so filled every Sabbath day, with neat, orderly, and religious people, as it would comfort any good heart to see the change, and behold such assemblies; no Popish recusant, or unconforming novelist being admitted to live in all the town. The place where Bandon-bridge is situated is upon a great district of the country, and was, within the last 24 years, a mere waste bog and wood, serving for a retreat and harbour to wood-kernes, rebels, thieves, and wolves; and yet now (God be ever praised) is as civil a plantation as most in England, being for five miles round, all, in effect, planted with English Protestants. I write not this out of any vain glory: yet as I, who am but a single man, have erected such works, why should not the rich and magnificent city of London rather exceed, than fall short, of such performances?"

(6) On the south, the parish of Ballymodan; and on the north, the parish of Kilbrogan.

church is called Christ-church, and was built an. 1625, in the shape of a cross; it is well pewed, and strongly roofed, with fine oak, the timber being as straight and as sound as the day it was set up. Where this church stands, there was formerly an old Danish intrenchment. The glebe belonging to the incumbent lies farther north, on the site of the old parish church. The oldest grave-stone in this church is dated ann. 1629, over one Mr. Crofts, one of the first burgesses of this corporation. On the left hand of the altar, beneath an escutcheon, is this epitaph:

From the rude world's campaigns, the much admired
Legard! to this dark garrison's retired.
Legard! the darling soldier, whose loud name
Shall ever flourish in the book of fame.
Whose fair example might alone depaint,
What 'tis to be a military saint.
True to his God, his prince, his friend, his word,
Rare ornaments, but fit t' adorn the sword.

Beneath lieth the body of Edward Legard, Lieutenant to Captain Robert Hyliard, who died the 6th of January, 1678.

On a tomb in the churchyard, I find that Mr. Thomas Harrison, who died anno 1674, bequeathed £10 per ann. to the poor of this parish for ever. They here show the graves of three of Clancarty's men, John Barry (a sergeant) and two others, who were killed by the inhabitants in the late King James's time, on what they call here the black Monday insurrection, which I shall give a farther account of in its place.

In the other church is a fine monument to the memory of Francis Bernard, Esq., one of the justices of the court of common pleas. On the right is a Minerva, reclining on her ægis; and on the left is justice, leaning on her arm, her sword in her hand. Over an obelisk of fine Egyptian marble is a coat of arms, viz., three escalop shells on a bend. On the table is this inscription, in gilt letters of raised brass:

Francis Bernard, Esq;
Obiit Jun XXIX. MDCCXXXI.
Ætatis suæ. LXVIII.

Beneath the west door and the south cross aisle, beneath an escutcheon, is this inscription:

Below this pride of ancestors there lies
Mouldered in dust, death's lovely sacrifice.
Her parents darling, and her husband's pride,
When she was once, a daughter and a bride.
Lovely without, but fairer much within,
Her virtues daily triumph'd over sin.
Thus, ripe for nobler joys, she swiftly fled
To the immortal living, from the dead.
1684.

"Beneath lies interred the body of Mrs. Mary Synge, wife of Mr. George Synge, rector of Kilbrogan, the third son of George, late Lord Bishop of Cork, and daughter of Mr. Thomas Hewit, of Glan-Coole, gent., who deceased the 23rd day of November, 1684.

If grief cou'd speak my loss, or tears retrieve,
Thy weeping monument, I'd ever live."

The market-houses are neat, decent buildings; that on the south side of the river forms a piazza, and is called Saturday's market-house; and the other, on the north side, is called Wednesday's market-house.

In this town there is not a Popish inhabitant (7), nor will the townsmen suffer one to dwell in it, nor a piper to play in the place, that being the music used formerly by the Irish in their wars. They can raise 1,000 men fit to bear arms in this town; and on the last array they had a considerable number in uniform regimentals, being red, faced with black. This place is very populous and industrious; most of the inhabitants are employed in the woollen manufacture, which if properly encouraged would undoubtedly make it the bulwark of the Protestant interest in this part of the country. The linen manufacture may be said to be here only in its infancy. There are two of the four quarter sessions for the county held here, the two others being at Rathcormuck and Mallow. In the year 1623, the August assizes for the county at large were held in it by the interest of the Earl of Cork. Here is a public school, founded by that nobleman; the master has £30 per ann. Besides the Bandon river, over which there is a bridge of six arches, there is a small one which runs through the town, and separates it from part of it, called Bridewell. The streets were so placed that almost every house had a garden to it, which being planted with trees some years ago (8), made it seem as if it was built in a wood, This town within the walls estemed to be 27 acres in its area.

(To be Continued.)

THE DAISY.

BY D. M. MOIR.

The Daisy blossoms on the rocks,
Amid the purple heath;
It blossoms on the river's banks,
That thrids the glens beneath:
The eagle, at his pride of place,
Beholds it by his nest;
And, in the mead, it cushions soft
The lark's descending breast.

Before the cuckoo, earliest spring
Its silver circlet knows,
When greening buds begin to swell,
And zephyr melts the snows;
And when December's breezes howl
Along the moorlands bare,
And only blooms the Christmas rose,
The Daisy still is there!

Samaritan of flowers! to it
All races are alike,—
The Switzer on his glacier height,
The Dutchman by his Dyke;
The seal-skin vested Esquimaux,
Begirt with icy seas,
And, underneath his burning noon,
The parasol'd Chinese.

The emigrant on distant shore,
'Mid scenes and faces strange,
Beholds it flowering in the sward,
Where'er his footsteps range;
And when his yearning, home-sick heart
Would bow to its despair,
It reads his eye a lesson sage,
That God is everywhere!

Stars are the Daises that begem
The blue fields of the sky,
Beheld by all, and everywhere,
Bright prototypes on high:—
Bloom on, then, unpretending flower!
And to the waverer be
An emblem of St. Paul's content,
St. Stephen's constancy.

(7) This was a bye-law of the corporation, made soon after the town was incorporated.

(8) Description of Bandon, by Judge Cox, MSS.

HOW TO KEEP WELL.

GOOD HINTS ON HYGIENIC POINTS FROM A PHYSICIAN.

Said a well-known physician in a chat not long ago: "The growing tendency to keep well instead of being cured is fast relegating medicine to the dead arts.

"We must keep up with the procession, even if it robs us of occupation, and I'll assure you, if every man understood giving himself massage he might practically be his own doctor. For instance, half the world either has, or claims to have, liver troubles. A spare five minutes can be turned to excellent account by giving your liver a lift. Place one hand heavily on the right side at the lower border of the ribs and rub it down slowly four or five inches. Do this a dozen times and you will empty the overfull liver of its superabundant contents. This cures heartburn and remedies cramps by removing the acidity from the stomach as well as relieving the liver.

"The food of a dyspeptic remains too long in his stomach, fermenting and causing inflammation. Try helping the stomach to get rid of its contents. Place one hand at the extreme edge of the left side immediately under the ribs and slightly overlapping them. Then work it round to the right by pressing the fingers in as hard as you can, drawing the hand across to the right with the other hand, at the same time swinging the body to the right, then to the left. Practice never 'set like lead' on your stomach.

"Here is a good suggestion for a plethoric, or full-blooded, man. When waiting for the fellow that doesn't keep his appointment, place your hand at the back of your neck where the hair joins it and rub downwards. You will thus empty the glands and prevent their turning into boils. Or put your fingers on the neck at the angle of the jaw and draw them firmly downward over the course of the jugular vein. This will remove the used-up blood from the brain and make that organ feel light and clear, helping you to keep from getting 'hot under your six collars,' like Kipling's engine.

"If you have a tendency to varicose veins, when you sit down elevate your feet. The blood will flow out of the turgid veins and give you great relief. By deep friction from the heel upward you can encourage the return of the blood to the heart as well as give tone to the feeble veins.

"If you have a red nose it is because the blood enters the superficial vessels of the skin and does not return from it. If you would remedy this condition perform regularly this little feat: Grasp the tip of the nose between the thumb and fingers and massage upward to the root. This method empties the vessels of unused blood, and allows fresh blood to flow. Besides, you are not half as likely to be afflicted with cold in the head.

"One exercise especially designed to prevent a 'bay window' below the ribs is this: Lie flat on your back, raise one foot and leg to its full height without bending the knee, then the other, alternating the motions, or vary the exercise by putting the toes under the bed clothes, raising the body to the sitting posture several times. This exercises the muscles of the abdomen and prevents the accumulation of fat.

"Cold feet, so often found among brain workers, can be obviated by promoting a vigorous circulation. Immediate relief can be had by standing in about one inch of cold water in a bathtub. Stand on one foot and rub it with the other, alternately a number of times for not more than three or four minutes. Follow this up by vigorous rubbing with a crash towel, and the good effects are almost equal to walking in dew, recommended by Father Kneipp.

"A fit of blues is a habit that grows upon one so rapidly that in a short time it becomes a disease. Whenever I feel an attack coming on I put on stout walking boots and tramp till I can go no farther. This effectually dispels melancholia.

"An Oriental philosopher says fast, breathe and exercise and you will never be ill, so we might as well accept the situation that doctors are no longer needed."

LITERARY NOTES.

Sir Leslie Stephen will contribute to the "Atlantic Monthly" during the ensuing year a group of reminiscent papers dealing with English men of letters of the last half century.

✧ ✧ ✧

The agreeable writings of Sir John Skelton should also be utilised. Disraeli had a real friendship for Skelton, and so had Froude, and it was partly at Skelton's instance that Froude wrote his little book on Beaconsfield. I am sorry to hear, by the way, that there is no chance of a biography of Skelton being published.

✧ ✧ ✧

Charles Reade's masterpiece, "The Cloister and the Hearth," has always been a favourite. Sir Walter Besant once said it was the best modern historical novel with which he was acquainted. An edition de luxe of the work is now promised by Messrs. Chatto and Windus. It will have sixteen photogravure and eighty-four half tone illustrations by Matt B. Hewerdine.

✧ ✧ ✧

We understand, remarks a contemporary, that an injunction has been taken out by the representatives of the late George Douglas Brown, author of "The House with the Green Shutters," against the writer of a proposed unauthorised biography of that dawning genius. It would almost seem that the "Bookman" sketch by his friend Mr. Melrose, the newspaper and magazine notices, would be amply sufficient for a life that was, unfortunately, more promise than performance.

✧ ✧ ✧

The interest which attaches to the stirring events of French history at the beginning of the nineteenth century will be augmented for readers in these countries by a volume which Mr. Grant Richards announces for immediate publication, entitled "Memoirs of a Contemporary: Being Reminiscences of Ida Saint-Elme, Adventuress: Of her acquaintance with Certain Makers of French History, and of her Opinions Concerning Them, from 1790 to 1815." The translation is the work of Mr. Lionel Strachey, and the book will be illustrated by a number of portraits and other plates.

✧ ✧ ✧

The author witnessed the battle of Waterloo on horseback behind the French lines, and the following tribute to Napoleon may be quoted—"Those who say that Napoleon was a coward, and that he fled from the field after watching the battle from a safe spot, never saw him in war. During the fight at Mont Saint-Jean I watched the Emperor's face through a telescope shortly before the rout began. He was giving an order for the Grenadiers to make a final attempt to cross a ravine choked with the bodies of French soldiers. His countenance was absolutely impassive. About him were falling the bravest and best. He never frowned. . . . When the Prussians appeared instead (of Grouchy's army), and were already upon our decimated ranks, his officers surrounded him and took him away."

✧ ✧ ✧

There is perhaps a touch of unconsidered humour in binding up Dickens's "Christmas Books" with "Hard Times," but they form the contents of volume 9, just out, of Messrs. Chapman and Hall's Biographical Edition. The introduction shows that the notion of the "Christmas Carol" flashed upon Dickens during a hasty visit to Manchester in the autumn of 1843. In a little over six weeks the story was ready for the printer. Looking to the enormous popularity of the "Carol" since its publication, it is somewhat startling to find that the profit on the first copies greatly disappointed Dickens, and led him, for a time, to suspend his relations with his first publishers.

✧ ✧ ✧

Annie S. Swan has contradicted the ridiculous report in a Scottish newspaper that she was in receipt of a yearly income of £20,000 from her literary earnings. Her whole earnings, she takes the trouble to say, put together over that period fall very far short of that sum. She is quite right to observe that such a statement shows utter ignorance of the subject. "Fortunes are not made in the literary life," she says, "except, perhaps, by the very few at the top of the tree. For the rest, a fair competency is all that can be reasonably hoped for, and that even must ever be a precarious quantity. To be accredited with fabulous wealth lays one open to serious misrepresentations." It is now a good many years since Oliphant, Anderson, and Ferrier published "Aldersyde," the sale of which was stimulated by a postcard from Mr. Gladstone.

✧ ✧ ✧

It seems we are, says the "Sketch," to have a Life of Lord Beaconsfield as well as Mr. Morley's Life of Gladstone. There have been many Lives of Lord Beaconsfield, one of the most interesting being that by which Mr. T. P. O'Connor first made himself known. But we have had no authorised biography, and the personal documents and correspondence from which alone a complete Life could be written are in the hands of Lord Rowton. It is said that Lord Rowton has given access to many of them, but whether or not they will be employed in the forthcoming book is not stated. I may venture to refer the biographer to the Life of "Shepherd" Smith for some interesting Disraeliana. "Shepherd" Smith was for many years the oracle of the "Family Herald," and numbered among his friends such men as Professor De Morgan. He was for years on cordial terms with Lady Bulwer-Lytton, and in her letters to him may be found some very curious glimpses of Disraeli and his wife. It would be unwise to accept every statement of Lady Bulwer-Lytton's as accurate, but in this case there are marks of authenticity about the particulars.

✧ ✧ ✧

The "Academy's" latest competition has been directed to the best original motto in verse to be inscribed on a house once occupied by a deceased, or now occupied by a living author. Some of the attempts are interesting, though, as the judge remarks, the mottoes have usually a too general application. Indeed, many of them do not name the author. Here are some best attempts:—

STEVENSON.

Here I fought: here was my body slain:
Here I wove spells which winged their kindly flight
Soothing for others, as for me, earth's pain:
—Go thou and likewise fight.

CHARLES KINGSLEY.

He not alone his Pegasus could ride,
But galloped gaily down the country side:
A brilliant parson, singer of that blast
From the north-east which struck him down "At last!"

MATTHEW ARNOLD.

The darkness and the strife without
Should make all wanderers in doubt
Knock at this door and pray to win
The sweetness and the light within.

CHARLES DARWIN

Here dwelt the man whose god was Nature's law,
Who solved the riddle of Creation's scroll,
Who worshipped Truth with reverence and awe,
And only doubted God and his own soul.

✧ ✧ ✧

A writer in the "Forum" has been discussing the already much discussed question of Hawthorne's work and personality. Hawthorne, says the writer of the article, never so matched his individual strength against the world as to acquire from the battle confidence and serenity. He never had, either, "that savage but sustaining joy of scorn of the world." He thought like a man with low vitality, and only reached to strength in his supreme work. As an example of the supreme work "The Scarlet Letter" is cited. Of it the writer says—"In that book Hawthorne put the quintessence of all qualities which lay potentially in his previous work—an extraordinary power of visualisation, a sense for the physical symbol, and a relentless pursuit of the symptoms of disordered conscience. By 'The Scarlet Letter' he stands or falls." We should be sorry (the "Academy" remarks) altogether to agree with that somewhat sweeping judgment, for, beautiful as "The Scarlet Letter" is, it cannot stand on its psychology. The "relentless pursuit of the symptoms and disordered conscience" in the book sometimes degenerates into pretty triviality. Its power lies in its elusive spiritual atmosphere, its half-driven inferences, and its delicacy of style. Hawthorne was too introspective to write a really great book, but he lives, and will live.

✧ ✧ ✧

Mrs. Meynell contributes to the "Atlantic Monthly" an article on "Dickens as a Man of Letters." In the main it is appreciative, and that in directions which may, perhaps, surprise those readers who are inclined to neglect Dickens nowadays. It is an appreciation of him as a master of style. We read:—"Dickens, however, was very much a craftsman. He had a love of his metier, and the genius for words, which the habitual indifference of his time, of his readers, and of his contemporaries in letters could not quench. To read him after a modern man who had the like pre-occupation, displayed it, and was applauded for it phrase by phrase—Robert Louis Stevenson, for example—is to undergo a new conviction of his authorship, of the vitality of his diction, of a style that springs, strikes, and makes a way through the burden of custom." There follows this characteristic and true passage:—"The style of Dickens is assuredly not great. It has life enough for movement, but not life enough for peace. That it has life, whether restless or at rest, is the fact which proves its title to the name of style."

✧ ✧ ✧

The instances which Mrs. Meynell quotes show a close and intimate knowledge of her author, as also do the instances quoted of Dickens's lapses into sentimentality:—"As you read him you learn to understand how his vitality was at work, how it carried him through his least worthy as well as his most worthy moments, and justified his confidence where a weaker man had confessed unconsciously the ignominies of false art and luxurious sentiment. Charles Dickens seems to defy us to charge him with these. None the less do we accuse him—at Little Paul's death, for example. Throughout the child's life—admirably told—the art is true, but at the very last few lines the writer seems to yield to applause, and to break the strengthening laws; because in what Hamlet calls the modesty of nature there is not only the beauty, not only dignity, but inimitable strength. The limitations of nature, and of natural art, are bracing. A word or two astray in this death scene; a phrase or two put into the mouth of the dying child 'the light about the head,' 'shining on me as I go,' phrases that no child ever spoke, and that make one shrink as though with pain by their untruthfulness—and the sincerity of literature is compromised." With only one adjective employed by Mrs. Meynell are we inclined to disagree: she calls Dickens's writing "unrhetorical." But surely passage on passage might be quoted of almost pure rhetoric, passages in which the Macaulay influence to which Mrs. Meynell refers was rampant and unashamed.

SCIENTIFIC TOPICS.

The Rome-Paris telephone line was opened to the public in the beginning of December. The trials were most successful. The line is the longest in the world, covering as it does 1,000 miles.

✧ ✧ ✧

The contract for replacing the great telescope that was destroyed by fire recently at the Yerkes Observatory at Williams Bay, Wis., will probably be given to Prof. John Brashear. Six months will be required to complete the work.

✧ ✧ ✧

The first allotment of grants by the Carnegie Institution, which has been endowed by a gift of £2,000,000 from Andrew Carnegie, has been made to Prof. Atwater to enable him to continue his investigations with the Wesleyan calorimeter. The trustees of the Carnegie Institution have also made awards to Yale University. The departments of the University which are to be benefitted are those of palæontology and psychology. The work of Prof. Marsh in the former and of Prof. Scripture in the latter has undoubtedly done much for Yale.

✧ ✧ ✧

Floyd J. Metzger makes a preliminary announcement on a new method of separating thorium from cerium, lanthanum and didymium. He finds that from a 40 per cent. alcoholic solution, thorium is precipitated quantitatively on the addition of fumaric acid, while no change is produced by that reagent in cold solutions of cerium, lanthanum or didymium. When thorium is precipitated in this way in the presence of the above-mentioned elements, traces of these are carried down with the thorium, but may be removed by a single reprecipitation. A number of other weak organic acids are being investigated in the same way, and several of these show interesting results.

✧ ✧ ✧

Experiments have been carried out on a railroad near Frankfort with a device to prevent collisions, with conspicuous success. The invention consists of a small apparatus fitted to the locomotive, which gives visible and audible signals if another locomotive is approaching on the same line of rails, or if a switch is misplaced, while in addition it also renders telephonic communication between locomotives possible. For the purpose of the experiments two locomotives were started for the same point on the same line of rails. When they were a certain distance apart, the apparatus on each locomotive gave signals to the engineers, who were then able to enter into communication.

✧ ✧ ✧

The Department of Vertebrate Palæontology of the American Museum of Natural History has come into possession of three specimens of rare interest. The first is the complete skeleton of a small dinosaur, which has been named "the bird catcher," by reason of its apparent ability to run fast and its long, slender, grasping fore limbs. The second specimen is the great Portheus molussus, secured by Charles H. Sternberg in Kansas in 1900. The fish is 16 feet long, and is one of the most striking specimens of a fossil to be found in any of the world's museums. The third exhibit is a superb pair of tusks of the great Elephas imperator, found last year in Texas. The tusks are 13½ feet in length and about 2 feet in circumference.

✧ ✧ ✧

In order to determine the density of the earth, President F. W. M'Nair, of the Michigan College of Mines, and Major John F. Hayford, of the U. S. Coast and Geodetic Survey, will conduct experiments at the Tamarack mine, which is particularly well fitted for this purpose, since its shaft is one of the deepest in the world, penetrating to a depth of 4,550 feet in strata of uniform density. The density of the earth is largely a matter of scientific conjecture. It has been computed by formulae based on Newton's laws of gravitation. It is true that Sir George Biddel Airy, the British Astronomer Royal, computed the earth's density from experiments which he carried on at a Welsh colliery, but the figures which he obtained varied so much from those based on the formulae that they have not been generally accepted.

✧ ✧ ✧

It is very doubtful whether the splendid work carried on at Ben Nevis will be continued. Want of funds threatened an interruption in the observations some years ago. Then Mr. Mackay Bernard, of Dunsinnan, came to the rescue. Since 1883 the Ben Nevis Observatory and the Low-Level Observatory at Fort William, connected with it, have altogether cost £24,000, some of the observers giving their services for the cause; £17,000 were received by subscription. The Meteorological Council has allowed £100 yearly for the Ben Nevis Observatory, and, since 1890, £250 for the Fort William station. The directors were officially informed this summer that the latter sum would be stopped.

✧ ✧ ✧

The new steel tramway on Murray street between Broadway and Church streets, New York City, was recently tested with a two-horse ashcart with a hopper body of sheet iron, the whole weighing 3,700 pounds. Instead of a dynamometer a short ice balance was used. It was found that the cart was started on the steel by a pull of 320 pounds. The wheels were somewhat too wide for the track, so that it was difficult to keep them from binding on one side or the other against the flanges of the steel plates. It was while they were thus bound that a pull of 320 pounds was required to start the cart. Later it was found that only 200 pounds was required. After it had gathered way, the cart kept moving by an average pull of 100 pounds.

✧ ✧ ✧

One of the latest long-distance and high-speed electric railways is that from Seattle to Tacoma,, which has recently been completed and put into operation. The power is furnished from the Snoqualmie Falls plant, which is 31 miles from Seattle. The line is about 34 miles long, and the current is transmitted outside of the cities at 27,500 volts; and at sub-stations distributed along the line this alternating current drives motors direct-connected to direct-current generators, which will supply the third rail with current at 600 volts. The third rail weighs about 100 pounds to the yard. It is expected to maintain an hourly service between the two cities. The trains will consist of two cars, as a rule. The motor consists of a combination baggage and passenger car, about 42 feet long, equipped with motors with an aggregated capacity of 500 horse-power, and it is expected to make a speed of a mile a minute.

✧ ✧ ✧

The United States Department of Agriculture has been carrying on the work of introducing tea culture in the United States. Experiments conducted at Pinehurst, Summerville, S.C., in co-operation with Dr. Charles U. Shepard have yielded interesting results. Dr. Shepard now has at his place about 100 acres in tea gardens. His factory is well equipped for carrying on the work on a commercial scale and for accurate scientific experiments. The yield of tea in Dr. Shepard's gardens last year was 4,500 pounds. For 1902 there were about 9,000 pounds of marketable tea. Some of the gardens have proven very prolific and profitable, while others have given very slight yields of tea of pure quality. A tea farm is soon to be established in Texas if suitable land can be secured. Whether or not tea growing in America can be made a commercial success will depend in a large measure upon the most rigid attention to the details of field and factory work.

✧ ✧ ✧

Faraday and a host of subsequent experimenters have investigated the electrolytic oxidation of sulphur dioxide in aqueous solution, and have found that under normal conditions one-half the oxide undergoes oxidation to sulphuric acid at the anode, the remaining appearing as sulphur or sulphuretted hydrogen at the cathode. In 1895, however, Dr. Leonard Wacker succeeded in rendering the oxidation quantitative by the concurrent use or production of carriers of oxygen, such as the persulphates, or even the halogens. Mr. Charles B. Jacobs now finds that the same result may be accomplished by a judicious application of the principle that oxidation is facilitated by a concentrated solution and low current density at the anode. In Jacobs' apparatus the anode is a porous composition through which the gas is injected in a continuous stream into the cell, and the anode area is 33 times that of the cathode. The vessel is provided with horizontal electrodes, and an interposed diaphragm. The porous anode constitutes a partition near the base of the cell, and into the lower compartment so formed sulphur dioxide is injected through the pipe, passing through the previous anode and undergoing oxidation therein. An outlet is provided for withdrawal of the sulphuric acid when the hydrometer shall indicate that the desired density has been reached. A refrigerating jacket is provided in order that advantage may be taken of the increased solubility of sulphur dioxide at 0 deg. C. Jacobs, like Wacker, finds that by continuously injecting sulphur dioxide, the sulphuric acid may be brought to standard concentration. While, as stated, the reaction, chemically considered, is quantitative, all of the sulphur dioxide being converted, the electrolytic efficiency is given as 54 per cent; this result is attained with a potential difference of two volts and a current density of 15-20 amperes per square foot of anode surface. Our information is taken from an article by Mr. Clinton Paul Townsend in the "Electrical World."

✧ ✧ ✧

In a letter addressed from Eustis, Florida, to a New York contemporary, Mr. Sydney C. Haley writes:—"It has long been a matter of speculation with me just why a rain will help plants so much more than any form of artificial watering. The popular theory is that when water is applied to vegetation by the latter method, the heat of the sun causes a kind of steam to form, which scorches it. This is obviously incorrect. My own conclusion, which I reached some time ago, and which may, for all I know, be the accepted scientific explanation, is that rain stimulates the plants on which it falls because it is charged with electricity, and that the mere wetting of a plant has little effect on it. A few weeks ago I was reading in your journal, I believe, of an experiment that confirms my view, and incidentally suggests an idea, which, if carried into execution, might prove of immense value. It appears that some experimenter passed a current through some pots in which plants were growing, with the effect that they showed a decided gain in size and fertility over those similarly situated, but not so treated. The difference, if I remember aright, was 40 per cent. Now, why would it not do to apply water electrically charged to the vegetation, and thus stimulate, as nearly as could be, nature's method? The water could be placed in a vessel from which the electricity could not escape, an insulated barrel, for instance, or a pail bottomed with rubber or glass. After the water was charged, it could be applied with the aid of an ordinary rubber hose, with a non-conducting nozzle; and that would be all that would be necessary. Now, I am not an electrician, and have not the means of trying this experiment myself, but if some experimenter would follow my suggestion, I believe discoveries of great practical value might be made."

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

DUBLIN, FRIDAY, SEPTEMBER 14TH.

The grievance arising from the scarcity of weighty half guineas and silver having for some time past being greatly detrimental to the trading interest of the province of Ulster, but more particularly to the inhabitants of Belfast, on Saturday last there was a meeting of the Sovereign, Burgesses, and principal merchants and traders of that town, convened by public notice at the Town Hall, to take the same into consideration, when they unanimously agreed to the following petition:

"To his Grace CHARLES DUKE OF RUTLAND, etc.

"The humble Petition of the Sovereign, Burgesses, and principal inhabitants of Belfast,

"Sheweth,

"THAT the linen trade is the staple of the province of Ulster; that the trade cannot be carried on without half guineas and silver, on account of the multiplicity of very small payments to be made; that very great distress hath been felt for a long time by the linendrapers, manufacturers, weavers, spinners, and every description of persons concerned in the linen trade, as well as by all persons paying or receiving money throughout said province, from the want of half guineas and silver, and that said distress is daily increasing.

"That the town of Belfast is the capital of said province from wence specie is supplied to almost the whole, and that Petitioners are informed that there are half guineas and silver in great abundance in the Mint.

"Your Grace's Petitioners therefore humbly pray that your Grace may be pleased to make such representations as may be needful, in order to procure for your petitioners a supply of half guineas and silver of the new coinage, adequate to the necessities of this extensive and populous province, and your Grace's Petitioners will ever pray."

DUBLIN, FRIDAY, SEPTEMBER 14, 1787.

The improvements at Crow street Theatre advance with great rapidity. Between fifty and sixty men are daily employed in them. A coffee-room will be attached to the buildings, at the angle near Fownes's street. The upper gallery will not be so curtailed as was at first imagined—two of the front seats will be taken off the pit and galleries, and the stage will be so enlarged as to run into what is called the Tap-room of the Shakespeare Tavern in Temple lane. Upon the whole, the improvements are very judicious, and will contribute very much to that accommodation which the public have a right to expect at all places of public amusement.

A savage practice prevails in the markets, which in itself is highly criminal, but from the consequences it is liable to be attended with, merits a most severe and exemplary punishment. The markets, it is known, swarm with rats, and when any of those vermin are caught, it is frequent to besmear them with spirit of turpentine, to set them on fire, and let them loose. An instance of this occurred a few days ago in Ormond Market, and the animal made its way into the warehouse of a merchant on the quay, and would not have only set it on fire, but in all probability the whole neighbourhood, were it not for the immediate exertions of one of the shopboys, who luckily seized the creature, and extinguished the flames.

Wednesday night, between seven and eight o'clock, Dr. Quinan, of South Anne street, was stopped in his carriage by five armed footpads, between the Park and the Horse Barrack Gate, aid robbed of his watch, hat, shoes, and buckles.

DUBLIN, SATURDAY, SEPTEMBER 15.

A great improvement might be made by rough-casting and repairing Ormond and Bloody Bridges, and erecting stone or iron pallisades open down to the crown of the bridge, which would keep the pavement constantly dry and ventilated, as is the case on the Iron Bridge at Colebrooke-dale, where there is an iron pallisadoe open to the gravel, by which the track over the bridge is constantly dry.

Some various improvements might be made in Dublin at little expense, similar to those at Paris, in the public walks, called the Elysian Fields, where the road is only fenced out by trees, as in St. James's Park. The same improvement might be made at Stephen's Green, by taking away the disagreeable wall that surrounds it, and substituting posts for globes, where the trees are wanting. This, with the putting up an iron railing to the College Park in Nassau street, would have a most beautiful effect, and might be completed at no great expense.

The Mansion House in Dawson street has been for some time past fitting up in the utmost style of elegance for the reception of the Lord Mayor-elect, and the stables enlarging which were hitherto but small and inconvenient. The house, it must be confessed, is a noble old structure, being built about a hundred years since, and according to the taste of the times, was wainscotted with good old Irish oak. It has been purchased by the Corporation of the city for the residence of the Chief Magistrates in the reign of George the First, and had been originally the dwelling of a peer of this kingdom.

'Tis with much pleasure we learn that the return of her Grace the Duchess of Rutland to this kingdom will be much sooner than was generally expected. In her absence, her Grace has not been unmindful of Irish manufactures, but in wearing them almost constantly, has given that stamp of fashion which must prove of essential service. No doubt her presence will restore splendour to the Viceregal Court, and give that fillip to trade in general which is at present much wanting in this city.

Yesterday, pursuant to public notice, a Post Assembly was held at the Tholsel by the Right Hon. the Lord Mayor, Aldermen, Aldermen, Sheriffs, and Commons, for electing an Alderman in the room of Sir Anthony King, Knt., deceased, when the four following Sheriffs Peers were returned by the Board of Aldermen to the Sheriffs and Commons:—John Carleton, Esq.; Richard Bolton, Esq.; Hugh Trevor, Esq.; John Sankey, Esq. When the Sheriffs and Commons proceeded to ballot, and on casting up the number of votes, there appeared—For Mr. Carleton, 66; Mr. Bolton, 52. Whereupon Mr. Carleton was declared duly elected, and took the usual oaths of office accordingly.

Among those characters who stand high in the public estimation for a residence on, and unwearied application to, improving their estates, the present Earl of Carhampton may be reckoned one of the first. His seat at Luttrellstown is an earthly Paradise, in the completion of which he every day in the year gives bread to upwards of one hundred industrious labouring men and their families. If such were the practice of the landed gentlemen in general, the nation would soon grow into opulence.

By the preparations making for the Lord Mayor-elect (Alderman Alexander), the City Court promises to be kept for the ensuing year in a style of elegance equal to the Mayorality of any other Magistrate who has come within our knowledge. The carriage is most superb, and we are informed the Aldermen has purchased six elegant black geldings for the purpose of drawing it.

Throughout the whole of his tour, the Duke of Rutland has not expressed so much satisfaction as at Lord Lucan's improvements at Castlebar, where utility and beauty have been so happily united, that 'tis difficult to say whether the ornament of the country or advantage of the people has been most considered.

It is rather unfortunate for the rising feature of commerce in this kingdom, that it should be damped with more bankruptcies since the liberation of its trade, than at any time before. America is the great temptation for making swindlers in this country; it is only to impose upon credit to amass all the money that credulity can produce, and then run off to the Western Continent. One man decamped last week with property to the amount of £30,000. This is a severe stroke to many honest individuals, and several people have smashed, as it is generally termed, within the last fortnight. This proves that there is a radical evil in the bankrupt laws of this country, and must convince, that if some examples are not made, both free and private traders form but a farcical idea in this country.

In Ireconnaught and Connemara, an extent of 40 miles, in the county of Galway, there is but one feeble Magistrate to administer justice, and protect the lives and properties of the inhabitants. For two successive years every species of rapine and plunder has been practised with impunity in this mountainous half-peopled country, and the confederated gang of ruffians laugh at the law; and there are not more than six ploughs employed in this large tract of country. The Barrack of Oughterard is about 20 miles distant, and can be but of little service in a country abounding with havens and fastnesses. There is a vote on the "Commons' Journals" for erecting a second barrack, but through some means or other, never carried into effect. It is hoped, however, the Government will now take the matter up, and by erecting said barrack, give peace and security to that part of the country, in common with the rest of the kingdom.

Mr. Morne, a gardener, residing in Palmerstown, returning home late on Wednesday evening from this city, was attacked on the road by 7 footpads, who took several guineas and some silver from him, but did not offer to take his watch. The instant they had thus plundered him, a gentleman's carriage was passing the road, which they also stopped, and Mr. Morne saw them present pistols, but he hastened away and did not know the result, but supposed the persons inside were treated in the same manner as himself. This happened at a small distance from Chapelizod. The villains made use of horrid imprecations, and threatened his life if he should utter a single word.

LIMERICK, SEPTEMBER 13.

On Wednesday morning Mr. Tomkins, Surveyor, assisted by Mr. Murphy, Gauger; William Wilson, Esq.; a Magistrate for the county of Limerick, and a party of the 27th Regiment, seized in the town of Cahirconlish, a large quantity of private malt, which was safely lodged in his Majesty's stores.

Last Tuesday Mr. Downs, Inspector of Excise; Robert Lloyd, Esq., Surveyor; and Mr. Francis Hayes, L.C. Officer, seized one car load of leaf tobacco, conveying by smugglers to the Irish town, which was safely lodged in his Majesty's stores.

Dublin Penny Journal

A Magazine of Art. Archæology, Literature, and Science

Vol. I., No. 45. DUBLIN, SATURDAY, FEBRUARY, 7, 1903. PRICE ONE PENNY.

BALTINGLASS ABBEY.

AN OLD COUNTY WICKLOW CISTERCIAN MONASTERY.

FROM A DRAWING BY LIEUTENANT DANIEL GROSE, ANNO 1792.

(From Grose's "Antiquities of Ireland," 1791.)

Dermod Mac Murrough, King of Leinster, founded this abbey for Cistercians in 1148 or 1151. The abbot was mitred, and sat in Parliament. King John confirmed its lands, and granted others, and particularly a salt-pit at Arklow. In 1185 Albin O'Molloy was abbot; in a sermon which he preached in Christ Church, Dublin, he inveighed bitterly against the debauched Norman clergy, who had vitiated the probity and innocence of Irish ecclesiastics. He was after Bishop of Ferns.

John Galbally, the last abbot, surrendered the 15th of December, 1537, and had a pension. A grant was made the 33rd Henry VIII. to Thomas Eustace Viscount Baltinglass, of the abbey and its possessions; and another, in the reign of Queen Elizabeth, to Sir Henry Harrington, Knight. The abbey stood on the banks of the river Slaney, which runs in front about 100 yeards from it. There are a long ruined chapel, a belfry, and a lofty plain east window. Not far is Baltinglass Castle, in good repair and inhabited.

WERE THE FIRST "GERMANS" CELTS?

By C. M. O'Keeffe.

II.

Another example of Gaelic chivalry is found in the third book of Cæsar, which is likewise appropriated by Grimm and wrongfully transferred to the honour of the Deutsche Volk. In his account of the Aquitanian war Cæsar informs us that a chief named Adcantuanus, who was invested with supreme authority, endeavoured, at the head of six hundred devoted followers, to break out of the beleaguered city of the Sotiates. These heroic associates of Adcantuanus were termed "soldurii." Each soldurius had a comrade with whom he shared whatever property he possessed. If disaster befell one the other was bound to participate in it or perish by his own hand; "and it was never known in the memory of man," says Cæsar, "that when one soldurius fell the other refused to die." Jacob Grimm roundly asserts that no Celtic language is capable of elucidating the word "soldurius—taugt Soldurii zu erlautern." It is pure German, he says, and its root is the Gothic "skula," "a debtor." But in this instance, as in many others, Grimm prefers Germany to truth. The true form of the word is found in the Greek of Athenæus, and is written by him "silodouroi." The first syllable of this word is "siol," "a tribe." Thus the children of Israel are termed "Siol Israel"; in the Irish Bible the Irish family of Macnamara, for instance, are termed "Siol Aodha," "the tribe of Hugh," etc. The second syllable is "ochda," "of the breast." It is the genitive case of 'uchd," "the bosom." The third part of the word is a modification of "urra," "a chieftain," and the whole means "the tribe or children of the chief's breast." It is a variation of the well-known phrase, "A chuid mo croidhe." The words applied to the heroic clansmen of Lochiel were likewise applicable to the soldurii:—

"They were true to the last of their blood and breath,
And like reapers went down to the harvest of death."

The satellites of Adcantuann seem to have been identical with the "Red Branch Knights" of Conor, King of Emania, who in Irish chronicle make so brilliant a figure, and whose memory still lives in the title of their residence in the County Armagh, in Ireland. "Military orders of knights," says O'Halloran, "were very early established in Ireland. Long before the birth of Christ we find a hereditary order of chivalry in Ulster called Curaidhe na Craoibhe ruadh, or the Knights of the Red Branch."

But if Jacob Grimm can maintain with any show of reason that "soldurius" is German, he cannot at least deny that Adcantuann is Gaelic. The central syllable is this title—for such it is—"can," signifies "the head," and is a misspelling of "ceann," a Gaelic word having the same meaning and sound. The prefix "ad" is intensitive. It is an augmentation of the signification or sense, and signifies "illustrious" in this instance. Adcantuann was the supreme head of the Sotiates, who, as appears from the syllable "tuan," belonged to the Firbolg race. They were plebians and he was their leader. This is shown by the final syllables, the Gaelic form of which is "tuathanach" (from "tuanna"), a word that signifies "of or belonging to the rustics." He was chief of the plebeians. From all this it seems evident that neither "ambacti" nor "soldurii" belonged to the race of the Deutsche Volk. Neither the titles nor those who bore them were of the race of the modern German people. The two words are purely Gaelic, and those whom they designate likewise belonged to the race of the Gael. They were the "knights companions," or "Duinibh uasul," of the Gaelic chieftains.

To render this more intelligible it is necessary to observe that the inhabitants of Ireland consisted in archaic times of three nations, two of whom had been conquered by the third. They were named respectively the Firbolg, the Tuatha-de-Danaan, and the Gaels (Milesians), or Tighernai, the last of whom had mastered the other two. Hence we find in those terrible raids with which they occasionally ravaged the Continent of Europe during two hundred years such terms as Volgae, Volcae, Belgae, Bolgus and Teutomarus, Teutoni, Teutomates, Tigurini, Teutomal, etc.

As an illustration of this we may state that the Eburones, for instance, of the Latin writers were governed by two chiefs, one of whom was termed Catevolcus, the other Ambiorix. The Eburones consisted of two nations, who are represented in these names. The Firbolgs are ruled by Catevolc, whose name is cead, "first"; te, "person"; volcae (bholcae), "of the Firbolgs." The other chief is "am," "the"; "bi," "life"; "toruis," "of the expedition." The sound which "is" has in the Gaelic language ("ish") is represented in Latin by "ix." The O'Moores of Leinster, for instance, occupied a district in the now Queen's County termed Laeighis (pronounced "leesh"), which in Latin is commonly written "Leix."

The name of the Eburones is derived from the place in which they resided—namely, the two banks of the Mosa, or Meuse. "Eb," or "Ib," signifies a "tribe," "ur" signifies "the margin or brink," and "obhan"* (pronounced "oan") signifies "a river." The Eburones inhabited the two sides of the Mosa.

An unbroken chain of testimony, whose primal links are connected with the age of Alexander the Great, attests the existence of a people in classical times who were termed Kimmerii and Cimbri. The peninsula which is now termed Jutland—where it selvages the Northern Ocean—is indicated by many ancient authors as the residence of these people. In conformity with the genius of the Latin language they are termed "Cimbri" by the Romans, while the Greeks term them "Kimmerii" for a similar reason. "The Greeks," says Strabo, quoting Posidonius, "give the name of Kimmerii to those whom we now call Cimbri." This alteration is regarded by Plutarch as trifling and pardonable, and calculated to excite no surprise. The modification of the name is ascribed to time by Diodorus Siculus, who has no doubt as to the identity of the peoples. Ancient writers of high authority give us an explanation of the name. "Cimbri in lingua Gallica latrones dicuntur," says Festus—i.e., "Robbers in the Gaelic language are termed 'Cimbri.'" Plutarch agrees with Festus. In the life of Marius, cap. ii., Plutarch says: "The Germans term robbers 'Cimbri.'" Strabo in like manner (s. 292, 293) indicates the Cimbri as "wanderers and plunderers." But no word which resembles "Cimbri" and expresses robbery is to be found in the Gaelic language, according to Jacob Grimm: "Nun kennt aber keine der heutigen Keltischen Sprachen einen solchen Ausdruck." "The Irish for a robber," he adds, "is 'creachadoir,' or 'spionneadoir,'" and the Welsh term "Cymro" has no connection whatever with "Cimbri."

In what he has said on this subject Grimm does not prove that the Gaelic is destitute of the word "Cimbri," but he proves that he himself is wanting in a knowledge of the Gaelic language. The word "cimb" is found in Cormac's "Glossary," and signifies "money." This is the most ancient form of the vocable, and the Romans, when writing "Cimbri," seem to have had it before them. The letter "b" is dropped as superfluous by modern writers, and is not to be found in O'Brien and O'Reilly. This is the first syllable; the second is "raidhe" (pronounced "ree"), and signifies a "tribe." Thus the "Calraidhe" (Calry) are the tribe of "Cal"; "Ciarraidhe" (Kerry) the tribe of "Ciar," etc. The Cimbri, in short, were warriors in search of booty—soldiers on the look-out for gold. They realised the definition of a Gael as given in Cormac's "Glossary," and translated by Pictet: "Homme allant par violence (pillage, vol) a travers tout pays habite"—"A man who, searching for plunder, traverses every inhabited land."*

There is no word in the Irish or perhaps any other language which carries the mind back to a period so archaic and remote as this worm "cim." It means not only money but slaves. Everyone knows that there was a time when wealth consisted exclusively of cattle, as is evident from the fact that "pecunia," "money," comes from "pecus," "a herd." But this was comparatively a modern period. There was an age still more remote—the twilight of time—when property consisted exclusively of captives and bondsmen, and man was the principal property of his fellowman. This idea seems to be established by the fact that while "cimb" signifies "money," "cime" signifies "a slave." St. Patrick was a "cime." The men who captured him in Gaul, and transported him to Ireland and sold him to the "Cothraighe," were "Cimbri."

It is evident from all this that Jacob Grimm is in error when he asserts—so confidently—that "Cimbri" is a word not to be found in the Irish dictionary. The fact is, it is to be found in no other dictionary; no other language can supply its interpretation, as is evident from the fact that Grimm has explored them all in vain for this purpose. And, as he well observes, the national name of the Welsh has no connection whatever with it. That national epithet is not Cymro, according to Pictet; the true form is Cyn-Bri. It is compounded, he says, of "cine," "a tribe," and "Bri," a proper name. The first colony that ever settled in Britain was led by an adventurer named Bri. The inhabitants of that island were the descendants of these colonists. "Tain" is "a region," "Bri" a man's name, etc.

The Cimbri, unlike the Cyn-Bri, were not a nation; they were a profession. The Romans are termed by an orator in Tacitus "Raptores orbis," but it by no means follows all the citizens of the Roman Republic deserved so opprobrious a name. They were not all robbers any more than they were all soldiers. The Cimbri are found everywhere. Few in number but renowned in history, the Cimbri, says Tacitus, occupied a gulf near the Cherusci and were proximate to the Northern Ocean. Here they pitched their tents and entrenched their camp, the vestiges of which on either side of the river lend corroboration to their fame. Their settlement, consisting of "castra" and "circumvallations," was military, not civil, and their residence apparently transitory in duration and hasty construction.† Of all the writers by whom Cimbri are mentioned a contemporary of Aristotle's named Philemon is perhaps the most ancient. He says that in their language the sea near which the Cimbri abode was termed "More morusca," which signifies, according to Pliny, "mortuum mare," "the lead sea." An explanation of

* De l'Affinité des Langues Celtiques avec le Sanskrit.

* Appearing still in English geographical names—e.g., Stratford-on-Avon, etc.

† In some respects—not all by any means—recalling the predatory expeditions of later times by the Northmen.

this term is to be found, says Thierry, in the Welsh tongue where "mer" signifies a "sea," and "morosis" "dead." But this Welsh explanation has been objected to by Latham, who observes very truly that of all the seas on earth the Baltic is the last which should be termed "dead." Mad with tempests and torn by whirlwinds, it is never tranquil, never dead. This difficulty is easly removed by having recourse to the Gaelic language. The term "more morusea" consists of three words: "muir," the sea; "marbhach" (pronounced "morowa"), "deadly, cruel killing"; and "uisce,"‡ "water." The Baltic is a deadly sea because it is stormy and tumultuous—because, in short, it is not "dead." It is a devouring and insatiable flood. The name applied by the Cimbri to the Baltic is derived from the Gaelic verb "marbhaim" (pronounced "morowim"), "I kill," and this owing to the turbulent character of that furious sea, swollen with the invasive rush of the Atlantic Ocean, lashed with polar gales, and paved with the bones of mariners. In harmony with this view a Greek writer quoted by Strabo describes the Cimbri as Celts—a term which, in his system of geography, embraces all the inhabitants of Western Europe. Nor is this all. The Cimbri are spread by the well-informed Pliny over a wider surface. He does not confine himself to Jutland he discerns them roaming the Mediterranean and encamping on the margins of the Rhine.

As to that terrible band of Cimbri who, between the years 113 and 100, rushed, sword in hand, into Italy and spread havoc and destruction through its northern provinces, and who, as Florus informs us, were believed to have issued from the remotest countries in the West, we can only say of them that they formed not a nation but an expedition. This is evinced by the titles of their leaders. The supreme commander of the Cimbri is termed by Plutarch "Boiorix"—that is, "the life of the enterprise," the vital principle of the expedition. His title, if written in full, would be "fear," "a man"; "beo," "living": "thoruis," "of the foray." (In Gaelic "t" when aspirated becomes silent.) He was the life of the foray. Another is termed "Cesorix"—that is "ceas," "the eyesight"; "thoruis," "of the raid."" Let us here observe, once for all, that an "expedition, journey, pilgrimage, or tour" is always understood by the word turns. When commanded with certain other words the initial of "torus," ceasing to be sounded, becomes, according to the euphonic rules of Gaelic, mortified or eclipsed. The word then becomes simply "orus." "Torus" is the nominative case; "toruis" (pronounced "torish") the genitive. This is the modification of the word which in Latin versions of Gaelic names is often represented by "orix."

Our Celtic historians, such as Thierry and Godwin, entirely unacquainted with the language of the Celts, affirm that "Boio-rix"—as they write it—signifies "King Boio." But this is simply impossible. "Righ," not "rix," is the Gaelic for "king," and it is quite evident that these Cimbri were Gaels. "Rioh' is likewise the human arm, because the king is the arm or executive of the nation. The character which historian ascribe to Boiorix seems to prove that he was worthy of this title. We are told, on the authority of Livy, that his age was youthful, his temper violent, and his courage intrepid. All the inferior chiefs were subjected to Boiorix, the guiding spirit of the great invasion.

Speaking of this expedition of the Cimbri, a commentator of Tacitus says—"Strabo places them on the ocean: Mela in the islands of the Baltic; Pliny to the east of the Elbe, and on the peninsula which took its name from them; Tacitus places them in the same quarter; Ptolemy at the extremity of the Cimbric Chersonese. But upon examination it does not appear that they ever inhabited these places." No, they were not the "inhabitants" of these coasts; they merely landed at them. Their home was "the farthest part of the west." They fortified a camp on the margins of the Elbe, and then marched into the interior, sword in hand. The truth is that these expeditions were Irish, precisely like that which in after ages and in a different locality carried St. Patrick a chained prisoner into Ireland. These warriors were the knights-errant of pagan times, ransacking Europe in search of adventure, gold, and renown. Owing to the frequent recurrence of these invasions, repeated during centuries, the peninsula in question was termed "Cimbric" by the Greeks and Romans.

Speaking of the Gaelic chiefs of Scotland, Sir Walter Scott says—"A young chief was always expected to show his talents for command as soon as he assumed it, by leading his clan on a successful enterprise of this nature (a foray, or "creacadh") either against a neighbouring sept, for which constant feuds usually furnished an apology, or against the Saxons, or 'Sassanachs,' for which no apology was necessary." J. O'Donovan, in his notes to the "Annals of the Four Masters," corroborates this statement by assuring us that the Irish had a similar custom. He describes the "ceanurra," or captain, of an Irish "nation" as organising a foray as soon as he was inaugurated—when he stepped down from the "far-seeing hill."

When the newly-chosen chief descended from the rock of inauguration he hastened at the head of his clansmen to invade some adjacent principality. Now, what was true of the provincial chiefs was likewise true of the "Ardrigh," or supreme monarch of Ireland—the "Imperator Scotorum," as he is termed in a venerable manuscript. He summoned his "urriaghs," marshalled his tributaries, prepared his fleet, embarked his forces, and set sail for the Continent. Being unable—like a modern potentate—to mortgage posterity for the payment of his army, he promised them abundance of booty, kingdoms to ravage, and termed them "cimbri," or pursuers of wealth. We must always remember that the Irish monarchy existed at least two thousand years. "Compared to 'Ierne,'" said Archbishop Ussher, "the name of Rome is modern." Donald O'Neill, in his celebrated letter to Pope John XXII., written in 1316, affirms—what has never been denied—that previously to the arrival of St. Patrick, one hundred and thirty-six kings reigned in Ireland. Many of these kings, however, were "righe go freasabhra," "reges cum reluctantia"—sovereigns whose sway was reluctantly submitted to, whose dominion was not commensurate with the extent of the island. They assumed the title of "Ardrigh," however, when two provinces and a fragment of a third acknowledged their authority. But this was a rare occurrence. The number of Irish kings who in the course of ages could boast of being "righe gan freasabhra"—"rulers whose authority was entirely unopposed"—was comparatively few. These were the men, however, who led armies on foreign expeditions. In his "Life of Nelson," Southey says that Henry II.'s object in invading Ireland was to paralyse the Irish nation and prevent the havoc of his dominions by expeditions of this nature—an object in which he certainly succeeded. Speaking of these expeditions, W. K. Sullivan says:—

"The political organisation of Ireland was very weak for the purpose of defence against an invading enemy; the chief king had no power over the numerous 'subreguli' beyond what he could enforce by his arms, and there was no cohesion even among clans the most closely related . . . Such countries, however, might have sent forth very formidable invading armies in which the principle of military honor, fidelity to the chosen war-chief, and a sense of the common danger in an enemy's country would give that unity of action which could not be attained at home."

Owing to the frequent repetition of these expeditions and the restless character of the Cimbri, owing to the appearance of their armed bands at widely separated points of the Roman frontier; the classical writers were persuaded that the north of Europe was eminently populous, crowded with warlike communities. They describe the Cimbri as extending from the Baltic to the Euxine, and flourishing at one and the same time on the Rhine and the Mediterranean. They give them armies of three hundred thousand men, exclusive of women and children. These exaggerations originated in the mobility and restlessness of the Cimbri, constantly changing their place of encampment and living in chariots and wagons. They appeared in all the splendor of arms, with plumed helmets and dazzling spears, sometimes at the Euxine, sometimes at the Baltic, and sometimes on the Rhine; but it by no means follows that they occupied the intervening country. The French, for instance, at the present day hold Algiers; they have also a settlement on the Gulf of Guinea, but do not occupy the territory between these settlements. The Cimbri were λπάνηστε. They were constantly doing what the Helvetii were restrained by Caesar from accomplishing, what Orgetorix advised them to do—"ut de finibus suis cum omnibus copiis exirent. Niebuhr pronounces the expedition of the Helvetii "one of the most extraordinary phenomena in history." But this was by no means the case. The Cimbri pursued the same practice. It appears astonishing to Latham that a people acquainted with the arts of agriculture should desert their country, burn their houses, and become as nomadic as the Tartars of Asia, who are destitute of corn. The following extract from Keating is calculated, we think, to elucidate this custom. Keating informs us that the Feine-na-h-Erionn*—the ancient militia of Eire—spent one-half of the year in hunting, and during the other half were billeted on the agriculturists, and thus combined the vigilance, energy, and agility of men who live by the chase with the industry, skill, and social virtues of the class who live by agriculture. Thus when they conquered foreign countries they were prepared for either mode of life, and were ready, like the Cimbri, to lay aside the sword and use the ploughshare, or, like the Helvetians, to turn their back on the plough and unsheathe the sword of war—were by turns military nomads and settled agriculturists. We do not see anything incompatible in these occupations. What Tacitus says of the Suevi, "multum sunt in venationibus,' would not hinder them from assiduously applying themselves in the intervals of war to the arts of peace, or from occasionally throwing off the restraints of a monotonous tranquillity and sallying forth like one man, sword in hand, to carry war and devastation into the precincts of "peaceable nations, neighbouring or remote."

To return. The object of Jacob Grimm's work is to demonstrate that in the days of Tacitus the "Vaterland' was inhabited, as it is now, by "Deutsche Volk." More ancient writers, however, such as Pelloutier, maintain that those inhabitants were Celts. J. Grimm labours to establish his theory by showing that the names of the tribes mentioned by Tacitus are "High-German." In seeking to effect this object, however, he entirely fails. For instance, as every Irish scholar knows, the word "sturrich" (pronounced sturree) signifies in Gaelic the summit of a hill. From this word the name of a tribe mentioned by classical writers, the "Sturiori," is naturally derived. Grimm, however, has a different etymology. He fancies it comes from the German "sturm"—the English "storm"—and this for a cogent reason: the "Sturiori," he maintains, were "Cimbri;" the Cimbri were a stormy people. Therefore, the "Sturiori" were "Deutsche Volk."

To conclude, we are compelled, after a read-

†Uisge appears in modern times in English geographical names in the form Usk as applied to a river.

*Fin, or feine, means a rustic or farmer in its literal acceptance; fingast, a diligent farmer.

ing of the "Geschichte der Deutschen Sprache," to declare that very many of Grimm's derivations are, to say the least, far-fetched and fantastic. We regret that we cannot fully coincide with him in his efforts to prove (ingenious as those efforts are) that the "Catti" of Tacitus and Hessians of modern times are one and the same people. We may be considered as fastidious; but we cannot believe that these names are identical. Grimm's conclusions are possibly true, but we hesitate to accept them. We think it is a case in which "the vowels go for nothing, and the consonants if possible for less."

[THE END.]

THE POET'S FAREWELL TO KILLARNEY.

(Air: "Rodney's Glory.")

This quaint composition was written by Daniel Roderick O'Connor, who lived towards the close of the 18th century. It forms the concluding portion of the author's "Loch Lene, the celebrated Lake of Killarney, in a Tour of Six Days." O'Connor's works appear to have been published in two volumes, principally in Cork, according to the "Dictum of Irish Poets." (On November 2, 1788, O'Connor was in correspondence with a brother bard, James Connolly, of Macroom).

"Farewell, you sweet, enamelled plains,
You graceful nymphs and sportive swains,
You bubbling rills, whose tuneful strains
Afford such recreation.
Here new Hesperia seems to rise,
Or Eden greets my wondering eyes,
While fragrant flowers perfume the skies,
And Carrocks sing
On fluttering wing
Lough Lene, the theme of every string,
The source of inspiration.

Here Flora lavishes her pride
Along the lake's transparent side,
Where trout and salmon gently glide,
And leap with exultation.
There Nature yields her choicest store
In richest mines of golden ore;
Thus blest, what need ye wish for more?
Should South or East
With us contest
Still would Killarney be confessed
The glory of our nation.

Who would not Cahirnone survey,
Or Muckross in the month of May?
When foreign peers and noblesse gay
Here seek for recreation;
They are inspired with transports great
When they behold Glena's retreat,
And fair Bellevue's romantic seat
Here satyrs prance
With looks askance,
And nimbly lead the mystic dance
With sportive emulation.

Who would forget the west domains,
Where Dyna murmurs thro' the plains,
And Zephyrs whisper lovesick strains
Along the new plantation?
Fam'd Aghadoe's exalted green,
Dunloe's high fort, and breezy Reene,
And Prospect Hall improve the scene.
Here lambkins feed,
While in the mead
Each tuneful shepherd tunes his reed,
A stranger to vexation."

THE ODDS IN WEATHER FORECASTING.

People have learned by experience to make allowance for error in the predictions of the Weather Bureau, but Professor Arthur Schuster thinks that the allowances should be officially stated. Astronomers, he remarks, are in the habit of giving the value of the "probable error" when publishing their observations. But although meteorology lends itself more readily than any other science to the valuation of deviations from the mean result, the weather forecasters have not adopted the custom of stating the probable error. Professor Schuster looks forward to the time when weather forecasts will be accompanied by a statement of the odds that the prediction will be fulfilled. Then, perhaps, we shall read in the weather column not simply, "rain to-morrow," but "three to one," or "nine to one for rain to-morrow."

THE TOLKA.

A FAMOUS COUNTY DUBLIN RIVER.

ITS HISTORICAL ASSOCIATIONS.

II.

There is a patent, dated the 16th June, 1718, to the Archbishop of Dublin, for holding two fairs on the 25th April and 29th of September, and weekly markets at Finglas; but for a century none have been held, and, in lieu of them, an annual festival was celebrated on the first of every May. The name of the village is derived from "Fion-glass," the "pleasant green." There stood there, until half a century ago, on the triangular patch of grass in the centre of the village, the May-pole. The only other May-pole near Dublin was at Harold's Cross, but it was an obscure concern, when compared with its Finglas rival. A new pole was from time to time provided, as the old one decayed and became unsafe to climb. It was painted once a year, usually at Easter, and sometimes in a very fantastic fashion, with stripes of bright colours like a barber's sign. Maying was a very ancient custom, as every reader of Chaucer knows, and was fashionable ages before the Bluebeard Henry VIII. profaned it. A pole, painted with alternate dark and light colours, emblematic of the division of summer and winter, was a usual accompaniment: but this was not an Irish custom. A budding bush was, and is, Paddy's more appropriate symbol of opening Spring. It is not easy to ascertain when the pole was erected at Finglas. It was prior to the Union, when the village was a favourite watering place, the resort of the fashionable and wealthy, and counted several noblemen among its inhabitants. The pole was probably erected, in those days of its prosperity, by some aristocratic admirer of English pastimes; and the sports about it were originally altogether on the English model, consisting of a Queen of the May ("maid Marian"), dancing round the pole, etc. But "the May" at Finglas attained the height of its celebrity at a later period, about forty years ago, after the society of the village had lost its aristocratic, and assumed a more jovial and rollicking, caste. Noblemen and M.P.'s were succeeded by Smithfield dealers and Dublin shopkeepers—several of whom helped to keep up the sports, and also to change their character. A gentleman named Shew contributed with his purse, and two well-known characters, Watty Cox and Bryan Maguire, aided by their exertions to sustain the sports with spirit. About twenty-five years ago they were beginning to decline, and a club was formed who, for a few years longer, sustained them. In its palmy days the May of Finglas rivalled Donnybrook Fair. The sports consisted of climbing the pole, to the top of which was suspended a leg of mutton, or a pair of breeches; donkey-races, in which each man rode his neighbour's ass, and the last won; running in sacks, in which the man or woman who did not run was sure to win; chasing pigs with soaped tails, grinning through collars, and other like exercises, which, if less athletic, were more merry than their prototypes at the Olympic Games. These were open to all comers, and the prizes were provided from funds subscribed for the purpose by the patrons of the sports and residents in the neighbourhood. Had the meetings ended thus, they might still have survived; but as the neighbourhood became less populous these games were less patronised, and gave place to orgies of a very different class. Attempts were made for some years to put a stop to the proceedings by police interference; and when the last May-pole, in the year 1843, was cut down, some gentlemen interested in the welfare of the neighbourhood very judiciously discouraged the erection of another. The celebration of the May has been for a considerable time interrupted, and will probably never be renewed.

Among the ancient celebrities of Finglas is St. Patrick's Well. It is now a neglected hole in a field at the rear of the parish schoolhouse, with the remains of a small building or arch over it, which was erected by one of the Plunkets of Dunsoughly, about 1756. It was greatly resorted to, especially in the summer of 1768, when, according to Dr. Rutty, "it undoubtedly produced some notably good effects in the cure of divers impetiginous disorders, sore eyes, and inveterate and ill-conditioned ulcers." It was used by applying wet rags to the place affected, and by drinking it. It continued in good repute when Rutty wrote (about 1770). In 1811, the arch over it is stated to have been in good repair, and to have formed a bath, six yards long and three broad. It was bottled, and made a subject of export. It was much used by Dr. Achmet Buromborad, of whom the reader may find a caricature, with some truth, in "Barrington's Sketches." He in his day was in Dublin as great a man as St. John Long in London, and contrived to get large grants of the public money for his baths and quackeries. The Finglas well was, according to tradition, especially blessed by our patron saint.

The Tolka boasted of another spa, in a field near Drumcondra Bridge. About thirty years ago it was brought into note by an enterprising dancing-master named Duval, the builder of the house now called Clonturk House, in the lawn attached to which the supposed spa water was drunk. If spas had half the virtues ascribed to them, every citizen of Dublin might rival old Parr in longevity. In 1732 another spa was opened at Templeogue, near the bridge over the Dodder. Rutty enumerates no less than eleven spas in the city, and others, at various times, obtained celebrity at Goldenbridge, Leixlip, in the Phœnix Park, and at Lucan. With the exception of the two last, they are all now forgotten, and the Lucan spa alone is seriously used for medicinal purposes.

Descending the river from Finglas bridge, we come to the classic neighbourhood of Glasnevin—Glasseeneven, "the pleasant little field"—once the residence of Steele, Tickell, and Delany, and the occasional resort of their illustrious friends, Swift and Addison. Close to the bridge there stood till a few years ago a round house, with a conical roof, which looked like a squat Esquimaux variety of one of our genuine Irish round towers. That odd building was an inconvenient parish schoolhouse, built by the good-natured and hobby-horsical Delany; it was his little whim. If the reader raises his eyes, he will see at the top of the hill a high roof, and four staring windows appearing over a dashed wall and a large wooden gate, the ascent to which is a continuance of the village street, straight up the steep hill. This was the doctor's great whim—the far-famed Delville, designed and named by philosophers, ridiculed and immortalised by wits and statesmen. Here "the Dean," the first of Ireland's patriots and of England's wits, had often met the affectionate friends with whom he loved to mix, when "the cold weather gathered together Dr. Delany's set." Here he thought, and wrote, perhaps printed, some of his bitterest invectives. Dr. Delany was a Fellow of Trinity College, who lived here till near his death, in 1768, at the ripe old age of 83. He is buried in the church-

yard of Glasnevin, his monument adjoining the boundary wall of his favourite lawn. Not far from his tomb the remains of another Fellow, the eccentric "Jackey Barrett," repose. Delany had also some preferments in the Church. But whether it was that his Fellowship was not profitable, or that the purse of men of his disposition is as impossible to be filled as the tubs of the Danaides, he was still a struggling man; and this same house, and his passion for building and beautifying, was no small cause of his embarrassments. In 1729 he wrote his well-known "Address to Lord Cartaret," and he sums up his wishes in a distich which gives a prominent position to his hobby:—

"My lord, I wish to pay the debts I owe;
I'd wish beside to build and to bestow."

The address was unsuccessful; but in 1735 he was made Dean of Down, and in 1743 he married his second wife, Mrs. Pendarvis, a widow with a fortune. These accessions to his means enabled him abundantly to satisfy the two last wishes, though their gratification prevented him from ever attaining to the first. The address, if it did not gain him promotion, procured for him abundant notoriety; and a war of squibs was waged, in which Delville forms a favourite topic. The "Christmas-box for Dr. Delany," evoked "An Answer to the Christmas-box." Delany is described as:—

"Quite ruined and bankrupt, reduced to a farthing,
By making too much of a very small garden."

. . . . .

You, forsooth, your all must squander
On that poor spot called Delville, yonder."

Swift's mock description of it concludes thus:—

"In short, in all your boasted seat
There's nothing but yourself is great."

When the villa was finished, its position, on the top of the hill of Glasnevin, looking down upon the city of Dublin (of which, by the way, it commands a very striking view), suggested the motto, still legible in a small temple in the grounds, "Fastigio despicit urbem." The same punning propensities suggested the name of Delville. It was planned by Delany himself, in conjunction with his friend, Dr. Helsham; and as a memento of their joint labours it was christened with the first syllable of each of their names—Hel-Del-Ville; but, as the commencement of this name suggested uncomfortable associations, it was soon dropped.

Many years ago in removing some old lumber from an out office a concealed printing press was discovered, which is supposed to have been used in printing the "Legion Club." This ferocious satire was printed by Swift in 1736, and he passed the summer of 1735 at Delville. Twice before, Swift's printers had been endangered for printing his pamphlets—once for "The Public Spirit of the Whigs," in 1714, and, ten years subsequently, for the fourth "Drapier's Letter." These publications were comparatively mild. The mad virulence of the "Legion Club" naturally frightened any Dublin printer from venturing openly to publish it. The tradition that Swift printed it privately at his friend's, is therefore not without probability. In the small temple before referred to there is a medallion likeness, still in tolerably good preservation, of Mrs. Johnston, the celebrated Stella. It has been engraved, with some other likenesses of her, in Wilde's Notes on Swift. The portrait at Delville present a less pleasing impression of her personal appearance than the others.

It is impossible to visit Delville—to see its many old-fashioned rooms, its temples and terraces—without fancying its old proprietor and his friends before us. Delany's simplicity and vanity; his almost childish gratification at Swift's praises; his sincere veneration for his friend; his unsophisticated ignorance of the world, and voluntary exposure of himself to ridicule; his innocent, though absurd self-conceit; his constant hospitality, and no less constant pecuniary embarrassments, form a character so distinct, it is easy to summon the picture of the man who was always in debt; who got from his friend the Dean a recommendaton to Bolingbroke of a rogue; and who, after soliciting the honour of preaching before George II., came late to the church, and threw the service into confusion, from his neglect of the usual forms:—

"Let the Dean say what he will,
Delany, you're Delany still."

It is less easy to realise the eccentric character of the great Irish patriot—the vigorous and original genius, who truly boasted that he never borrowed an idea; who, without a model, has been without a rival; who, like Lorenzo de Medici, unaided by the weight of office, was courted by the most powerful of statesmen and swayed the most important councils of the nation; whose pen determined the peace of Europe; whose daring courage evoked from the death-like stillness of Irish subserviency the first healthful breath of independence; whose versatile powers could shine in the most childish trifles; whose fastidious dirtiness could revel over the most degrading necessities of every-day life, and whose reforming mania descended to the wants of a cobbler and the duties of a kitchen-maid. Yet the host and the chief and most frequent guest at Delville, are not the only characters that stand prominently forward in Glasnevin society. The tasteful Parnell, who, as before mentioned, was vicar of Finglas, often figured in the circle. Tickell "Whiggissimus," as he was nicknamed, another poet of no mean pretensions, was proprietor of the premises now occupied by the Botanic Gardens. Here, too, was seen the brilliant pertinacity of Steele, then proprietor of Hampstead, immediately adjoining Delville. Occasionally a Whig more illustrious still appears. The awkward shyness of the elegant, but too frugal, Addison mixes with the scene, and the great luminary of the Whigs is pictured chatting with the giant of the Tories. Nor are we to forget the sprightly trifles and droll extravagance of the elder Sheridan; Helsham, Stella, Mrs Delany, and many others now forgotten, but who then made no obscure figure in society, fill up the crowd. How different was the intercourse of Boswell and Johnson from that of Swift and his friends Delany and Sheridan! How pleasing their intercourse, contrasted with the mean subservience of the Prince of Toadies to his ponderous idol! With every wish to paint the amiable side of his character, Boswell exhibits to us a selfish, overbearing tyrant, crushing all opposition to his own opinions or prejudices. We see Swift, on the contrary, courting a return of the blows he gave, and good-humouredly entering the lists in the war of trifles which his friends excelled in. Yet, strange to say, the popular impression generally recurs to the good-nature of Johnson and the moroseness of Swift. It is not more strange than that the former should be held up as a model of austere virtue, though Boswell confesses, with pain, his Eastern sensuality; while the latter, whose chastity was his crime, is quoted as the great master of ribaldry and grossness.

But the by-gone days of Glasnevin will lead to endless digressions, if we indulge these fancies. It is now a declining village, and, like its neighbour Finglas, mourns over the fickleness of fashion. About fifty years ago, Finglas was described (in Archer's Dublin) as a "large and handsome town." Even then (1801) the neighbourhood was decaying. Glasnevin, until nearly the same time, had a considerable tavern, a celebrated resort of Dublin citizens on Sundays. Finglas is now but a single street, of ruinous, beggarly houses, and but few of them. The large mansions have long lost their titled proprietors, and are either converted into lunatic asylums, or left as desolate as their humbler neighbours. The modern predilection of the citizens of Dublin for the sea has, in a great measure, caused this. But the neighbourhood had a worse evil to contend with—the curse of turnpikes was upon it.

Before leaving Glasnevin the reader should visit the National Institution at Claremont, for Educating the Deaf and Dumb. Immediately above the bridge the river is bordered by the Botanic Gardens of the Royal Dublin Society on one side, and at the opposite side by a demesne which was once one of the "show places" of Dublin, belonging to a gentleman named Mitchell. It was some time since occupied by the "last" Bishop of Kildare, with whom the see was extinguished. It is mentioned as an incident connected with Christ's Church, the deanery of which was attached to this see, that it was built by the first Bishop, and rebuilt by the last. He was an amiable man, but excited some popular dislike by establishing a large dairy, of which he sold the milk. He was then christened by the dairy boys "the buttermilk bishop." He once got into personal collision with a drayman, who was at the wrong side of the road, and a caricature was published of him as "the boxing bishop."

The Botanic Gardens are on the site of the house and demesne formerly occupied by Tickell, the poet. He first came to Ireland in 1714, with his friend Addison; but in 1725, was himself made Secretary to the Lords Justices. He married in 1726 a lady who was a native of Dublin, and soon afterwards settled at Glasnevin. The house which he occupied is still standing, and the ornamented ceiling of the room used for lectures in botany is said to be his own design. He is supposed to have here composed the pleasing ballad of "Colin and Lucy." There is a walk between yew trees, called Addison's-walk, in the gardens, which is popularly said to have been planted by Addison himself; but as Tickell did not go to live there until 1726, and Addison died in 1719, that is not likely. The walk was probably named as a tribute of affection from Tickell to his friend. The lands were purchased by the Royal Dublin Society, in 1795, from Major Tickell, a member of the poet's family.

It is an odd coincidence, that the publication of the first work on Irish botany was contemporaneous with Tickell's own acquisition of the place. In 1726, Dr. Threlkeld published his "Synopsis Stirium Hibernicarum," which was the first modern attempt made to illustrate the flora of this country. The origin of the garden is due to the zeal and energy of Dr. Wade, backed by the strenuous assistance of Mr. Speaker Foster (Lord Oriel). In 1790, Wade drew up a petition, which was presented to Parliament by Mr. Toler (Lord Norbury), and out of the sum then voted to the Dublin Society £300 was allocated towards the foundation of a botanic garden. Additions were made in the following years. Among the grants proposed in the last session of the Irish Parliament, in 1800, one of the few devoted to a meritorious object was the large increase of the vote to the Dublin Society, of which £1,500 was appropriated to complete this garden. The grounds include thirty acres. Though the first botanic garden was established so late* in Ireland, the management of the institution has made up for the delay. In beauty of situation, and taste in their arrangement, the gardens at Glasnevin are unrivalled, and, in a scientific point of view, the collection is most excellent.

(To be Continued.)

According to a French contemporary, a good, simple test for the poles of an electrical apparatus is a slip of ferro-prussiate paper moistened and held on the pole. The negative pole makes a white mark on the paper, which, by the way, is the same as that used for making copies of engineering designs, where the lines appear on a blue ground. Old blue diagrams of this kind cut into slips will serve as test papers.

---

*The earliest establishment of this kind in Europe is said to have been the garden at Padua, opened in 1540, under the auspices of the Medici. In the next century, similar establishments were set on foot in different parts of Great Britain and the Continent.

OUR WEEKLY STORY

THE KINGSLEY AFFAIR;

OR,

HER BROTHER'S DOWNFALL.

A REPORTER'S STORY.

By Susan Keating Glaspell.

Nine o'clock can never be counted a time of play in the local room, but to-night the tension seemed unusually strong. The clink of the typewriters rang monotonously in the city editor's ear as he relaxed long enough to run his nervous fingers through his hair and tell himself the morning issue ought to be a good one. Not for a long time had the seething mass of comedy and tragedy aggregated by the humanity of the big city been as varied or as lurid. It was gratifying, as well as a little refreshing, at this hour of night to think it all over and tell himself he had covered everything well. The usual run of stuff, another fight in the council, a hot political story, and then the best story of the day, best story of many a day, that unexpected and altogether sensational Kingsley affair.

"That's what they'll want in the morning," he murmured soothingly to the fierce Indian head that always stood guard in front of him, "that's what they'll go after like hot cakes. One of the star family of the town arrested for forgery, those don't come our way every day."

And then with a small grunt of satisfaction he confided to the barbaric but sympathetic chief that he wasn't afraid to match his story against any the town could put out. "They can't beat it," he said with an assuring nod, "not one of them."

For all that he was not just satisfied with the story. It was a good straight story, as good straight stories go, but it might have been made more human. To make it just right the boys should have gotten it out at the house and coloured it up with a little of the inside atmosphere. As he saw it now that should have been made the feature of the story. He was so sure of it that he hated to give it up even at this late day. It was one of those rare opportunities, and he had men who could write it, too.

Then he brought his fist down on the table in a way that made the red chief tremble. "That's just it," he said, "ought to have thought of it before."

He beckoned sharply to a small boy who was deeply engaged in constructing a domicile of copy paper. "You run over to the Masonic Temple banquet room," he jerked out, "and tell McMasters to come here on the jump."

The boy grinned appreciably, and made his exit with more speed than grace. The city editor made another attack upon his hair and stared fiercely at the unoffending chief. McMasters was the cub reporter of the shop. He had only been there a couple of months, and so far had not done anything sufficient to raise himself from cubhood. Before he was reduced to a newspaper office he had been the pampered son of a millionaire. The millionaire father went down one day and the reporters said McMasters then entered the "journalistic field" looking for an easy and elegant life. They snubbed him accordingly, but the city editor thought he saw something in him, and so let him stay on.

He had it pretty well thought out when McMasters arrived, looking breathless but important. He swung round in his chair and looked him all over.

"You have a pull with the Kingsley's, haven't you?" he asked.

"I have an acquaintance with them," said McMasters with some surprise.

"About the same thing. You know Margaret Kingsley pretty well, I suppose?"

"I used to, fairly well."

"Well, then I've got an assignment for you that will give you the best chance you've had yet. I want you to go to Kingsley Place and have a talk with Miss Kingsley. You can tell her you come as an old friend to get the story as they want it printed, and I am inclined to think that will make her talk all right. It's the personal side you want, you know; we have all the rest. I've been reading the story over and I see we want more of the human in it; I believe we ought to have a new lead. It will be sombre out there at the house, and you ought to be able to picture that up a little, and then anything Miss Kingsley may do or say can be used as good stuff. They tell me she's the society girl of the town. The great thing now is to hurry for your life; better take a cab. If you can get just what I want it will be a mighty good thing for you."

McMasters had learned that cub reporters are not supposed to enter demurs to their city editors; but while he was being driven at a reckless rate to Kingsley Place, he fell to thinking of how he liked his assignment. He saw vaguely there was a good story in it, but underneath it all he was uncomfortable about the position in which it placed him personally. There was a time, and not long ago either, when Margaret Kingsley and he had known each other as persons of the same set. She would remember that, and probably receive him, although refusing all other newspaper men of the city. He then, availing himself of the confidence reposed in him as a gentleman born and bred in her world, would lay before a hundred thousand or more people what emotion she might display in speaking, to an old friend, of her brother's downfall. It sounded ugly that way; it seemed like resigning everything he used to think was best in life because he had been forced to resign money and position. He tapped nervously on the window pane—it was making capital of an old friend, and a girl at that. He was still Fred McMasters, if he was a newspaper cub trying to earn a living, and he half rose to order the driver back. But he did not; he only sank back into his seat and told himself this was a poor time to begin playing the baby. He tried to face the other side of it and to contend he should have shaken off his highly developed notions when his father went to the wall.

In the days when he drew a bigger allowance than any fellow in college it was all well enough to look out for the finer side of situations. But he was not a college man, or a swell, just now. He was a newspaper reporter, with a duty before him, and Margaret Kingsley's feelings were nothing with which he need especially concern himself. She and her kind belonged to the very much dead and buried past. Frequently he saw her riding down the avenue, looking like a young queen in her dashing trap, and several of the old boys he kept in touch with a little gave him glowing accounts of how she shone at dinner parties, but other than that her brilliant light had passed clear out of his busy life.

The cab stopped, and he ran hurriedly up the stone steps. As he stood there awaiting the answer to his ring he thought of the times in the old days, the good, happy-go-lucky old days, when he stood before that magnificent entrance. Life was a queer sort of a twist, and it was not easy, he thought, to foresee situations. He remembered Margaret's coming out party. It was in holiday week of his sophomore year, but it all came before him as something that had happened but yesterday. Then there were the dozens and dozens of times he had come home with Bob. He had always been treated well at Kingsley Place. As he thought of it now it seemed he had been treated unusually well. He rather wished the idea had not occurred to him so forcibly just at that moment.

The door opened; the lights in the great hall were dim, and there were shadows everywhere.

"Miss Kingsley is not receiving this evening," said the servant, taking the card doubtfully.

"I wish to see her on a special matter," McMasters answered quietly, and then he stepped into a little reception room on the right that he knew of old. The air seemed heavy, and he walked restlessly about while he waited. In a moment the man returned. "Miss Kingsley asks to be excused, she is not seeing anyone to-day."

"Just one moment," said McMasters. Quickly taking a card from his pocket he wrote upon it, "It will be better for your brother that you see me," and handed it to the servant, saying: "Now if you will take this, please."

The man hesitated. "Miss Kingsley does not wish to be disturbed again," he said uncompromisingly.

"The matter is important. You take it and I'll answer for the results," said McMasters, and his easy assurance prevailed.

Again he waited nervously, but when the man appeared the second time it was to say, "I will show you up now." And so he followed down the sombre hall and up the imposing stairway. It was all so quiet and depressing, so sadly different from the other times he remembered when music and flowers and richly-dressed women made it aglow with life and beauty. A large chrysanthemum in a jardiniere on the stairway was hanging its regal head in a suggestive human fashion, and the first thing he saw upon reaching the upper hall was Miss Kingsley's much petted poodle crouching drearily beneath a cold looking statue.

The man led him to the extreme end of the hall, and when the door opened he found he was standing in Bob's den. Things were scattered about, in Bob's characteristic disorder, and it brought the old days back so strongly that he was half-surprised when he saw it was Miss Kingsley instead of her haphazard brother who was coming towards him.

He had never seen Margaret Kingsley look like that before. She was trying hard to hold her head high and seem composed; but instead of the girl of the world he had known, she looked like a broken-hearted child that had been sobbing its heart out all by itself. McMasters felt something coming up in his throat as he took her hand impulsively in his, and said in what could not be called a business-like voice:

"I'm so sorry, Miss Kingsley, so very, very sorry."

"I know you are, Mr. McMasters," she said, and the big tears were running down her cheeks now, "I know you liked him, and I know how much he always liked you. I didn't want to see you at first, I haven't seen any one to-day, but I am glad now that you

came. You were always a good friend to Bob, I haven't forgotten that. There's nothing you can do now, though, it's too late for any of us to help Bob now."

She stood there for a minute, her whole face quivering. Then she turned with a heavy sob to the couch behind her, and McMasters saw she had buried her head in the big bear-skin that had always been Bob's special pride, and was crying as he had never supposed a girl like Margaret Kingsley could cry. McMasters sat there looking silently about the room, and thinking of the things that had come to both of them, and above all to Bob, since he had been there before. He was not sure that he was not crying a little himself; it was awful to see a girl like Bob's beautiful sister broken down that way. It was she who spoke first.

"It's all my fault and not his, Mr. McMasters," she said, her face wet and her voice trembling. "You know him so well, and you know how it is here at home, can't you understand how it happened, and how it's my fault instead of Bob's?"

He did not answer, and she went on in a voice so low he could barely hear; "my mother died eight years ago this month, Mr. McMasters. The last thing she said in this world was to ask me to be good to Bob. She told me to take care of him just as she would, and not let anything happen to him. I told her I would, but you see I haven't done it; mother told me to, but I didn't do it. I meant to, I did try to, but I've been too busy since I been going out. I left Bob to take care of himself, and—and, this is the end of it."

She was crying again, and McMaster said as soothingly as he could: "Don't talk like that, Miss Kingsley, it would make Bob feel awful. I have never seen a brother think as much of a sister as he does of you. He wouldn't let you blame yourself if he was here. I have heard him say a hundred times that you were both mother and sister to him."

But he could not comfort her. "I have not been enough," she moaned, " or he would have come to me. I know he would have gone to mother if she had been alive. I would have done anything in the world for him, and I guess Bob didn't know it."

It had been a long time since McMasters had seen such suffering as this, and he little thought to see it in Margaret Kingsley. He had come as a newspaper man, and she was pouring her heart out to him as Bob's friend. He could not bear to let her see. She had no mother, and her father was worse than stone. She had to tell it to some one, and she was telling it to her brother's old friend.

She had pulled a bit of paper from her belt and was holding it in her hand. He sent me this this morning, Mr. McMasters; this was the first I knew. I am going to let you read it because it will make you think better of Bob, and it will help me to know there is someone who understands and will say a good word for him when all the rest are saying everything bad."

She handed him the crumpled bit of paper. He looked at her strangely; yes, she had entirely forgotten, she was talking to Bob's old friend. The note was written in pencil, and so many tear drops had fallen upon it that he could barely read. Slowly, and with tears in his own eyes, he made out the words:

"My Little Sister—Something awful is going to happen; Maggie and I want to write you about it before the rest of them tell you. It is all my fault, but it is going to make you suffer, too, and that is the awful part of it. I do not know how to tell it, sister; it is not easy to tell, and I am afraid not even you will understand it just as it is. I had to have some money, and I got it in a wrong way. I did not think at the time about it being very wrong. I intended to pay it all back, and I didn't think it would hurt anybody. You know I wouldn't really steal or cheat, don't you, Maggie; don't you know I never did it in all my life? I do not expect any of the rest of them to stand by me, but maybe you will, you always have. It will make it easier if you do, for I'd rather have you than anybody else in the world. You have been such a good sister to me, I'd rather die this minute than bring this on you. Be brave as you can, and try and be happy without any brother Bob monkeying around. Maybe it will come out right some day after all. "BOB."

McMasters folded the little paper almost tenderly; he knew what it meant to the girl. Another thought flashed upon him just then, he knew what it would mean to the city editor. He put that resolutely away, and said as he handed the paper back:

"Thank you for letting me read it, Miss Kingsley. It sounds like Bob, and I think I can see how it all happened, and what the boy has suffered. You may be sure I will say all the good things in the world about him every time I get a chance."

She had risen, and was looking at him wistfully. "Maybe you can help him some?" she said. "I do not understand those things very well, but in your position maybe you can. He will need all his friends, you know."

She looked so worn that he thought he must go at once. He tried to say a few things to help her, and she seemed grateful. She told him again to be good to Bob, and then she said good-bye. He left her sitting there alone in Bob's old den, with the poor little worn note in her hand. She had trusted him unquestioningly, and had taken some small comfort from the thought that he was going to stand up for Bob.

He went down the splendid stairway, out through the long, quiet hall, and closing the great door heavily behind him, started for the office. The wind came cuttingly, and he shivered from head to foot. He was not dressed warmly, and that made him think of how badly he needed money and how ambitiously he had longed for promotion. He let himself think for a minute of what he could do if he threw off personal feeling, but when he tried to formulate the story he saw only the picture of that sobbing girl with her face hidden in the bear-skin rug, and her brother's crumpled note in her hand.

He had been unconscious of the people he was passing until the name Kingsley fell on his ear. He turned in time to hear a jarring laugh and the words: "It will go a little hard I fear with the haughty Miss Margaret." As they passed under the street light he recognised them; they were men whom it was generally supposed were warm friends of the Kingsleys. He leaned against the building for a moment, looking back at them. Miss Kingsley was right, they would need their friends, every one of them.

He had a block to go before reaching the office, and he went in quickly. He burst open the door and cleared the steps three at a time, never thinking of an elevator. The city editor turned expectantly as he heard him coming.

"You got a good story?" he asked.

Several of the reporters were sitting there, and they, too, looked up as they waited for his reply. He grew very red as he answered in a slow, steady voice:

"No, I'm sorry, but it was so I couldn't get a thing.' '

There was a peculiar noise from one of the reporters, and the city editor turned sharply back to his desk. McMasters thought of the little piece of paper, but he did not speak.

"Do you mean to say," asked the city editor, wheeling round again, "that after this long absence there is absolutely nothing on the story you can write?"

"I am sorry," answered McMasters, "but that is just it."

He waited a minute and then asked: "Is there anything else for me to-night?"

The city editor looked him all over in his queer way. "No, Mr. McMasters," he said, "I think maybe we can pull through the night without you."

There was another strange noise from the reporters, but McMasters did not look that way. He turned and started down stairs. "Still a cub," he muttered, and then with great vigour he began to whistle.

NOTES AND QUERIES.

UNIQUE BOOKS UNKNOWN TO BIBLIOGRAPHERS.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Dear Sir—The "Recording Angel," the Bibliographer, up to the appearance of my friend, the indefatigable Mr. E. C M. C. Dix and his coadjutors, has given little attention to Ireland and her books. True, Belfast had been fairly well done previously. Mr. Dix is gradually laying the foundation for bibliographie of Dublin, Strabane, and Armagh. It is to be hoped that friends will help for Cork, Waterford, Limerick, Galway, Ennis, etc., etc.

England's books are well recorded, and Scotland is quite to the front at present. The Bibliographers of France may be considered cosmopolitan in their works, and Germans have done most accurate work for the Fatherland. Holland's Bibliographers have always been steady and accurate. Of the Elezenir Presses, for instance, very few would venture to assert that a single Dutch printed book escaped the Dutch and French Bibliographers. But is this so? My assertion as to the book (4) which I give in this letter, refers to the publication of it as an Elzevir only. It may be found in the collected works (of a much later date) of this author.

(4) Joannis Meurs I. Lectionum Libri VI. In quibus Antiquitates plurime, nunc primum in lucem erutae preferuntur.. Lugduni Batavorum, Ex. officina Elzeviriana Colophon.—Lugduni Batavorum, Typis Isaaci Elzevir I. Anno. 1617..

Instead of the Sphere, Isaac Elzevir, at this period, used the Eagle with the motto, "Concordia res parvae crescaut." The beautiful large Roman, Greek, and Black Letter Types produce a remarkably pleasing impression on the eyes of the Book-Lovers, three great ones of whom confess it, by writing their names on the title. The great Dutch archæologist and historian, John Meursius, father (Jo. Meursius, pater), was well appreciated in his day by the judicious, but fell foul of the Dutch politicians for telling the whole truth. He is well handed down to posterity in this most beautiful Elzevir, now lying before me, with its side and bottom margin of nearly two inches. Collation.—Title 1 p., Dedication "Viro magnifico Jacobo Dyekio, 3 pp., Benigue Lector, 1 p., Errata (one only) 1 p., Text 376 pp., Index 32 pp.

No other such fine copy of a 4to. Elezevir, I am certain, exists.

JAMES HAYES,
Bookseller, Ennis.

DUBLIN CITY TOWER.

Isle of Man.

In the "Dublin Penny Journal" of 17th inst, it is stated that the above, or Brown's Castle, was near the Marshalsea, commonly called the Black Dog, from the sign of a Talbot hung up there. I would be thankful to be informed what is meant by a Talbot.

W. M.

From Chamber's Encyclopædia we take this answer to our correspondent's query:—Talbot, a kind of dog, deriving its name from the family of Talbot, who had a dog in their coat of arms. The Talbot seems to have been the same as that also called the St. Hubert's breed, the oldest of the Slow Hounds, and perhaps the the original stock of the Blood hound.

OLD STONE MONUMENTS.

DRUID CIRCLES, CROMLECHS, Etc.

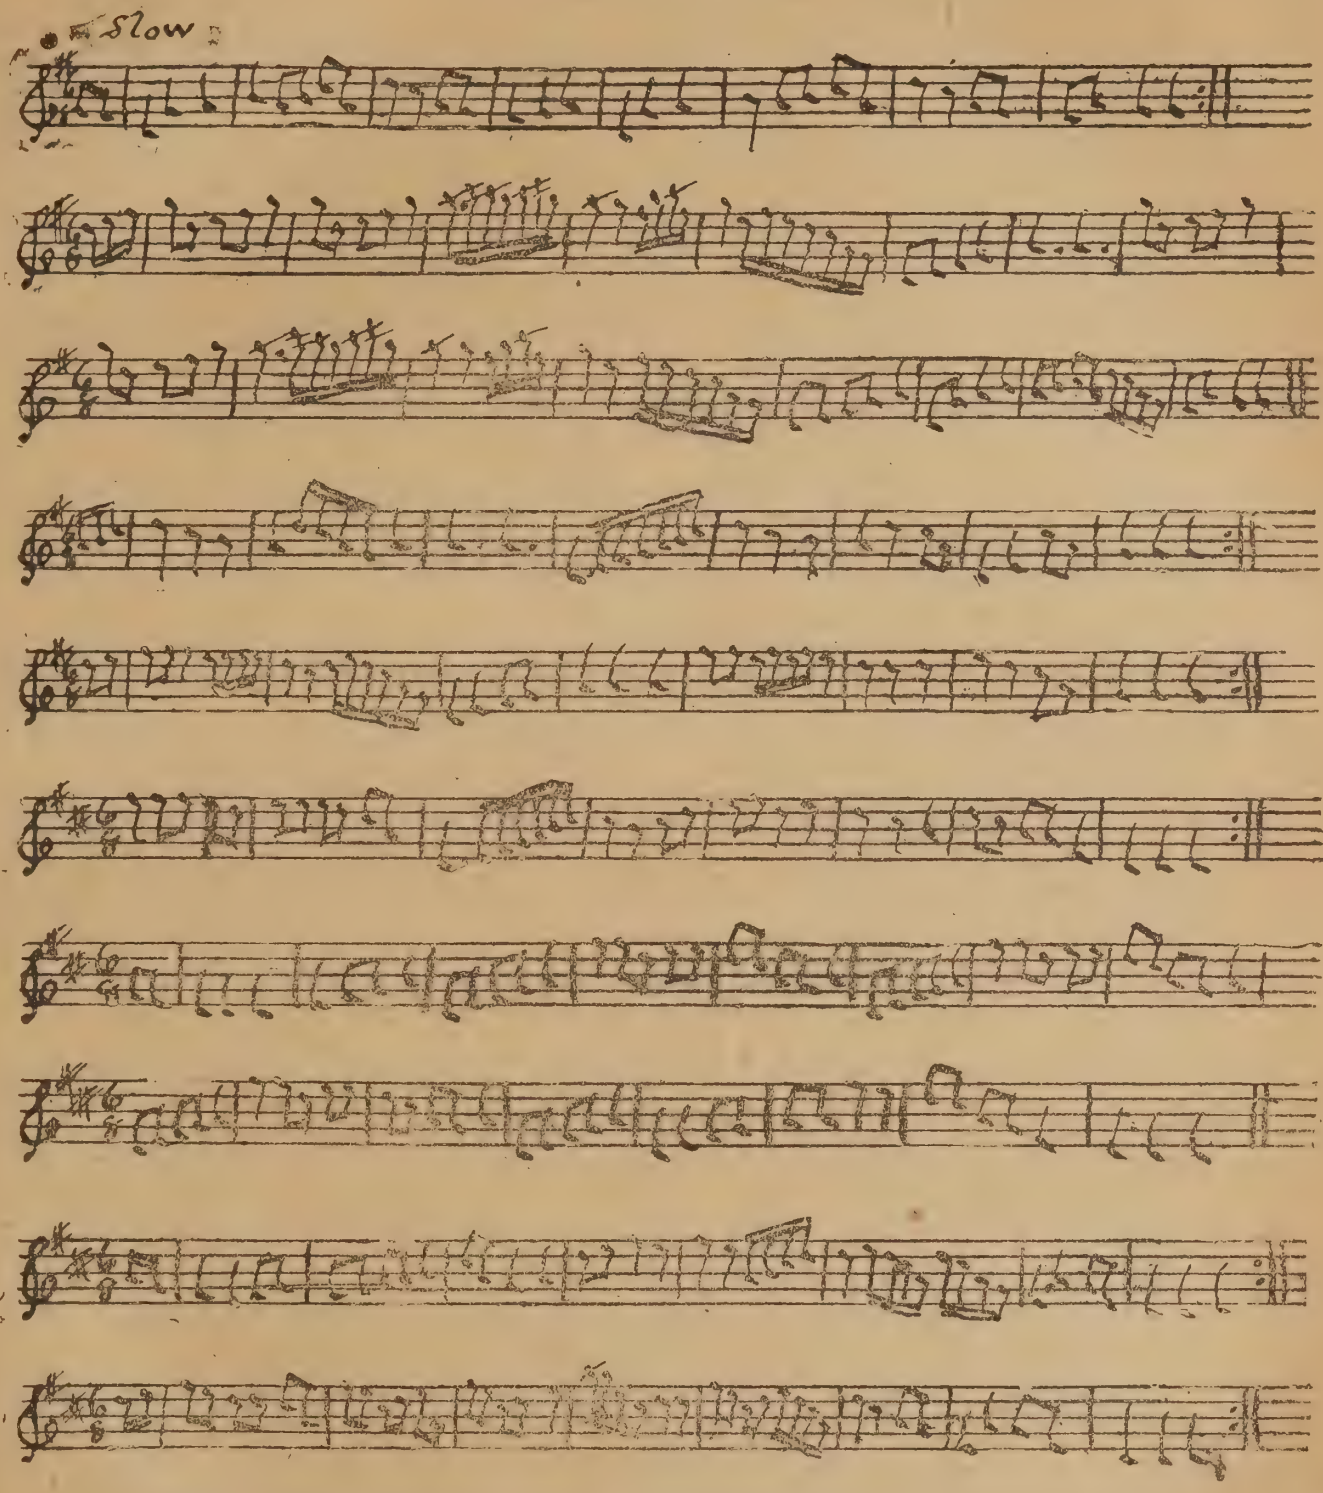
By Rev. J. F. Lynch.

A single holiday does not admit of seeing everything, and the traveller who is going on into Cornwall will find moors enough before his distant journey is completed. We pass by, therefore, all the tempting routes which might be followed from Lydford, and return towards Tavistock, whence we shall make for Launceston, and so leave this lovely county, which has surely not its equal either in beauty or in memory of famous men. But before we go it is right to say something very briefly of those ancient stone monuments, the circles, and the avenues of winding stones, which must have stirred a temporary interest in the most careless traveller, while to the enthusiast they offer a problem knotty enough to occupy his utmost faculties during something more than the brief span vouchsafed for life on earth.

Here and there, in lonely places on the hillside, there are circles traced upon the grass—let us call them cromlechs, as the archæologists do, or ought, for they are not always of the same mind about their terms, the enclosure being formed by large upright stones placed at even intervals, the blocks for the most part of regular size, and tracing such a perfect circle as to prove that those who built them were not ignorant of science. In the days when these stones were set up—we know no more than that they were immensely distant from our own—vast labour must have been expended in moving them without cranes or pulleys, and as men do not take great pains save in the pursuit of some great object, it is clear that these cromlechs stood in some close relation to the inmost life of a long vanished people, and that if we could know certainly to what use they were put, we should have sent a strong and vivid ray of light through that darkness of the past which has so many secrets yet to yield.

There are many parts of Great Britain, and also many other countries—France, Moab, India—in which these cromlechs still stand as if to taunt us with our dulness; but on Dartmoor they possess one feature which is almost peculiar to the district. Wandering away from many of the cromlechs, there radiate rows of little stones, sometimes single, sometimes double, continued for great distances, in one case for as much as two miles, and ending so commonly in a menhir, or tall, single stone, as to give colour to the idea that this was the regular plan, and that these rows are ruined or imperfect, which do not end in this way. Sometimes the cromlech is built around a barrow—that is, a mound over what is certainly a grave—or at least encloses one, and so mound, circle, avenue, and distant menhir constitute a relic of old days, which can hardly be looked upon without a throb of curiosity to know what it meant, and in what age the people lived who held those faiths and fancies which are worked out in stone at the cost of such toil and labour.

We are here in presence of an antiquity so remote that the age of those which we call ancient things is as nothing when beside them. Rome was not built, Troy, perhaps, was not yet burnt, when the oldest of these stones were set up on the Devon hillside; and it may be that in ages far earlier than those the rites were practised for which these hoary enclosures were designed. It is strange that even in Devonshire and Cornwall where the legends are so very plentiful and ancient, bringing down to our own day, however mutilated, many a fragment of forgotten truth, there is not one which sheds even the faintest ray of light on the origin of these monuments; and that these very conspicuous objects should be left practically untouched by a cycle of traditions which records in its dim way so many very ancient things, gives them a strange aspect of detachment from all we read or learn, and from all the peoples, Saxon, Briton, Celtic, whose blood we know to mingle in our own. Of almost all things else, when we question the past some whisper comes in answer, some faint voice which can be heard by straining ears. On these things there is deep silence. Their use is forgotten, even by legend, which forgets so slowly, and she can no more divulge their origin than she can tell how the granite tors were fashioned out of molten rock, or the river valleys cut down deep and hollow by the running water.



Of course there are in existence names given to the cromlechs in ages possibly very distant, and even stories which relate to them; but they betray at once their origin in the brains or fancies of a people who know no more of the true use of the stones than we ourselves. The cromlechs are dubbed "Grey Wethers," or "Hurlers," or "Nine Maidens"; and the rustics tell you they represent people who danced or played the ancient game of hurling on a Sunday, and were turned into stone as a punishment. Similarly the dolmens, or chambered tombs built above ground, so much more plentiful in Cornwall than in Devon, are "Giants' Quoits," and there is generally some tale explaining how the local giant, Bolster, Cormoran, or another, hurled the huge flat capstone from some inconceivable distance. So that the riddle was already a good deal perplexed by obviously modern nonsense when certain very learned persons in the middle of the last century perplexed it infinitely further, and sent several generations of honest inquirers off upon a wildgoose chase by declaring that all the old stone monuments were the work of Druids.

Never did an utterly baseless notion obtain wider currency. Druid judgment seats and places of assembly were discovered in wild profusion throughout the West. Druid groves were recognised where no one previously had suspected anything more remarkable than a simple oak-wood. Countless pages of eloquent description were written upon the rites of this long-vanished priesthood. The very children took the new idea up; and to this day, if you question a West country peasant concerning any one of these remains you will probably receive an answer in which the Druids figure largely. So men amused themselves for the best part of a century; when, having succeeded in driving into the mind of the general public the idea that Druids built the cromlechs and the menhirs, they at last set themselves to inquire what the evidence was for any such belief. The moment this question was asked the whole fabric of imagination tumbled down. It had absolutely no foundation. It served no other purpose than to hide the truth; its debris embarrass more sober reasoners to this hour; and it need only be added that a scientific inquiry into the perplexing subject is hardly older than the present generation. Recent as this inquiry is, it has already rendered some results of the very highest interest; such as tempt me sorely to dilate on them. But prehistoric archæology is still a battle in which he who engages must be prepared to join the fray and use his hands, well armed with scientific bludgeons to keep his head, which is else like to be broken. There is no place on that field for peaceful tourists. We shall do better to keep the ring; and catch what plain words we may hear emerging from the strife of tongues. Some day all will become clear. Archæologists will be patient of each other's views, and agree, at least, upon some small details. But till that happy time shall come, I know of no conclusion more deserving of attention than that put forward by Mr. Worth, not solely as his own, but as resulting from the work of a group of very able men, whose toil he shared. "Devon," wrote this careful inquirer, "shows us that we are more likely to err in bringing down the date of these memorials than in carrying it back." And he proceeds to say that on Dartmoor the cromlechs are clearly of the same age as the old hut dwellings which are found here and there upon the moor. If, then, the age of the huts can be determined, a real step will have been gained.

Now the huts have been carefully dug out, and the discoveries made therein prove them to have been the dwellings of a people who did not know the use of metal, but fashioned their arms and implements of stone. From this it follows that the cromlechs have stood where we see them now, not only through the nineteen centuries or so which our English history runs, but also during the whole of that period known roughly as the "Bronze Age," because there is no better measure to apply to it. And how long was that? Why, Mr. Borlase puts its best period at about ten or twelve centuries before Christ, and its commencement, of course, some centuries further back; while Mr. Worth, reasoning on certain facts connected with ancient stream works in Cornwall, suggests a mode of calculation which throws back the commencement of the Bronze Age at least 1,500 years before our era. Before so great antiquity one hesitates and fears to take the figures. It is very strange to find ourselves confronting monuments which looked just as they do now when Homer lived, and were already ancient when the first walls rose on the Seven Hills of Rome. We think of these islands as peopled in those days by mere barbarians. We must learn to understand that civilisation of a sort is immensely ancient, and that our small faculties have no right to set up limits of what was possible in the early ages of the world. Many dynasties and races have looked at these stones with wonder and passed on into the night of time. Is ours the last of all that long procession? There are such numerous remains of this nature in Cornwall, whither we are going, that it will not be possible to avoid speaking further of them; and therefore I shall leave the subject for the present, merely remarking that it is not to be supposed that every old stone monument bears the vast burden of centuries which is ascribed to the cromlechs and the rows. The dolmens are in many cases much more modern, extending down into the Bronze Age; and of the barrows there are some which are not earlier than the first years of the Christian era.

The above disquisition is taken from "Highways and Byways in Devon and Cornwall," by Arthur H. Norway, and it puts before the reader very lucidly the important question concerning the stone monuments from an English point of view, but it is to be noted that Mr. Norway makes no reference to the stone monuments of Ireland, and when he tells us that concerning the stone monuments there is no information from the past he is not correct. The old names of numbers of the rude stone monuments of Ireland have survived to our time, and all we have to do is to determine by means of the mythology the character of the personage whose name has been connected with the monument, and then we shall be able to define exactly the reasons for which such monument was erected. Outside Ireland I do not think that the original name of even one stone circle has survived, but there are such survivals in Ireland.

THE BANSHEE'S WAIL.

MUSICALLY NOTED BY Mr. JAMES BUTLER, LOUGH GUR.

THE BANSHEE'S WAIL.

Lough Gur, Holycross,
Kilmallock, Co. Limerick,

TO THE EDITOR DUBLIN PENNY JOURNAL.

Dear Mr. Editor—I enclose music of "The Banshee's Wail," written by Mr. James Buttler, of Lough Gur, who says it is to be played in the Key of G, but towards the finish the "wail" softens down to the Key of D. The wail is traditionally supposed to be caoined from the summit of Carrig na Galour at the time of the burial of the great Irish minstrel-bard, Thomas O'Connellan. The Rev. J. F. Lynch, who has done more in elucidating the long-lost history of Lough Gur's antiquities than any other historian, past or present, believes that Aine, the celebrated Tuatha de Danaan princess of Knockaine, is the Van Caointé of Lough Gur, and there are several persons still living around the Lough who positively assert that they have on various occasions distinctly heard the heart-rending, melancholy wail of the Lough Gur Banshee before the death of any member of those old families whose ancestors were unflinching adherents and clansmen of the great Earl of Desmond.

Tradition says the Banshee caoined a sad and lonely wail,
With a grief human bosoms never know,
As she paced those ramparts towering o'er the sunny vale,
When they laid him in silent Teampul Nuadh.

I remain, dear Mr. Editor, your faithfully,

OWEN BRESNAN.

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

By CHARLES SMITH, M.D.

Æquum est enim meminisse & me, qui discerem hominem esse et vos, qui Judicetis ut si probabilia dicentur nihil ultra requiratis. Cicero Univers

IN TWO VOLUMES.

VOL. I.

THE SECOND EDITION, WITH ADDITIONS.

CHAPTER III.—Continued.

About a quarter of a mile west of Bandon is Castle-Bernard, formerly Castle-Mahon, once the residence of O'Mahony. It is now a beautiful and pleasant seat of the Bernards, being rebuilt anno 1715 by Judge Bernard.

Kilbritton is now a distinct cantred, which anciently belonged to the barony of Courceys. The castle was formerly a seat of the Lords Courcey; and afterwards of Mac-Carty Reagh. The old Irish have a story that the Lord Courcey pawned this castle and lands to Mac-Carty, to secure the restitution of a white weasel he borrowed from him; and it unluckily happening that the weasel died, this accident gave title, or, which was equivalent in those days, a fair pretence to the more potent Mac-Carty to keep possession. When this castle was up it was a stately building, environed with a large bawn, fortified with six turrets on the walls. These buildings were taken down by the present proprietor, Jonas Stawell, Esq., who has erected a large modern house where the castle stood. It is pleasantly situated on a mount, between greater hills; the sea flows almost up to it, through the harbour of Court Mac-Sherry. To this castle belongs a privilege of fairs and markets, granted by several patents. Not far from it, on the sea coast, lies Coolmain, another castle of Mac-Carty Reagh; both these castles were taken by the Bandonians, in May, 1642, and kept in English hands ever since. The castle of Kilgobban, on the river Bandon, as also that of Cariganass, both belonged to Mac-Carty, as did that of Dundaniel, which being on his estate was reckoned a part of Carbery, though on the other side of the river. That part of Bandon, called Bridewell, belonged to this cantred, and another part of it, called Irishtown. The lands are well laid out in this neighbourhood, under pasture and tillage. The soil is mostly a light grey clay, with a slaty bottom.

Ibawne and Barryroe compose one barony: the first signifies the fair territory, as, indeed, it is in respect of the adjoining rough country of Carbery; the other has its name from the Barrys. In those two half baronies are many navigable creeks, with several sandy strands for manure, but especially that of Red Sand bay, which is mostly composed of broken cockle shells, and is accounted to bring several crops of wheat and barley more than any other sand, being carried on horses' backs 12 miles up the country.

The seigniory of this barony belongs mostly to the Earl of Barrymore. Places of most note in it are Timoleague, i.e., Tee mologa, the residence of the saint Molaga. This village is situate on an arm of the ocean which flows in between the hills, whose feet it washes. From Court Mac Sherry (the harbour's mouth) to Timoleague, it is two miles. This harbour was formerly navigable, but is now quite obstructed with sand; so that only small sloops and boats can come to Timoleague, and smaller sand vessels about a mile above it. A small river discharges itself here, called the Arigideen, i.e., the little silver stream; it runs at the foot of an hill, covered with an oak wood, for a mile before it reaches this town, in a serpentine form. At its entrance into the town, it washes the walls of an ancient castle (built by an Irish sept, called O'Shaghnassy) now belonging to the Earl of Barrymore, who is also proprietor of the whole town and parish, which consists of seven plow-lands. A few years ago, the castle was fitted up, and some looms erected in it, for linen weavers. This river, in its course, next washes the verge of the church-yard, which commands a prospect down to the harbour's mouth; and the other side is bounded by a circular meadow, reclaimed by Colonel Moore. It next glides by the walls of an ancient abbey of Franciscans, founded in the reign of King Edward II., in the beginning of the 14th century, by the Mac-Cartys. Some records mention a castle belonging to the Morils to have stood here, and that Mac-Carty Reagh took it from them and placed Franciscans in it. In this abbey, Edmund de Courcey (9), Bishop of Ross, was buried in March, 1518, he being a Franciscan. He new built the steeple, dormitory, infirmary, and library, and was otherways a great benefactor to it, both in his life-time and at his death, as the obitual book of this convent testifies (10). The building (though not roofed) is entire, consisting of a large choir, with an aisle formed by arcades on the south, which lead to a lateral wing. There is an handsome, square gothic tower, about 70 feet high, between the choir and the aisle; and one side of the same aisle is a square cloister arcaded, with a platform in the middle; this leads to several large rooms, one whereof is said to have been a chapel, another the chapter room, a third the refectory, besides a spacious apartment for the guardian of the house; there was also an hall, dormitory, kitchen, cellars, &c., altogether composing a large pile of building. Here are several tombs of the Irish families, viz., Mac-Carty Reagh's, in the midst of the choir; west of it is an old broken monument of the OCullanes; and on the right a ruined tomb of the Lords Courcey. The O'Donovans, O'Hea, &c., were also buried here. There were but 4½ acres of land found to belong to this house at the time of the dissolution, which was then possessed by the Lord Inchiquin, and now by the Lord Barrymore. A considerable part of the tithes were also granted to the college of Dublin. Timoleague was formerly a place of some note, being much resorted to by the Spaniards, who imported large quantities of wine here; and it is said there were formerly no less than 14 taverns that sold sack in the town. It is situated between the castle and the abbey, under an hill, which shelters it from west and northerly winds. Here is a regular street, one side of it being new built for the accommodation of linen weavers by the late Lord Barrymore, but the design, by the mismanagement of his Lordship's undertaker, failed. In it are some good slate-houses, a market-house, and bleach-yard; it has also four fairs in the year, but no regular market. Near it is a well dedicated to the Virgin Mary, much frequented on the 8th of September by numbers of the Irish. The festival day of St. Molaga (11), according to Colgan, is on the 20th of January, who was the ancient patron of this place.

To the S.W. of the town, on a rising ground, is Barry's-Hall, built by the Hon. Capt. Barry, on the estate of the late Lord Barrymore; it has a prospect of part of the arm of the sea, which comes up to the foot of the hill on which it stands, forming an handsome basin, interspersed with small islands. On the opposite side of the river is Maryborough, an handsome house, built by Captain Jervais, on a rising hill, commanding a view of the bay and river; beyond it, on the same side, is Burren, where Mac-Carty Reagh had formerly a castle, but it is now the estate of Mr. John Bowrn; on this side is the church of Rathclairn, and near it Mr. Scott has a good house. All this eastern side of Timoleague harbour lies in Carbery.

On the west side, as you go down the

(9) He had been a friar in this convent; was advanced to the See of Clogher by Pope Sixtus IV, June 18, 1484; and translated to Ross, the 26th of September, 1494, where he died in a very advanced age: He was brother to Nicholas de Courcey, baron of Kinsale, who died in Febrcary, 1474; he was assisted in new founding this abbey by his nephew James, Lord Kinsale, son to the said Nicholas. This Bishop was a great favourite of King Henry VII,, whose title and interest he constantly defended against the attempts of Lambert Simnel, and Perkin Warbeck. Upon Sir Richard Edgecomb's arrival at Dublin to take the oaths of the chief persons of Ireland, after the rebellion, he sent for him to advise him in his proceedings; and such an opinion was conceived of his loyalty that it was thought unnecessary to oblige him to take any oath. After the kingdom was settled, he assisted in July, 1489, at a provincial synod, convened by Octavian, Archbishop of Armagh, and was made an arbitrator between two contending Bishops of Kilmore. He was the first of English descent that ever sat in the See of Clogher.

(10) King's collect. in Marsh's library, p. 310.

(11) His life may be seen in the same author, taken from an ancient history: He was born in the territory of Fermoy, in this country, and was of the tribe of Dimma, which tribe, with those of the Deagadii and Luchtæ, possessed that part of the country, as the author of his life relates.

Colgan, Act. Sanct. p. 148.

bay of Court Mac-Sherry, is a good house, in a grove of trees, inhabited by Mr. Arundel; and about half way down, close to the shore, stands the ruins of Abbey-Mahon (12); it was founded by the Bernardine monks, at their own expense, who were a very rich order. The Lord Barry gave them 18 plow-lands, which constitute the parish of Abbey-Mahon; but this estate was only given them till the building was finished, which never happened; for soon after the dissolution of monasteries took place, and these lands were seized into the hands of the Crown. The walls of the church are standing, and an house is built on part of the ruins,, round which is a grove. In this parish is a good quantity of fine arable land. The next improvement on the river is the seat of Boyle Travers, Esq., encompassed with good plantations.

Close to the harbour's mouth is Court Mac-Sherry, built originally by Hodnet, an Englishman, who came from Shropshire; but the family degenerating into the Irish customs, assumed the name of Mac-Sherry.

The bay affords plenty of various kinds of sea fish; formerly pilchards were taken in it; and on the shore are several buildings, called in this country fish palaces, for curing that fish. Plaice are so good here that, when in season, many prefer them to turbot, and some are near as large. Considerable draughts of salmon have also been taken in this bay. On both sides are prodigious high cliffs towards the entrance of this bay, where eagles, hawks, and herons build their nests. The old head of Kinsale forms the east side; those on the west, in the parish of Lislee, are called Coolum, being of a vast height; these are on the lands of the present Bishop of Elphin. In order to take hawks, they let down a man from a shelving precipice, where the persons who hold him have scarce footing; the hawks having built under a hanging rock, the man, by the assistance of an hook fixed to a pole, which he carries for the purpose, lays hold of the cliff, and draws himself in; having pillaged the ayry, he quits the concave of the rock, swings off, and is pulled up by his companions.

Lord Barrymore is proprietor of the geratest part of the parish of Lislee, and claims the royalties from Court Mac-Sherry bay to Glandore harbour; those more westerly are Sir John Freke's, in virtue of a patent granted to the Coppingers by King James I.

This country abounds with potatoes; the inhabitants prepare their lay ground by grassing and burning—a vile practice where manure is so plenty. Some lay on sea-wreck (13) which they say makes potatoes wet if laid out too late in the year, and this afterwards produces a good crop of barley. In this parish is a peninsula of about five acres, to which is a very narrow passage; and on this peninsula are the ruins of an old castle, defended by square bastions, to prevent people from landing. The island is a rock, thinly covered with earth; but is constantly mowed every year, though never known to be manured. This was a place where the Irish formerly secured their cattle by night; there are many such on the coast, particularly one to the west, defended by a wall, a castle, and two turrets; under the castle are several subterraneous caves, running into the middle of the island, the ground of which is very fertile. Near Dunworly strand is a spring, called St. Anne's Well. To the west the coast is all a bold, high shore, abounding with stupendous cliffs, which astonish while they please us. The vast expanse of the ocean adds to the grandeur of the scene: there is no object affects the mind so much; for one cannot see the heavings of it, even in a calm, without a pleasing astonishment; but when it is worked up by a tempest, so that the horizon seems to be nothing but foaming billows and floating mountains, it is impossible to describe the agreeable horror that arises on such a prospect.

On most of this coast are great variety of caves, worked by the sea; these caves are generally the habitation of wild pigeons, gulls, and other sea-fowls, who live in the upper crevices; while porpoises, seals, and other monsters of the deep have their abode below. In the bay of Cloghnakilty, which divides Ibawne from Barryroe, is the pleasant island of Inchydony. This island, by an inquisition held at Cork, Nov. 4, 1584, was found to be escheated for want of heirs to Queen Elizabeth; and that the Bishop of Ross had but seven marks, half faced money, out of the same. In it is a pleasant seat of Mr. Hungerford. Not far from Cloghnakilty is Dunamore, belonging to Sir Charles Moore, Bart.

Rathbarry, an ancient castle of the Barrys, now called Castle-Freke, in the west of this barony, near Ross-Carbery, is a pleasant seat of Sir John Freke, Bart: it commands an extensive view of the ocean and coast to the west. Adjacent to it is a large park, and also a fine fresh water lake, stored with pike, over which is an agreeable terrace. To the east of it is Kilkerin, the house of Mr. O'Hea, where is also another fresh water lake, of 52 acres, stored with fish. Almost on every headland of this barony were castles erected by the Irish, seven of which belonged to the sept of O'Cowig, as Dun-deedy, Dun-owen, Dun-ore, Duneene, Dun-o-cowig, Dun-worley, and Dun-gorley. Dun-deedy now belongs to the Right Hon. the Earl of Egmont; it is a castle on a very small island, to which there is a narrow passage from the main, being equally the work of nature and art. It belongs to the manor of Liscarrol, in Orrery. It is commonly, by seamen, called the Galley-head, and is sometimes fatally mistaken by them for the Old head of Kinsale, when the light of the latter is not seen. This promontory, like that of Kinsale, stretches itself a good way into the ocean, and is also a considerable height; there are several caverns formed at its base, by the working of the waves.

About a mile south-west of Cloghnakilty is the ruined castle of Ahimilla, built by O'Hea.

(To be Continued.)

(12) This house has been mistaken for the celebrated abbey, called Sancto Mauro, alias De Fonte Vivo, which stood in the parish of Miros, in W. Carbery.

(13) Sir George Mac-Kenzy says, nothing makes their lands so fertile in Scotland, or gives a better increase to barley, than sea-wreck; but lands often used to this manure, yield but bad oats, and in small quantity; and the husks, both of barley and oats, that grow on such lands, are thicker than those which grow on other lands, and have also a greater mixture of darnel. Phil. Transact. n. 117. p. 390.

GLASHEN-GLORA.*

'Tis sweet in midnight solitude,
When the voice of man lies hush'd, subdued,
To hear thy mountain voice so rude,
Break silence, Glashen-glora!

I love to see thy foaming stream
Dash'd sparkling in the bright moonbeam;
For then of happier days I dream,
Spent near thee—Glashen-glora!

I see the holly and the yew
Still shading thee, as then they grew;
But there's a form that meets not my view,
As once, near Glashen-glora!

Thou gaily, brightly, sparklest on,
Wreathing thy dimples round each stone;
But the bright eye that on thee shone
Lies quench'd, wild Glashen-glora!

Still rush thee on, thou brawling brook;
Though on broad rivers I may look
In other lands, thy lonesome nook—
I'll think on Glashen glora!

When I am low, laid in the grave,
Thou still wilt sparkle, dash and rave
Seaward, till thou becom'st a wave
Of ocean, Glashen-glora!

Thy course and mine alike have been
Both restless, rocky, seldom green—
There rolls for me, beyond this scene,
An ocean, Glashen-glora! !

And when my span of life's gone by,
Oh! if past spirits back can fly,
I'll often ride the night-winds sigh,
That's breathed o'er Glashen-glora!

* A mountain-torrent, which finds its way into the Atlantic ocean through Glengariff, in the west of the County Cork. The name, literally translated, signifies "the noisy green water."

BRAIN WORK.

ITS EFFECT UPON THE BODY AND THE KIND OF FOOD IT DEMANDS.

The changes of tissue in the brain that take place during study and thought are very important and very rapid. It has been estimated that three hours of brain work cause as great an exhaustion of the forces of the body as an entire day of manual labour.

This waste must be replaced by abundant food, but its selection requires careful consideration and often self denial, for many things which the physical worker can eat with perfect impunity are slow poison to the brain worker, who exercises the brain at the expense of the body and rarely gives the latter sufficient exercise to counteract the mental strain and keep it in condition to resist disease. Bear in mind that, while the waste of the body is much more rapid, the deprivation of physical exercise encourages torpidity of the voluntary functions and renders them sluggish in eliminating those wastes; therefore it is of the utmost importance that the tasks imposed upon them should be light.

Brain workers require the most concentrated and easily digested foods. They should eat fresh beef and mutton, fish, eggs—cooked in many forms, but never hard boiled or fried—oysters and crisp salads, lettuce, chicory, tomatoes, watercresses, etc., with mayonnaise or French dressing. They should begin the day with fruit and make it form the principal part of the luncheon and be very sparing in their use of cereals eschewing entirely white bread and oatmeal. Their ideal luncheon, which must be light if they continue to work in the afternoon, is a glass of milk or cup of hot chocolate or, better still, a glass of fresh buttermilk, with two or three graham wafers or a bit of toast and some fruit, an apple, figs, or an orange.

Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

DUNGANNON, a borough, market and post-town, in the parish of Drumglass, barony of Dungannon, county of Tyrone, and province of Ulster, 10 miles (N. by W.) from Armagh, and 76 (N.N.W.) from Dublin, on the road from Armagh to Coleraine; containing 3,515 inhabitants. This place appears to have been the chief seat of the O'Nials from the earliest period of Irish history; but the first direct notice of it under its present name is in a spirited letter addressed in 1329 to Pope John from Dungannon, by Donald O'Nial, in which he styles himself "King of Ulster and true heir of the whole dominion of Ireland." He declares that, previously to the coming of St. Patrick, 130 of his royal ancestors had been kings of Ireland; and that from that period till the landing of Hen. II., in 1172, "sixty monarchs of the same princely family had swayed the Hibernian sceptre." In 1364, O'Nial, in his letters to Edw. III., styles himself "Prince of the Irishry of Ulster," and dated from this place, whence, in 1394, he went to make his submission to Rich. II. at Drogheda. Henry O'Nial gave a splendid entertainment here to the Primate Bole, and assigned to the church of Armagh all his lands in Moydoyn; and in 1489 Con O'Nial founded a Franciscan monastery, which he amply endowed. This establishment continued to flourish till the Reformation, when it was granted by Queen Elizabeth to the Earl of Westmeath, and it was subsequently assigned to Sir Arthur Chichester in the reign of Jas. I. In 1492, Con O'Nial, the founder, being murdered by his brother Henry, was buried in this monastery with great pomp; and Neal M'Art O'Nial, rising in arms to avenge his death, the Earl of Kildare marched into Ulster to oppose him, took the fortress of Dungannon by storm,, and soon reduced O'Nial to obedience. In 1501 the Albanian Scots attacked the fortress on St. Patrick's day, but were driven back with great slaughter by O'Nial, who then held it for the English Government. In 1517, O'Nial was found again in rebellion against the English, but the Earl of Kildare having reduced Dundrum and taken Maginnis prisoner, marched against Dungannon, stormed the fort and burnt the town, both of which were restored by O'Nial after his submission. Con O'Nial, in 1538, took up arms against Henry VIII., in favour of the see of Rome, marched from this place with a powerful army into the English pale, and laid waste the country as far as Meath, where he was met by the Lord-Deputy Grey, who defeated him at Bellahoe, and compelled him again to retreat to his stronghold of Dungannon; he soon after submitted to the English authority, and in 1542 took the oaths of allegiance. After this battle Henry assumed the title of King, instead of Lord of Ireland; and O'Nial covenanted to renounce the name of O'Nial, to adopt the English habit and language, and to build houses and farm the lands after the English mode. For this submission he was created Earl of Tyrone, and his illegitimate son Matthew was made Baron of Dungannon, and received the state of the O'Nials by patent. In 1552, Shane O'Nial, son of the Earl of Tyrone, appeared in arms against his father, and destroyed the fortress of Dungannon, and committed other depredations; but in 1556, Fitzwalter, then Lord-Deputy, marched against him, expelled him from the territory, and replaced the Earl in his possessions. Shane again revolted in 1559, and in the following year burst into the English pale, but was reduced to submission by the Lord-Deputy Sussex. From Dungannon he proceeded to England, accompanied by his body-guard, consisting of 600 soldiers, who marched through the streets of London, armed with their battle-axes and dressed in the costume of their country. He was graciously received by Elizabeth, pardoned, and loaded with favours; but shortly after his return to Dungannon, he again appeared in arms, destroyed the city of Armagh with its venerable cathedral and monasteries, and left only a few mud cabins remaining; he also destroyed the city of Derry and laid waste the whole county; but in 1567 he was treacherously murdered in the Scottish camp. Hugh O'Nial, who by the favour of Elizabeth had been raised to the Earldom of Tyrone, commenced building a magnificent castle at Dungannon, and imported large quantities of lead for its roof; in 1587 he obtained from Elizabeth the grant of a weekly market and fairs, and in 1591 the lordship of Tyrone was formed into a county, subdivided into eight baronies, and this place made the county town and a gaol built in it accordingly. In 1595, the Earl of Tyrone rebelled against the English Government, and, placing himself at the head of 14,000 men, took and destroyed several forts, burnt Portmore bridge, laid siege to Monaghan, and having melted into bullets the lead which he had imported under pretence of roofing his castle, ultimately made himself master of the whole of that county. Having defeated the English in many engagements, particularly at Benburb, he was universally hailed as the champion of Ireland, and received in his fortress here the envoy of the Pope, who brought him valuable presents. The Lord-Deputy Mountjoy marched against this powerful chieftain and defeated him in several battles; and in June, 1602, having secured Armagh and Charlemont, advanced towards Dungannon. Tyrone, aware of his approach, set fire to the place and retreated northward; but being thus driven from the venerable seat of his ancestors, he never regained his lost power. In the following year he made his submission at Mellifont, and was pardoned; he was restored to his Earldom, and obtained a grant of his lands by letters patent; but meditating new designs against the State, he was discovered, and dreading the power of Jas. I., fled to the Continent in 1607, leaving the whole of his extensive possessions to the King, who, in 1610, granted the castle and manor of Dungannon, with all their dependencies, to Sir Arthur Chichester. In 1612, Sir Arthur obtained from the King a charter of incorporation for the town which he was about to build, a grant of 1,140 acres of land, and 500 acres more for the site of the intended town; upon teh former he built a bawn of limestone, 120 feet square, with bulwarks and a deep fosse; and upon the latter, previously to 1619, six large stone houses, six strong houses of frame-work timber, and a spacious church, which, with the exception of the roof, was completed at that time, whence may be dated the origin of the present town. On the breaking out of the war in 1641, Sir Phelim O'Nial, having taken the fort of Charlemont by stratagem, and made the governor prisoner, seized the castle, town, and fort of Dungannon on the same night; and having put many of the inhabitants to death, kept possession of it till after the battle of Benburb, in 1646, after which the town and church were burnt, and soon after the castle was dismantled by order of Parliament. The castle was rebuilt soon after the Restoration, and in 1688 the Rev. George Walker, rector of Donaghmore, raised a regiment in his parish and marched with it to Dungannon, to secure the garrison for the Protestants; it was entrusted to the care of Col. Lundy, who deserted his post on the 13th March, and the inhabitants fled to Strabane. It was garrisoned in 1689 by the troops of Jas. II., who, on the 13th of April in that year, visited this town and inspected the garrison, whence he marched to Omagh and Strabane; but his forces occupied the town and neighbourhood during the whole of that important struggle. From this period the only event of historical importance connected with the place is the meeting of delegates from 269 corps of Ulster volunteers, who in 1782 assembled at Dungannon and passed 20 resolutions, declaratory of the independence of the Parliament of Ireland.

The town, situated about three miles from the shore of Lough Neagh, is spacious, handsome, and well built. The surrounding country is richly diversified, and the situation of the town on a lofty hill of limestone, commanding interesting and extensive prospects on every side, renders it both a healthy and a pleasant place of residence. It is second only to Omagh in extent, and is rapidly increasing in opulence and importance. The inhabitants, under the title of the "Provost, Free Burgesses, and Commons of the Borough of Dungannon," received a charter of incorporation from Jas. I., in 1612, by which the site of the town, with three parcels of land called Crosse, Brough, and Fernes-keile (with the exception of the castle and a space of 500 feet around it in every direction from its walls), was created a free borough. The charter also conferred the right of returning two members to the Irish Parliament, which was exercised till the Union.

Of the castle and fortress of the Earl of Tyrone, not a vestige is remaining; nor are there any traces of the castle and bawn erected by Sir Arthur Chichester.

The monastery, founded by Con O'Nial, was situated near the site of the present distillery; some fragments were remaining a few years since, but every vestige has now disappeared. Dungannon gives the title of Viscount to the family of Trevor, of Brynkinalt, near Chirk, in the county of Denbigh.

AWFUL DEVASTATION BY FOREST FIRES.

The enormous loss of life and property every year by forest fires, as shown by a recent bulletin of the Bureau of Forestry of the United States, is astonishing. Investigation has shown that in an average year sixty human lives are lost in these conflagrations, twenty-five million dollars' of property is destroyed, more than ten million acres of timber land are burned over, and young forest growth worth, at the lowest estimate, seventy-five million dollars is killed. The figures are mere estimates, and fall far short in showing the full damage done.

"No account at all is taken of the loss to the country due to the impoverishment of the soil by fire," continues the bulletin, "to the ruin of water-courses, and the drying up of springs. Even the amount of timber burned is very imperfectly calculated, and the actual quantity destroyed is far in excess of that accounted for. Forest fires in this country have grown so common that only those are reported that are of such magnitude as to threaten large communities. The lumbering industry in remote sections of the country may be ruined and people forced to flee for their lives without a mention of the disaster beyond the place near where it occurred.

"The fires that burnt this year in Washington and Oregon were uncommon only in the number of lives lost. The burning of logging and mining camps and farm buildings, the loss to the country in the destruction of timber and young tree-growth, are of yearly occurrence. Every fall, not only in Washington, Oregon, Colorado, and Wyoming, but up and down the Pacific coast and all over the Rocky Mountain country, fires burn great holes in the forests and destroy the national wealth. The air of the mountains over hundreds of miles is pungent with the smoke of conflagration, and navigation on Puget Sound has often been impeded by smoke. The following comment by Dr. Henry Gannett, of the United States Geological Survey, should convey a fair idea of the damage done in the State of Washington: 'In less than a generation two-fifths of the standing timber has been destroyed in one of the richest timber regions on the Continent, and of the destruction more than half has been caused by fire. Assuming that the timber would, if standing, have the value of seventy-five cents. per thousand cubic feet, not less than 30,000,000 dollars worth has gone up in smoke, a dead loss to the people of the State.'"

A few of the States have adopted laws designed to suppress forest fires, and the Bureau of Forestry is making a special effort to secure similar legislation in other States, and to create what will be even more effective, a public sentiment against this ruthless waste of one of the country's greatest natural resources. In many localities there is on the part of most people an amazing indifference to the destruction of woods by fire so long as their own property is not endangered.

ROYAL SOCIETY OF ANTIQUARIES OF IRELAND.

ANNUAL GENERAL MEETING.

The annual general meeting of the Royal Society of Antiquaries of Ireland was held on 28th ult. at the rooms of the Society, 6 Stephen's green. The proceedings were private. Mr. J. Ribton Garstin, F.S.A., D.L., was appointed President for the next three years, and the following were also elected:—As Fellow—P. L. Connellan, 6 Via Augusto Valenziani, Porta Salaria, Rome. As Members—Mrs. Mary Allen, Ailsa Lodge, Kilrane, Co. Wexford; Dr. James Barkley, Maghera, Co. Derry; Rev. T. R. Brunskill, B.A., The Rectory, Killencoole, Castlebellingham, Co. Louth; Miss Carolin Colville, Ph. —., Orono, Maine, U.S.A.; Robert Coulter, Merchant, Thomas street, Sligo; Rev. Canon M. A. Fricker, P.P., the Presbytery, 25 Rathmines road, Dublin; Rev. Robert F. Hanna, B.A., the Manse, White Abbey; Mrs. Learmont-Anderson, Ressnashane, Ballymoney, Co. Antrim; Count Arthur Moore, D.L., Aherlow Castle, Co. Tipperary: Mrs. Marion Mulhall, 35 Via Venti Settembre, Rome; Mrs. O'Neill, Jocelyn street, Dundalk; C. A. Pim, Monarna, Whit Abbey, Co. Antrim; Jonathan Pim, Barrister-at-Law, 10 Herbert street, Dublin; The London Library, St. James's square, London, S.W., per Charles Hagbert Wright, LL.D., Librarian; Hector Wallis, J.P., Balheary House, Swords, Co. Dublin; Rev. Thos. F. Watters, B.A., St. John's, Blackrock, Co. Dublin; T. W. Wilson, 10 Selborne road, Handsworth, Birmingham.

The report dealing with ancient structures said that an important advance in connection with the preservation of our national monuments was made in the introduction of Sec. 19 of the Local Government (Ireland) Act, 1898, which enabled any County Council to take charge of any monument in the county not already vested. The report contained the following reference to the Hill of Tara:—

The County Council of Galway is entitled to the honour of being the first to make the section operative, and under its provisions the High Cross of Tuam, and the ruined Church Temple Jarlath in the same town have been judiciously repaired.

HILL OF TARA, COUNTY MEATH.

The irreparable injury done by the partial destruction of the "Rath of the Synods," continued during a portion of the present year, has occupied the serious attention of the council, and everything that was considered practicable was done to stop the work of destruction.

The alleged object in digging up this mound is stated to be in search for "The Ark of the Covenant," which the instigator of the search has stated he believes to have been deposited in this particular rath.

The search, as prosecuted by him, involved the digging up and consequent destruction of the contour of the portion of the mound examined, and it is to the credit of Irish archæologists that they have not allowed themselves to be identified with this act of vandalism.

The search having proved fruitless, and a strong feeling of indignation being gradually aroused in the locality and elsewhere against the continuance of the work, and for other reasons, it was abandoned during the week ending 28th June last. On the 18th of that month, the Navan Rural District Council, in whose district the monument is situate, adopted a strongly-worded resolution against the action of the parties now engaged in obliterating the ancient and historic land-marks of the far-famed Hill of Tara in the idiotic search for the mythical Ark of the Covenant."

The report stated that three years having elapsed since the election of Professor E. P. Wright as President, Mr. John Ribton Garston, M. A., F.S.A., D.L., had been nominated the President for the three years next ensuing. He had been long and intimately connected with the work of the Society.

The report was adopted.

Mr Garston was elected President, and the honorary officers were re-elected.

EVENING MEETING.

At the evening meeting Mr. John Ribton Garstin, President, occupied the chair, and there was an extremely large attendance.

The President delivered his inaugural address to the members of the Society. He said the Society having been originated in Kilkenny, it was fitting that they should select their president from the provinces. He (Mr. Garstin) had come into office after one whose presidency had been a period of remarkable prosperity. Dr. Wright had brought exceptional experience, knowledge, and zeal to bear upon the presidency of the Society. The President referred to the advent of the new Sovereign to the Throne as affecting them in relation to the coinage. Although they had many notable numismatists, such as Lindsay, Simon, Aquila, Smith, and Dr. Fraser, this important branch of research seemed to have been greatly restricted. The study of postage stamps and book plates had monopolised most of their attention, being a more fashionable, if less instructive, branch of research. Antiquarian journals used to make countless references to the ancient coinage, but now there was scarcely a contribution on the subject to be met with. Volumes might be written on the subject of the Lial Fail—Stone of Destiny—which since its removal from Scotland had been used at every Coronation at Westminster Abbey. There were controversies about its supposed connection with Tara and the early monarchs of Ireland; about the connection of the stone with Egypt and Spain, and with the Milesian incursion into Ireland. It was alleged to have been the stone on which Jacob had rested his head at Bethel. What, asked the President, did they know of the Irish regalia in the past? He recommended it to the members as a fitting subject for further investigation. Dealing with the question of coinage, the President pointed out how completely Ireland had vanished from the coinage. No coin with the image or inscription of any of the early monarchs of Ireland was known, nor did the letters commonly called Irish appear on any coin now extant, the inscriptions from the earliest times being in Latin. From the time of Charles II. to the present no silver money was coined in, or exclusively for, Ireland, except Bank tokens. No money of any kind was struck for Ireland in the reign of Queen Anne. The Irish series, exclusively copper, survived the Union, but came to an end with the issue of pennies and half-pennies coined in Birmingham in 1822. Since then they had no coins but those common to the United Kingdom. The President traced in interesting fashion the changes in design and formulæ in the coinage, pointing out how all reference to Ireland had disappeared in it. Was it, he asked, too much to hope that the arms of the United Kingdom might reappear on the gold coinage—that the Shamrock, Rose, and Thistle might be less sparingly used. Referring to the dispute over the ancient Irish gold ornaments discovered in 1896, and now in the custody of the British Museum, he said the Council had not touched upon it in their report, and he proposed to follow their example. As the case was sub judice it would be improper to discuss its merits. The Society of Antiquaries of London should have abstained from interfering with the Government on behalf of the British Museum, especially as the Museum official who bought the ornaments was Secretary of the Society, and its President was one of the Trustees of the Museum. They seemed to suggest a desire that outside of London no Society of Antiquaries, no National Museum, and no gold ornaments should be tolerated (laughter).

The Most Rev. Dr. Donnelly, Bishop of Canea, proposed a vote of thanks to Mr. Garstin for his address. He said the address covered a wide field and had left nothing to be added. It showed an amount of patient research, erudition, and eloquence which was seldom to be found in addresses of the kind (applause).

Dr. Perceval Wright, the outgoing president, seconded the vote of thanks, which was passed unanimously.

Dr. Ffrench read an interesting paper by Miss J. Clarke on "Kilree, with some mention of Kells in Ossory." The paper, which was illustrated by a series of excellent lantern slide views, was referred to the Council for publication. The reading of the other papers on the agenda was postponed to the next meeting.

LITERARY NOTES.

Mr. H. W. Massingham will in future contribute a weekly causerie on "Politics and Persons" to the "Speaker." Lord Rosebery's attacks on the Government he wittingly describes this week as "about as serious as a charge of Amazons at an Empire ballet."

✧ ✧ ✧

Mr. Stead, in the "Review of Reviews," starts the "romance that is never to end" that in ages far earlier than arose the rites Hall, the seat of Lord Gordon, on the confines of Windsor Forest." We hear that the Australian "Review of Reviews" has scored heavily by announcing the immediate publication of a "romance that is never to begin."

✧ ✧ ✧

Mr. Maeterlinck contributes to the February number of the "Pall Mall Magazine" a picturesque article on the "Battle of the Spurs." There is also a "Real Conversation" by Mr. Archer with "Lucas Malet." Lord Wolseley continues his study of "The Young Napoleon." Sir F. C .Burnand gossips delightfully about "Punch's" unscrupulous competitors; while Mr. Mallock serves up new rashers of Bacon.

✧ ✧ ✧

Messrs. Heinemann's new publication, 'The Masters 'Masterpieces," is an attempt to choose from the work of each of the 60 greatest masters in painting one representative work, so as to afford a bird's-eye view of the realm of art. Nearly every picture has been reproduced from negatives newly and specially taken for this collection, and only in a few instances have existing photographs been employed.

✧ ✧ ✧

The monument to R. L. S., which it was hoped would be ready by midsummer of last year, is not yet complete. M. Saint Gaudens, who was chosen to execute the work, has been suffering from ill-health; but he has now remodelled the bas-relief which forms the body of the Memorial, and it is being cast in Paris. It is expected that the monument will be ready for erection in Saint Giles' High Kirk, Edinburgh, in five or six months.

✧ ✧ ✧

I notice (says a literary critic) that Mr. Alfred Nutt has taken the trouble to correct a "Saturday Reviewer" for saying that Lady Gregory in her "Cuchulain of Muirthemne" has done for Irish legend very much what Lady Charlotte Guest did for Welsh. Perhaps the reviewer only meant what Mr. Yeats means when he says in his introduction that Lady Gregory has given modern Ireland its Mabinogion—namely, that she has made the old legends practically available for modern readers. It is true, of course, as Lady Gregory states herself, that her book is a compilation and rearrangement of previous versions, not, as Lady Charlotte Guest's was, a literal and original translation. Probably Mr. Nutt feels that in the warm welcome given to Lady Gregory's book, the services of earlier translators are being unduly ignored, and particularly the especial service of Miss Eleanor Hull in her "Cuchullin Saga," published four or five years ago in his "Grimm Library."

✧ ✧ ✧

Mr. Gosse has given this week in the "Daily Chronicle" an interesting account of the emergence of the Goncourt Academy from its long litigation and of its present constitution. When the first meeting came to be held only seven of the Academicians originally designated by Goncourt himself survived. These were: MM. Gustave Geffroy, Leon Hennique, J. K. Huysmans, Paul Marguerite, Octave Mirbeau, and the two brothers Boex, known to the literary world as "J. H. Rosny." They completed their number by the election of MM. Elemir Bourges, Lucien Descaves, and Leon Daudet, the last-named taking the place of his father, Alphonse Daudet, whom Goncourt nominated. Goncourt would not have either poets or critics in his Academy; and Mr. Goss tries to enable the public in these countries to realise what kind of a body it was that Goncourt had in mind by drawing up a fancy list of the writers of whom a similarly constituted academy might perhaps consist in England. He suggests the names of Mr. Conrad, Mr. George Gissing, Mr. Robert Hichens, Mr. George Moore, "Mark Rutherford," Mr. Zangwill, with Mr. Wells for president, who might proceed to elect Mr. Bernard Capes, Mr. Arthur Morrison, and Mr. Benjamin Swift.

✧ ✧ ✧

Herr Ebertein, the sculptor of the Goethe monument presented by the German Emperor to the city of Rome, has followed a custom which has lately come into fashion with such memorials. The poet is represented as he was in the bloom of early manhood, exhibiting the youthful strength and masculine beauty which distinguished him on his first visit to Rome. He stands amidst a heap of ancient fragments of Roman art, as a type of the influence of classic antiquity upon his life and work. Three subordinate groups are placed at the base of the monument—Iphigenia and Orestes, Mignon and the Harper, and Faust and Mephistopheles; these figures personifying respectively the drama, the lyric poetry, and the philosophy of Goethe.

✧ ✧ ✧

There is a very interesting paper by Mr. George Iles in the February number of the "World's Work" on Mr. Herbert Spencer at work and at play. When Mr. Spencer began his composition of "First Principles" in 1860 he adopted the practice of dictating to an amanuensis:—

He was spending the summer by the shore of a Scottish loch. His habit was to dictate for a quarter of an hour, then row for an equal period, with the object of so stimulating the circulation of the blood as to carry him through another fifteen minutes' dictation, and so on through the forenoon. Neither then nor afterwards has he worked in the afternoon. Ten years later, at times when his health fell to a low ebb, he would go to a racket-court in the North of London, play with the man in charge, and dictate in the intervals of the game.

One of the most abtruse portions of the "Principles of Psychology" was composed under these unpromising circumstances.

✧ ✧ ✧

Particulars are given of how Mr. Spencer wrote the volumes of the "Synthetic Philosophy." He used to leave his house soon after nine in the morning and go to Kensington Gardens. There he walked for an hour:—

Regularly at ten o'clock he appeared in his work-room in Leinster place, a retreat known to hardly anyone, and sacred against intrusion. He first dictated his correspondence, often rebelling at its onerous demands. Then he turned to his systematic work, soon rising to the full tide of dictation; usually he went on without breakfast till close on one o'clock, when he hurried away to luncheon. If his health was out of order he would stop abruptly at any moment and leave the house, saying that his head felt queer. When fairly well he would smoke half a cigar.

The dictation, it seems, was continuous; there were no interruptions, and only brief pauses. In resuming his task he seldom needed to be reminded of the last word spoken.

✧ ✧ ✧

Mr. Spencer, we are told, has never been much of a reader; "he was wont to say that if he were to read as much as other people he would know as little as they":—

He has never bought many books. . . He used to read but little in the forenoon, he dared not read at all in the evening, through dread of insomnia; but for all that he seemed to miss nothing that bore on his work. Almost all his reading must have taken place at odd moments just before breakfast, after luncheon, and in the afternoons passed at the Athenaeum Club.

He is familiar with Shakespeare and Scott. He has a hearty admiration of "Tristram Shandy"; he regards "The Autocrat of the Breakfast Table" as a gem.

✧ ✧ ✧

There reaches us (the "Academy and Literature" remarks) from New York a beautifully printed thin volume which bears upon its title page: "Some letters, by Robert Louis Stevenson, with a autroduction by Horace Townsend." Mr. Townsend tells us that these letters were addressed to Mr. Trevor Haddon, at that time (twenty-three years ago) an unknown but aspiring art student. Mr. Haddon wrote to Stevenson as an admirer, and from that introduction followed the letters here first printed. They are delightful and characteristic letters, hardly touching Stevenson's highest in the way of correspondence, perhaps, but full of wisdom, kindliness, and good counsel. We extract the following from a letter dated from Hyeres, where Stevenson, it will be remembered, was so happy and contented:—

In your own art, bow your head over technique. Think of technique when you rise and when you go to bed. Forget purposes in the meanwhile; get to love technical processes, to glory in technical successes; get to see the world entirely through technical spectacles, to see it entirely in terms of what you can do. Then when you have anything to say, the language will be apt and copious.

And again:—

Cling to your youth. It is an artistic stock-in-trade. Don't give in that you are aging, and you won't age. I have exactly the same faults and qualities still; only a little duller, greedier, and better tempered; a little less tolerant of pain and more tolerant of tedium. The last is a great thing for life but—query?—a bad endowment for art?

✧ ✧ ✧

The last letter was written in 1884. Stevenson had been seriously ill, and had "fallen into a kind of blindness." This more inclines me," he says, "for something to do, to answer your letter before I have read it, a safe plan familiar to diplomatists." Then he falls into his old habit of sermonising, but how excellent and strong it all is:—

You seem to me to be a pretty lucky young man; keep your eyes open to your mercies. That part of piety is eternal; and the man who forgets to be grateful has fallen asleep in life. Please to recognise that you are unworthy of all that befalls you; . . . but, indeed, we are not worthy of our futures; love takes us in a counterfeit, success comes to us at play, health stays with us while we abuse her; and even when we gird at our fellow man, we should remember that it is of their good will alone that we still live and still have claims to honour . . . I have been getting some of the buffets of late; but I have amply earned them—you need not pity me. Pity sick children and the individual poor man; not the mass. Don't pity anybody else, and never pity fools. The optomistic Stevenson; but there is a sense in these wanderings.

All this is real Stevenson.

✧ ✧ ✧

The "Young Man" prints this month the opinions of various writers concerning the decay of the novel. The opinions, naturally, differ, and none are particularly illuminating. We like best what Mr. Jerome and Mr. E. F. Benson have to say. Says Mr. Jerome:—

The form of the novel will change with the changing ages. But delight in the pictured story—in the imagined life—will remain wth us till man has ceased to dream.

And Mr. Benson writes:—

Personally, I don't believe novels are any worse now—i.e., the best of them—than they ever have been. Because an enormous number of indifferent novels are written, it does not follow that the art of novel-writing is perishing, but only that an increased number of folk are attempting to practise it. If I go on, I shall express an opinion, so I will stop.

If other opinions had been expressed with equal simplicity we should have thought them better. worth reading. When Miss Barlow says "there are at present no great novelists" we begin to doubt her critical faculty.

SCIENTIFIC TOPICS.

George Craig, an aged inventor, of Lyons, Mich., has invented a scheme by which he says that watchmen in banks and other similar institutions will be entirely dispensed with. His invention consists of a secret chemical compound stored in the door of the vault, which being feloniously opened allows an overpowering stench to fill the room, overcomes the intruder and renders him unconscious, in which condition he remains until he is discovered.

✧ ✧ ✧

A collapsible lifeboat invented by Valdemar Engelhardt was recently tested by order of the American Navy, War, and Treasury Departments. The boat is 20 feet long and 6 feet wide. It has collapsible gunwales 2½ feet high. It is claimed for it that it can be easily handled and stowed away. The sides are composed of canvas braced by stanchions. Around the gunwales is woven a fabric of waterproof material lighter than cork. The inventor claims that his boat is unsinkable.

✧ ✧ ✧

An electric dynamo which had been installed in the Yale and Towne Works at Stamford, Conn., burst on January 3, while it was being tested. At the time of the accident the machine was making 3,600 revolutions per minute and had been running at top speed for ten minutes. Although there were six or eight men in the dynamo room at the time, and huge fragments weighing from 200 to 300 pounds were scattered about, no one was injured. The windows and woodwork, however, were badly damaged.

✧ ✧ ✧

The largest pair of animal tusks ever found in the frozen North have arrived in Seattle from Keenwalik, a mining camp 300 miles north-west of Nome, well within the Arctic circle. The remains of the animal were found by M. F. Moran, the postmaster of Keenwalik, and will be forwarded to the Smithsonian Institution. The tusks are twelve feet from end to end. One weighs 168 and the other 172 pounds. Both are in an excellent state of preservation, the ivory being perfectly sound and of fine quality.

✧ ✧ ✧

During the recent shortage of coal in the United States the Standard Oil Company decided to make some experiments with the use of oil as fuel. The tests were made at the works at Greenpoint and Hunter's Point, near New York, and the result was so satisfactory that it is extremely probable that the oil burners will be adopted permanently and extended to the company's other works. The device used was the invention of Henry M. Pratt, one of the millionaire directors of the company, who has worked in every capacity in many of the different yards of the company, in order to familiarise himself with the details of the work done at the different plants.

✧ ✧ ✧

On January 5 the huge Pennsylvania Railway bridge crossing the Pacific River at Newark was raised. The steel structure was divided into three parts, two of which were first lifted 13 feet above their former level, whereupon the raising of the third part began. The work was accomplished by nightfall of the same day. The reason for the lifting of the bridge is to be found in the fact that the tracks through Newark are elevated. A second bridge crossing the Passaic, and used by local and freight trains ordinarily, is now in use for all traffic until the main bridge is raised to the height of the track elevation and is made safe for travel.

✧ ✧ ✧

An automobile in which there is a total absence of belts, chains, or gearings has been designed by two New Yorkers, C. J. Dorticus and E. W. Schneider. The only noticeable feature of the vehicle is the construction of the wheels, each one of which contains an electric motor in the hub. The current is the carriage and driven by an oil engine. One of the advantages of this system is said to be that there is almost no occasion for a vehicle becoming stranded on the road. Even if three of the motors should become disabled, which is almost out of the question, except in case of a smash-up, the one remaining motor is sufficient to bring the carriage home. The vehicle is steered by shutting off the current to the wheels on one side while it is applied to those of the other.

✧ ✧ ✧

Among the recent pamphlets issued from the American Census Office is one entitled "Patent Growth of the Inventive Arts, 1870-esting information about the patent system of this country. It states that the Bell telephone patent was the one which made the greatest amount of money, and the next best record was that of the four-motion feed for sewing machines. The latter is said to have netted its owners 32,000,000 dollars. The patent was first issued in 1850 for the term of fourteen years, and was twice renewed for terms of seven years. The authorship of the American patent system is discussed, and the credit is allowed to rest between James Madison and William Pinckney. Both offered orders which were allowed to go to the Committee, and a clause finally reported and adopted which embodied the ideas of both gentlemen.

✧ ✧ ✧

The lifeboat invented by Mr J. Mitchell, of Manitoba, was recently launched at Dartmouth, N.S., and tested by Captain Bloomfield Douglas, R.N.R. The boat, which is cigar-shaped, was launched from a wharf 14 feet above the level of the wates. After showing the easy manner in which the boat could be rowed, the crew made a test for the purpose of proving that the boat was self-righting. With the efforts of a number of men pulling on ropes attached to both ends, the boat was overturned. Almost instantly it recovered its proper position. The lifeboat is capable of seating 25 persons comfortably, but can hold more. Since the boat is entirely closed, its occupants cannot perish from exposure. The boat need not be launched from a sinking ship, for it is provided with a suspending rope which runs through its entire length on the interior, through holes at both ends of the boat, and which is attached to the davits. When all the passengers have been received on board the craft, the rope is cut from the inside, so that the boat drops, and is free.

✧ ✧ ✧

A monument was recently unveiled with great ceremony near Junction City, Kan., to mark the supposed site of the famed city of Quivira, which the natives of that section think lies buried beneath their feet. The obelisk is the contribution of the members of the Quivira Historical Society, who are scattered through Kansas, Minnesota, and other North-Western States, the leading spirits of which organisation are J. V. Bower, of St. Paul, Minn., who claims to be the rediscoverer of Quivira, and Robert R. Henderson, of Junction City. The location and even the existence of Quivira has been an active subject of discussion for a hundred years, and much has been written on the subject. It has been located at different times at various places in Mexico, Arizona, and other parts of the South-West, but this is the only location which can lay claim to a substantial monument to mark its supposed site. Those who doubt the existence of the "City of Gold," as Quivira is spoken of, say that the Indians who were supposed to have peopled the city, and who bore the same name, were the poorest tribe known to history.

✧ ✧ ✧

Dr. G. H. Bryan has raised the question of the escape of light gases from planetary atmospheres. The question was suggested by the apparent absence of helium and also of hydrogen from our atmosphere, and the apparent want of a lunar atmosphere, and is exceedingly difficult to deal with; many assumptions have to be made, for instance, as to the temperature of the outer layer of our atmosphere. Prof. Bryan now comes to the conclusion that helium and hydrogen might escape at negligible rates if the mean probable velocity were ten times as large as we assume it to be at ordinary temperatures. In reality there is probably only diffusion of the light gases into the higher strata. Prof. Bryan offered figures as to the amount of hydrogen we should have to generate to keep the quantity of atmospheric hydrogen constant, supposing that it was one of its constituents. Asked whether these two gases would still be in our atmosphere if they had been there when the earth was at high temperature, Prof. Bryan replied that that was a far wider and very difficult problem, since mass would in that period have been much more diffused than now.

✧ ✧ ✧

During last year there has been greater activity in railroad building in the United States than in any twelve months for ten years past. After the extraordinary activity of the period of 1885-1890, when the total construction in one year was about 12.000 miles, there was a rapid decline until 1895, when the small total of 1,428 miles was built. Since that year there has been a steady increase, the total in 1898 being 3,265 miles; in 1900, 4,894 miles; in 1901, 5,368 miles, while in 1902 the total exceeded 6,000 miles. All but a few of the States in the Union participated in this extension. The greatest aggregate length, 570 miles, was laid in Oklahoma; the West, as is natural, being the field of the greatest activity. The second greatest length of road was that built in Texas, where about 500 miles were constructed. Then follow in their order Arkansas, with 370 miles; Indian Territory, with 363 miles, and Georgia with 336 miles. In addition to the total track embraced in these figures, it must be remembered that a considerable length of second track and track for sidings was constructed. There was also a vast amount of reconstruction work carried out which does not figure in this estimate; and this, if recorded, would convey an even stronger impression of the railroad activity of the year.

✧ ✧ ✧

At the recent International Aeronautical Congress at Berlin, Prof. Dr. Assmann, Director of the Aeronautical Observatory of the Prussian Meterological Institute, described his registration baloon of caoutchouc or Para rubber, which was one of the novelties of the meeting. The ordinary ballon-sonde, made of silk or paper and open at the bottom, has the great disadvantage that, when it approaches equilibrium in the upper strata of the atmosphere, its velocity of ascent decreases and the effect of isolation on the thermograph becomes greater, without it being possible to determine afterwards the place where the solar disturbance began during the ascent or where it disappeared during the descent; in fact, it is only in certain cases that we can distinguish between the insolation influence and the curious thermal anomalies that have been described by Teisserno de Bort and Hergesell. The use of a closed balloon made of elastic material has this advantage, that in proportion as the inclosed gas expands the ascensional force is increased so that the balloon rises faster with augmenting height until it bursts and then falls to the ground with diminishing velocity, because checked by a parachute. The time of equilibrium is therefore reduced to an instant, and although the higher the altitude the more intense is the solar radiation and its effect on the thermograph, yet the speed of ascent and descent is also increased, and, consequently, the ventilation, which counteracts the radiation, is likewise stronger. The least possible weight of balloon envelope and of registering apparatus is required, for the lighter the whole apparatus, the less gas is needed, and the smaller the quantity of gas the more it can expand before the envelope bursts at a proportionally greater height.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

DUBLIN, MONDAY, SEPTEMBER 17.

Last Tuesday evening, a gentleman on horseback, was stopped at Inchicore by four footpads, well dressed, who robbed him, and cut the reins of his bridle to prevent pursuit.

Same evening, about eight o'clock, a gentleman's servant was stopped in the Hospital lane, leading to Island Bridge, by the same gang of villains, as is supposed, who stripped him of his surtout coat, and, because he had not more than a shilling about him, beat him most unmercifully.

DUBLIN, TUESDAY, SEPTEMBER 18.

A great resemblance has been observed by travellers in many circumstances between Paris and Dublin, particularly in the disposition of the quays in the two cities. One of the great improvements that are now in contemplation at Paris, is that of opening the quays from one end of the town to the other, and removing all the houses that touch the river; and this would be a most striking and obvious as well as a cheap and practicable improvement in Dublin, particularly the removing the houses in Pudding row. The French also mean to take down the houses on St. Michael's Bridge, which are a great eyesore in Paris.

Yesterday morning presented a fight in this city "nouvelle." A considerable wager had been laid by an officer of our garrison (which was accepted of), that he would at half after eleven o'clock in the forenoon, run from King William, College Green, to the Barracks, with his coat off, in seven minutes; accordingly at the appointed time a number of the military and others attended, and the gentleman ran over the ground in six minutes and a half; but the astonishment of the inhabitants of the different streets through which he passed can be better conceived than expressed, at seeing a party of the military clearing the way with the greatest rapidity, and a man running in the midst of a crowd without his coat through the metropolis at noon day.

Another correspondent informs us an officer of the 15th Regiment of Foot, ran for a wager of one hundred and fifty guineas from the Phœnix Tavern, in Church lane, College Green, to the Foot Barrack Gate; he had seven minutes and a half to perform it in, but accomplished it in six minutes.

Saturday last one Ferguson was apprehended, charged before Justice Wilson for having in company with three others, armed with pistols, stopped a servant belonging to Lord Bellamont on Ranelagh road on Friday night last, whom they robbed of a silver watch.

There never appeared a greater proof of female industry, than that lately furnished by the women confined in the New Prison, in the excavation they had made for the purpose of escaping. The miners of Vauban could not make a more regular sap in a siege, than they did under the foundation of the building, and all without any implement but an old poker, the indefatigable exertion of their hands, and a fund of patient perseverance almost beyond an example.

Yesterday a great number of the military assembled at the front of the New Prison, demanding the release of Richard Allen and William Gardiner, two soldiers belonging to the Royals, who had been confined there for robbing James Foley of his shoes and buckles the night before. They were clamorous, and threatened to force the gaol, in consequence of which the guard there was last night doubled.

There has been an increase of four ounces this week in the assize of bread, and there is a prospect that the increase for next week will be still greater in proportion, for the Canal Corn Market was this day uncommonly great.

Late yesterday evening Mr. Gallagher was stopped on Rathfarnham road by two well-dressed men, one of whom presented a pistol, and robbed him of a guinea, six shillings, and a crown piece coined in the reign of King Charles the First; the latter he requested they would return, which they did, after much earnest entreaty.

This assuredly seems to be the area of Canals in this kingdom, for almost in all parts of it some improvement of the kind is going forward, even in the little town of Bray, in the county of Wicklow, a navigable cut from the sea to the town is nearly perfected, by which the entrance of vessels into its port is much facilitated, and for the dangerous and inconvenient navigation of a paltry creek, a safe and commodious channel is substituted. This useful work is done at the expense of the inhabitants of the neighbourhood, particularly Mr. Grattan, Lords Powerscourt, Meath, etc.

On Sunday evening last an affray happened at the Pigeon House between two sailors belonging to some of the packets in our harbour, when after boxing for a short time, one of them was killed on the spot.

The exportation of butter from the several parts of this kingdom promises this season to be greater than has been known for many years, as the great abundance has enabled the sellers to open the market at six shillings a hundred weight cheaper than last year. Yesterday twelve hundred barrels were exported to Malaga, in Spain.

Last Thursday a physician (coming home from visiting some patients) was stopped in Barrack street, and robbed of what money he had about him, together with his clothes, watch, shoe and knee buckles, hat, wig, and even stripped of his very shirt.

WATERFORD, SEPTEMBER 18.

At the last meeting of the Corporation of this city, the thanks of that respectable body were unanimously voted to the Right Hon. the Earl of Tyrone and the Right Hon. John Beresford, for their having (through their influence) established the mail coming hither by way of Milford, the happy consequences of which are now so evident to this part of the country as not to need elucidation.

DUBLIN, WEDNESDAY, SEPTEMBER 19.

A correspondent informs us that there has been lately established a printing yard on a most extensive scale at Mulmedderin, in the county of Meath (but now called Mesney, after the great printing grounds near Manchester), on the estate of Thomas Pepper, of Ballygarth, Esq., within four miles of Drogheda and three of Balbriggan, under the direction of an eminent calico printer from Manchester, where this branch of business bids fair to be brought to the greatest perfection; the situation, from the excellence of the water, and being contiguous to the great manufactory of calicoes and cottons belonging to one of the most capital houses in this city, is the most happily adapted.

It is observed that the market now completely established on the Quay of the Grand Canal, exceeds the most sanguine hopes of its best friends, as there is actually more grain, flour, and other provisional articles sold at that place, on a weekly average, than at all the other markets, not excepting that of Thomas street. In consequence of an expected increase of business, the company are enlarging their Quay, and preparing to erect an additional number of stores and offices for public convenience, which, when finished, will render the commerce to that of many considerable sea ports, and prove a permanent benefit to the citizens of Dublin.

We hear that the Munster farmers are busy in digging potatoes for a fleet of boats, which will set out for Dublin, both coastways, and by the Grand Canal. When this supply shall arrive, which may probably be about the middle of October, our poor will have no reason to complain, especially as the herring fishery must add to the store. Monopoly and forestalling are the only evils we have to apprehend.

Monday a number of coal porters were taken up for not wearing badges, agreeable to Act of Parliament. Several of them paid and took out badges, and those that did not comply remain in confinement.

The burial place, lately discovered at Killiney, near Bray, must be of a very ancient date, by the manner of the interments; the coffins are made of thin flag-stones, and are regularly laid side by side, and exactly formed like coffins of the present day. Those coffins have no flags at bottom, but are nicely covered at top by the same kind of stone that the sides and ends are composed of; in breadth there were about ten coffins, and by the side of the last were a number of skeletons of people, supposed to have been interred without coffins, but at the same depth in the ground, and regularly laid side by side. When the labourers had dug up one row of them, it was observed they were continued regularly up the hill, and that the head-stones of the first row of coffins were the foot-stones of the next row. How far they are continued has not yet been determined. The skeletons were all perfect at the opening, but by the want of bottoms to the coffins, the clay had got in, which prevents the bones from being taken out whole; the teeth are as perfectly white as the moment they were put into the earth; the other bones are somewhat rotten, and when dry are hard and brittle. It appears to those who have seen them, that they must all have been buried at one time, by their being so exceeding regularly laid down, at an equal length and distance from each other, about two feet from the surface; and it is believed there must have been a battle fought there, and those who were honoured with coffins must have been the chieftains and officers, the others the privates. From the "Cork Evening Post" of Monday last.

"Sunday morning, the 9th inst., an inquest was held upon the body of Timothy Sulivan, weaver, who died in Dunmanway from the effects of a severe beating he received at the fair of Ballabouy on the 6th of August, when the jury brought a verdict of wilful murder against John Morgan, of Kilronane, in the parish of Fanlobbus, farmer. This villain was at the head of a desperate mob, armed with swords, scythes, and pistols; and on Sulivan coming forward, with some others, to preserve the peace, he cut him severely with a hanger, and with a bludgeon gave him several concussions on the head, under which he languished till the 7th inst., and then died. Morgan has since absconded, and is supposed to be lurking in the neighbourhood of Kinsale or Berehaven. It would be an act of signal justice to apprehend him, as he has been charged with two murders before. He is a very tall, swarthy, active fellow, about 32 years of age, with a black beard, and an ill-looking countenance."

We hear from Cove, that the Whiteboys went out on Saturday night or Sunday morning last in large bodies in that town, and the avenues leading thereto.

THE PORT OF KINGSTOWN.

(Formerly known as the Port of Dunleary).

FROM THE HISTORY OF THE COUNTY DUBLIN.—PART I.

By FRANCIS ELRINGTON BALL.

We take the following from Mr. Elrington Ball's valuable History of the County Dublin:—

WITHIN Kingstown Harbour, at its south-west corner, there is a small pier used by colliers. This pier formerly enclosed the harbour of Dunleary, and, up to the time of the construction of the refuge harbour of Kingstown, was the only shelter for vessels on the coast between Wexford and Dublin. Dunleary, a name which is supposed to be derived from the place having been the site of a dun, or fort, erected in the fifth century by Leaghaire, King of Ireland, first came into notice in the time of the Commonwealth as a landing-place for the ships of war, which lay out in the bay. A fishery, which probably had been established in the time of the Monks of St. Mary's Abbey, existed there, and Ludlow mentions that, when leaving Ireland in 1655, he gained the ship in which he was to cross the Channel by means of one of the largest of the herring vessels which lay in the creek below Monkstown. From that time, although Ringsend was the usual place place of embarkation, the creek of Dunleary, which is now crossed by the railway, was occasionally made use of by travellers to or from England, and a quay was built. In the Restoration period, the Earl of Essex, on his arrival as Lord Lieutenant, landed there, and the appointment of an excise officer indicates the increasing importance of the port, which became the constant station of a man-of-war (1).

A poet of the period commemorates the departure from Dunleary, in September, 1709, of their Excellencies the Earl and Countess of Wharton. He describes seeing, from Killiney's craggy height, two warlike vessels, gay with bunting, prepared to carry away the ruler of the land, and how the people gave way to grief and sighs, which he calls on them to suppress, since the destiny of their happy isle is committed to such Lords Justices as the famed Cæsar, General Ingoldsby, and the learned Lycurgus, Lord Chancellor Freeman, who, like comely twins, combined to fight its battles and protect its laws." Swift, who sailed in the Government yacht

in the following year, gives the Dunleary boatmen a bad character, and relates how they made him double their remuneration under threat of losing the yacht, for which he found he was in ample time. In 1741, James O'Hara, second Lord Tyrawley, then Ambassador to Portugal, landed at Dunleary from his Majesty's ship "Lymn," which he had joined at Cork, where he had arrived in the Lisbon packet boat; and, in 1743, Richard Annesley, sixth Earl of Anglesey, landed there, and proceeded to his seat at Bray, on his arrival to defend his title against the claimant, James Annesley. Early in the morning of a September day, in 1753, their Excellencies the Duke and Duchess of Dorset arrived in the bay in the "Dorset" yacht, and were put on shore at Dunleary by their barge about 8 o'clock. They had been expected to land at Ringsend, where great preparations had been made to receive them with concerts of music, guns, and pedereroes. Most of the performers were unable to reach Dunleary in time, but many persons of importance went out in boats to pay their compliments to their Excellencies before they disembarked. On the shore their Excellencies were awaited by the coaches and servants of the Lords Justices, and proceeded to town amongst crowds, who expressed their joy by loud acclamations. The journals of the day specially note the selection by the Duchess of Irish poplin for the material of her dress (2).

Though less fashionable than Newtown Castle Byrne, Dunleary was then a seaside place of amusement. Swift, writing in 1721 to his sub-dean, asks him how often he had been with his wife to Dunleary, and about the same time some verses appeared, which invited the ladies of Dublin to repair in coach or on car to Dunleary, where they would find honest residents and could procure good ale. Such luxuries as meat and wine they were recommended to bring with them. Dunleary was also possessed of at least one good dwelling, known as the Great House. In it probably died, in 1711, Lady Mary Sheares, of Dunleary, daughter of Richard, second Earl of Barrymore, and wife, first of the Rev. Gerald Barry, and secondly of the Rev. Christopher Sheares, of Tanderagee, and in it resided, successively, Lord Tullamore, afterwards Earl of Charleville; Lord Southwell, and Viscount Lanesborough. Later on, Mr. John Carden, ancestor of the Cardens, of Fishmoyne, leased a large place near Dunleary, which comprised lands known as the Seafield, the Rockfield, and the Towerfield, and which were bounded on one side by the sea, and on the other by the high road from Monkstown to Bullock. A fishery still existed—in 1751 the Dunleary fishermen brought to shore a shark, the first ever caught there—but from the hopes expressed that foreign fishermen might be induced to settle near Dublin, and that the city might be then supplied with fresh fish, it cannot have been carried on with much vigour. The inhabitants of the village were, owing to the frequent presence of men-of-war in the bay, constantly liable to be pressed for service in the navy, and in 1757, during an attempt of the kind, shots were fired, and one of the townsmen were wounded (3).

The necessity for building a pier at Dunleary was, in 1775, represented to the Irish House of Commons, in a petition signed by the inhabitants of Dublin. The petition set forth the danger which often attended the navigation of the Dublin port, and the advantages which Dunleary presented as a site for a harbour. The House granted the prayer of the petition, and voted a sum of £21,000 for the erection of the pier. Its erection occupied twelve years, the actual sum expended being only £18,500. Its completion was superintended by the well-known archæologist, General Vallancey. Before it was actually finished, it proved of service. In the summer of 1764, two men-of-war, "The Wasp" and "The Ranger," were repaired alongside, and during storms in the winter of that year seven or eight vessels were safely harboured under its shelter. It was then hoped that when the old quay was taken down, and some rocks at the end of the bay removed, there would be room for twenty sail at a time to anchor under its protection. This anticipation was, however, unduly optimistic. The harbour looked well. Austin Cooper, who probably saw it when the tide was full, describes it as a handsome, semi-circular harbour, enclosed by high banks of gravel, and by the pier, which was about 27 perches long, and which sheltered it from all winds except the north. But for practical purposes it proved, like many of the small harbours since constructed, a complete failure. It soon filled up with sand, which the dredging machines of the time was unable to remove; and, in 1776, a correspondent, styling himself "Hawser Trunnion," drew attention to its inutility, and expressed the opinion that the pier had been built in the wrong direction. The condition of the harbour was brought under the notice of the House of Commons, by a petition signed, amongst others, by Lord Chancellor Hewitt, who was then living at Stillorgan, and by Viscount Ranelagh; and a committee, presided over by Sir Nicholas Lawless, recommended the expenditure of an additional sum of £1,150 upon the pier (4).

The Viceroys and other families continued to make use occasionally of Dunleary on their arrival or departure. There the Duke of Bedford, in 1758, embarked on "The Dorset" yacht, which was convoyed to England by "The Biddefort," of twenty tons, and there again, two years later, having been accompanied from town by the nobility and gentry in their coaches and six, he embarked on the same boat, under convoy of "The Surprise." There landed, in 1780, the Earl of Carlisle, who had crossed from Parkgate, on the Dee, in "The Dorset" yacht, which was commanded by Sir Alexander Schomberg, and convoyed by "The Stag," frigate, and "The Townshend," revenue cruiser; in 1784 the Duchess of Rutland and her three children; in 1787 the Marquis of Buckingham, who proceeded to Mr. Lees' villa; in 1789, the Marchioness of Buckingham, who also went to "The Rock," and in 1790, the Countess of Westmoreland (5).

The packets from England then went to Ringsend, but passengers were sometimes put on shore, by means of boats, at Dunleary, when the wind was contrary. For their accommodation, a coffee-house, remains of which still exist, was opened near the pier. Possibly it was the same house as the one known by the sign of the "Star and Garter," which was, in 1754, advertised to be sold—a house described as fit for any nobleman or gentleman. Dunleary was at that time an inconsiderable and dirty village, the abode of a few fishermen; and the country between it and Bullock was a sterile tract, covered with furze and heath, and traversed by a few footpaths. The principal resident near the village was Mr. William Roseingrave, one of the Secretaries in Dublin Castle, whose house stood on or near the site of Salthill Hotel. He had filled several offices, and belonged to a family renowned for their musical talents. His father had been organist of the Dublin Cathedrals, and his uncle, who died in his house at Salthill, in 1766, was a talented, though eccentric, composer. The house and lands of Dunleary belonged then to Sir James Taylor, Lord Mayor of Dublin in 1765; and another resident of note was the revenue surveyor, Mr. George Glover, who gave elegant entertainments on "The Newtown" barge, and was presented with the thanks of the Corporation of Weavers for his exertions to prevent the smuggling of foreign silks. A humble resident of the name of Lawlor, also deserves record, on account of the extraordinary feat which he frequently performed, about 1760, of swimming from Dunleary to Howth; and an African diver ought not to be forgotten who, in 1783, attracted crowds to Dunleary to see his descents under the sea in a diving bell (6).

Projects in connection with the Mail Packet service from England, which would have affected Dunleary, had been more than once mooted. In 1778, it was announced that a new pier was to be built there, from which all packets were to sail.

In 1790 much conjecture was aroused in the neighbourhood by the packets anchoring in the man-of-war roads, where the mails were put on board by wherries, and, in 1801, there was a scheme to make a deep-sea harbour at Dalkey, and to connect Dalkey with Dublin by means of a canal. But it was not until 1809 that the proposal to construct the present harbour at Kingstown was made. In that year a petition was presented to the Lord Lieutenant, praying that the construction of an asylum harbour near Dunleary should be undertaken by the Government; and six years later an Act was passed authorising the work, at an estimated cost of £505,000. The first stone of the East Pier was laid in 1817, by his Excellency the Earl of Whitworth, and the embarkation from the head of that pier of his Majesty George IV., after his visit to Ireland in 1821, gave origin to the familiar name of Kingstown Harbour. Even at that early stage of its construction, its future utility was foreshadowed. It was on Monday, September 3, late in the afternoon, that the King embarked on his yacht, but, owing to high winds, it was not until the following Friday that he could set out for England. On Wednesday his yacht hoisted sail, and put out along the coast of Wicklow, but she was soon driven back, and was glad to remain under the shelter of the pier until the storm abated. The stone of which the piers are built was quarried out of Dalkey Hill, and was brought to Dunleary in trucks, drawn by horses on four railroads, laid side by side. So fast was the granite poured into the sea that the East Pier is said to have progressed at the rate of 100 feet a month (7).

THE DIPPING SWALLOW.

BY HERCULES ELLIS.

Dipping! dipping!
The swallows plunge beneath the lake:
Dripping! dripping!
Their glossy plumes they gaily shake;
Then mounting, on their new-bathed wing,
O'er woods, and hills, and dales, they spring.

Darting! darting!
They hunt, and seize the summer fly:
Starting! starting!
All birds, in fleetness, they defy;
The lark attempts the race, in vain;
He fails, though every plume he strain.

NEW FRUITS AND PLANTS IN YUCATAN.

The United States Consul at Progreso says that the fields and gardens of Yucatan are filled with useful vegetables and fragrant herbs unknown to the outer world. In the cultivated fields are grown species of Indian corn, beans, squashes and tubers, for which, in this country, we have no name, because we have never seen nor heard of them. In the forests and jungles grow wild fruits, already excellent in quality, which could be made delicious by scientific cultivation. Mr. Thompson, the consul, avers that there are half a score of wild fruits which offer more promising results to cultivation that ever did the bitter wild almond, which was the progenitor of the peach. There are six varieties of Indian corn in Yucatan, and the natives speak of this plant as "the grace of God."

ARE THE OTHER WORLDS INHABITED?

BY REV. C. VAN DER DONCKT.

Are there other inhabited worlds?

Let us take a peep at them.

First the Moon, our satellite. It has no atmosphere. With air and without water, material life is impossible.

Of all the known planets Mercury is the sun's nearest neighbour, although its mean distance from him is over thirty-five million miles. As the period of its rotation is equal to its period of revolution round the sun, Mercury has always the same side turned toward the sun! Consequently its own hemisphere never sees the sun and is, therefore, in perpetual darkness and in eternal winter; whereas, on the other side the sun never ceases darting its fiery rays. Beings that could stand a cold exceedingly more intense than that of our polar regions or a heat of about 1,100 degrees would be the only suitable inhabitants for Mercury. Such should undoubtedly be made of quite different stuff from what we are acquainted with.

Venus, 67 million miles from the sun, is the latter's second closest neighbour. On account of the great inclination of its axis of rotation, there are no temperate seasons on that planet; and as its year lasts only about 244 days there are sudden changes from a burning heat to a cold approaching zero. The sun's diameter appears to Venus one-third larger than it does to the earth. Hence Venus receives twice more light and heat from the sun than we do. None of our equatorial beings would endure such a heat. Still, Camille Flammarion insists on peopling Venus with winged inhabitants who would by periodic flights strive to evade the murderous climate! Beware of grinning at his powerful imagination, else he will class you with "those sleepy minds which in their peaceable march scarcely go beyond the limits of classic timidity."

Mars, the next to be glanced at, is which it most resembles. Its distance from the sun is 141 million miles. Hence it receives only four-ninths, that is, a little less than half, the light and the heat that is shed upon the earth, whose mean distance from the sun is 92 or at most 93 million miles. Animals and vegetables as we have here could not conveniently live there except in the tropics. The remainder would be Siberia. As on our planet, there are clouds, seas, ranges of snow and ice on its continent. But the red colour of the latter is still a mystery. Most astronomers claim that it is the colour of the soil. Herschel maintains that it is owing to the abundance of protoxide of iron. This would prove that there is no life there, as any kind of vegetation would change that red oxide into deutoxyde, which is black. Still, there are many resemblances between Mars and the earth, though they are not so great as romancers of astronomy pretend.

The Asteroids—i.e., star-like minor planets, of which No. 1 (Ceres) was discovered at Palermo by Father Piazzi on January 1, 1801, while Bode and other German astronomers were searching in their country for the missing planet predicted by Kepler—are all very small, the largest being probably only 300 miles in diameter. Most of them are deprived of atmosphere, and their mass (or quantity of matter in weight) is so small that a man of our size would weigh there only about three ounces. He could easily thus by a muscular movement fly through space from one asteroid to another, and should the three hundred and more (No. 31 was discovered on June 11, 1891) of those minor planets wandering between Mars and Jupiter not satisfy him, he might even take a trip to his terrestrial brethren.

Owing to these singularities even the partisans of the plurality of worlds conclude that there is no life whatsoever, either animal or vegetable, in the asteroids.'

Now we arrive at Jupiter, the colossus of the solar system. Situated at 482 million miles from the sun, he has such a high temperature that dense layers of clouds completely obscure his body. It is generally assumed that Jupiter is an extinguished sun, still burning, though gradually cooling down. He has five moons (the fifth was discovered in 1892), and is, according to some astronomers, 1,200, and in the opinion of others 1,390 times larger than the earth. This globe, it appears, is not solid, and if not entirely liquid, it is at least like paste. Father Sechi and other noted astronomers after him maintain that Jupiter and the other three exterior planets, those giants of the solar family, are neither solid nor liquid globes, but nebulous mass in a gaseous condition. Though Jupiter is, according to some astronomers, covered with a liquid mass still half incandescent, the noisy Flammarion, who would make our erstwhile loquacious General Funston take a back seat, insists on peopling that planet with "beings, living in the high regions of the atmosphere, above the fogs and the vapours, feeding on the ethereal fluid, resting on the wind as the eagle in the tempest, and being always in the heights of the Jovian heaven." He who thinks otherwise, writes that famous brewer of rhodomontade, "deserves not to belong to reasonable beings, for he has put a triple bandage over his eyes, and is an obscure mind incapable of rising above vulgar appearances."

When after ages Jupiter will have completely cooled down, as he would receive from the sun twenty-seven times less light and heat than our planet, his mean temperature in the torrid zone would be below zero.

Saturn, 884 millions of miles from the sun, floats in perpetual darkness. On it as on Uranus and Neptune, respectively 1,780 and 2,780 millions of miles from the sun, life for such beings as we know of would simply be impossible, Neptune being completely frozen and the other exterior planets hovering in the zero temperature.

What are the requirements of life? Organic beings absolutely need air, water, and a suitable temperature, else they pine and perish. This is proved beyond the shadow of a doubt by chemistry and physiology. Germs are destroyed in a temperature above 122 degrees, or below the freezing point. Even on our planet living beings are scarce where the temperature approaches those extreme limits. The sandy soil of our torrid zones is a barren and naked desert, like the peaks of our highest mountains and the polar regions. If the burning Sahara still has some remnant of vegetable and animal life, and if there are to be found some cryptogams at a height of several thousand feet and some imperfect organisms even in the glacial sea, it is because the equatorial heat has not dried up all springs, and because the cold scarcely reaches the freezing point. Consequently, if the surface of our globe were a little hotter than our torrid zones, or a little colder than the polar regions, it would certainly be unfit for organic life and would be but a vast desert.

On applying these principles to the other worlds, we are bound to conclude that if material life exists there at all, it can be only in a few of them, and even there in relatively narrow strips. Nor shall wireless telegraphy or still more wonderful relations of human ingenuity, or anything short of Divine revelation, ever inform us whether the Creator has peopled any of those other globes with an intellectual race.

THE TOLKA.

A FAMOUS COUNTY DUBLIN RIVER.

ITS HISTORICAL ASSOCIATIONS.

III.

The Glasnevin Botanic Gardens are bounded on one side by the Prospect Cemetery. At the mouth of the river Tolka we meet another cemetery belonging to the Jews. It was always the custom of that people to bury outside cities; but their Christian neighbours here, as elsewhere, adhere to the revolting and unhealthy practice of crowding the most populous neighbourhoods with corpses. The first extramural Christian burial-ground established in Dublin was the burial-ground of St. George's parish, adjoining the Royal Canal. In 1829, a cemetery principally used by Roman Catholics was established at Golden Bridge. It was originally projected in consequence of an illiberal regulation enforced by Archbishop Magee, prohibiting Roman Catholic clergymen from officiating in it afterwards. It was followed by a cemetery at Harold's Cross. In February, 1832, the cemetery at Glasnevin was opened; it originally comprised only nine acres, but a fraction of its extent now. The approach was formerly filled with public houses, where crowds of mourners betook themselves to the "Cottage of Content," and other taverns, having names contrasting oddly with the vicinity.

The Jewish burial-ground at Ballybough-bridge is of very small size, scarcely exceeding a quarter of an acre. It is of ancient date, probably cotemporaneous with the settlement of Jews in Dublin in the time of Cromwell. It was part of his policy to encourage this industrious people, and in his time there were several of the community in our capital; but their numbers declined, and until the last 30 years there were not enough to keep open a synagogue. It is their custom never to bury one body in the grave over another; and ever since Abraham purchased the field of Machpelah, it has been the passionate desire of his sons to be buried with their fathers; yet this little burial-ground, probably the only Jewish place of sepulchre in Ireland, is not yet full.

From Glasnevin we pass on the river Tolka to Drumcondra. The adjoining church contains the monument of F. Grose, the antiquarian. The following is the inscription, which has the singular merit, for an epitaph, of being literally true:—

"To the Memory of
Captain FRANCIS GROSE, F.R.S.,
Who, whilst in cheerful conversation with his friends,
Expired in their arms without a sigh,
18th of May, 1791.
Aged 60."

He died telling a story after dinner, a short time after his arrival in Dublin, to prepare the learned work which was subsequently finished by Dr. Ledwich.

Up to the year 1716 the tide covered the entire district between Ballybough bridge and the Liffey, near the Custom House, from the street now known as the North Strand, to the North Wall Lighthouse. By an Act of Assembly of the 18th of January, 1716, the Lord Mayor, sheriffs, and citizens, who were owners in fee of the soil, divided the entire of the strand, from the Liffey to the sheds of Clontarf, into convenient plots, and passed a resolution for enclosing and draining it. It was accordingly mapped out, and the various divisions were distributed, by casting lots, among the several members of the Corporation. They were of two classes. Some were called acre lots, which included all except those abutting on the quay intended to be made along the Liffey, which latter were called foot lots. The sums originally appointed to be paid by the allottees were quite insufficient for the intended work; and an Act of Parliament was obtained in 1727, to raise further funds by a tax. At that time the Tolka meandered through the extensive mud, in a course different from that which Annesley bridge has since marked out for it. From the mode in which the enclosure commenced, the district has been all termed "the North Lots."

Parallel to the Tolka, as it approaches this locality, is the road called "Jones's," or "Buck Jones's Road." It was so named after Jones, the celebrated theatrical manager. He lived at a house subsequently called Clonliffe, in which the Catholic Diocesan College now stands, the grounds of which extend from this road back grounds of which extend from this road back to the Tolka. This residence was, in his day, known as "Fortick's Grove"; and he won it in a night's gambling from Lord Mountjoy. He was a favourite with the Duke of Richmond, when Lord Lieutenant. The extravagance and splendour of the entertainments at Fortick's Grove, caused its proprietor to end his days in poverty, but acquired for his house the reputation of great wealth. In the year 1806, while Jones occupied this house, a gentleman named Rammidge, who held a place in the Post Office, resided at the opposite side of the river at Richmond. He used, according to the then common practice, to keep the money which passed through his office in his own hands until settling day, carrying it home to Richmond with him. A gang of robbers, attracted by the grandeur of Fortick's Grove and reputed riches of Rammidge's house, laid a plan of, perhaps, the most extensive robbery ever designed in Dublin —viz., to plunder the entire neighbourhood in a single night. Jones's gardener was, as he alleged, forced to join the plot. Either from repentance or affection for his master, he disclosed to him the night on which the attack was to be made, and that his house and Mr Rammidge's, being considered the principal prizes, would be the first attacked. Jones, in the course of the preceding day, had a detachment of soldiers secretly conveyed into his house, who, with their muskets loaded, were prepared for the robbers' attack. It was arranged that the gardener should wear a signal in his hat, and should be spared if the soldiers fired. Fortick's Grove was the first assailed. The door was accidentally left open, and the gang got into the hall before the alarm could be given. One of them, opening the parlour door, and seeing gentlemen in uniform, fired into the room and wounded an officer. The soldiers, alarmed by the shot, rushed from the upper rooms and kitchens, where they were waiting, and fired from both sides on the crowd of robbers in the hall. Nine of them were shot dead, and several more wounded. Among the dead was the unfortunate gardener, whose signal was not seen in the darkness and hurry. This bloody catastrophe, of course, destroyed the gang. The nine ghastly corpses of the dead men lay for several days, according to the then revolting practice in such cases, at the side of the cross roads, where Jones's road joins Ballybough bridge. None of them were ever claimed, and they were ultimately buried in the corner of the adjoining field. Dead bodies were afterwards found in the hedges in the neighbourhood and Lord Charlemont's plantation, which were ascertained to be the corpses of some who had been badly wounded, and had not strength to escape further.

Near Annesley bridge is ——rino, built by, and the favourite residence of, the accomplished Lord Charlemont, whose pure patriotism and blameless life so well deserved the eminent position he long held in the most brilliant era of Irish politics. At the opposite side lies the classic neighbourhood of "Mud Island." This district was some seventy years ago celebrated as the resort of a character, known as the King of Mud Island. His name was M'Donnell; he owned some household property in the neighbourhood, but was an uneducated man, altogether in the rank of a peasant. He possessed extraordinary influence with the mob. He was guardian of some minor children, and, having been guilty of a contempt of court, an attachment was issued against him; but it was found impossible to execute it by the ordinary means of a bailiff, and, within half-a-mile of the city of Dublin, the sheriff found it necessary to take out a regiment of soldiers and a troop of artillery to arrest this modern specimen of Celtic royalty. His residence was well-known, and he was known to be in it; so the troops advanced to the attack. His Majesty's subjects, of course, immediately assembled in force, but the appearance of artillery, the great mob-queller, kept them quiet. M'Donnell's wife, a second Helen M'Gregor, presented a pistol from the window, swearing she would shoot anyone who dared to enter. In the meantime, he was dressed in woman's clothes, and so effectually disguised himself that he stayed quietly among the crowd, mixing with the soldiers and bailiffs in pursuit of him, while they were breaking open his house. When he had stayed long enough to test his friends, and gratify his taste for excitement, he leisurely walked away. On another occasion the sheriff succeeded in arresting him, and he was almost immediately rescued by a company of coalporters. M'Donnell enforced justice to himself by a more summary method. When a tenant was in arrear, he walked into the house and took and kept whatever he could lay his hands on to the value of the rent. This troublesome monarch died about 1848. He was said to have had three wives; no more than one, however, survived him, and this Queen-dowager of Mud Island died only a few years ago.

Another hero of the same stamp, but without the excuse of humble birth or neglected education, is associated with the river Tolka. Finglas and Clontarf were successively the residence of Bryan Maguire. He was the last of that race of gentlemen (?) of whom Fighting Fitzgerald, Tiger Roche, Pat Power, etc., are well-known examples, whose vices and violence have been too hastily imputed to a larger section of their countrymen, and have so much lowered the English estimate of Irish character. Maguire was descended from an ancient family, to whom the whole county of Fermanagh had once belonged. He boasted his lineal relationship to the chieftain of the sixteenth century, who sent the message to the Lord Deputy, "If your Excellency sends a sheriff to my county, I shall be happy to receive him; but let me know his eric, that I may be prepared to send the proper amount to the Castle of Dublin, when my people cut his head off." The message exhibits a greater respect for the law than appears to have been hereditary in the family. By successive confiscations and continued improvidence, their vast estates were exhausted, and the small patrimony which Bryan inherited was early squandered. He obtained a commission in the army, as his royal descent would not allow him to stoop to any other merely useful employment. He soon left even that. With a prince's pride and a pauper's purse, his position in society was anything but enviable. But he had one friend sufficient to silence the most importunate dun, and cow the most Quixotic acquaintance—and that was his pistol. With this weapon he had acquired such extraordinary skill that he used, with a bullet from it, to snuff a candle held by his wife in her hand, or hit a crown-piece held between her fingers; and so confident was she of his aim that her nerves never dis-

composed it by shaking these extraordinary targets. He had fought numerous duels; his favourite distance was eight paces, at which he could kill or wing his adversary, as it suited his pleasure. Such a redoubtable champion found few willing to encounter him. He had travelled in various parts of the world. It was towards the close of his career that he came to live at Finglas. He resided there for many years, and was a great patron of "the May." He usually appeared in public in a faded half-dress uniform, and was never without his pistols. He was continually beset by bailiffs, by whom he was often unsuccessfully pursued. His overbearing manners and duelling propensities made him shunned, for he had the misfortune to be born too late, when the boast of defrauding one's creditors and shooting one's friends had ceased to be a favourable introduction in society. He took to habits of gross intemperance, which undermined his health and accelerated his total ruin; and the imaginary descendant of kings, the real representative of a house once possessed of princely estates and an honourable name, died an inmate of Kilmainham, a pauper at the debtor's side of the prison.

Yet this bugbear of society was not devoid of some noble qualities. Courage he unquestionably possessed; and this he occasionally used with a generous and laudable object. As an instance, the following anecdote may be cited, which occurred while Maguire was at St. Helena, and which he was fond of recounting. He was one day going up-stairs at a billiard-room, and met a young ensign coming down, crying bitterly like a child. Maguire asked the cause, and the young man informed him that he had been grossly ill-treated by some officers above stairs, who were in the habit of insulting him, because his father was a London tradesman. "Come back with me," said Maguire, taking him by the hand. Entering the room, he met the officers, and asked them, "Which of you will have the courage to insult this young man?" upon which a general attack was made upon him. They drew their swords, and pressed round, crying, "Throw him out of the window," towards which he was backing slowly, with a pistol in his hand (without which he never travelled). The maxim that self-defence is the first law of nature suggested itself to his mind, and, marking a line across the floor, he swore that the first man who crossed it should receive the contents of the pistol in his body. The colonel of the regiment advanced his foot beyond the line, and immediately fell a corpse before him. Maguire was tried for murder, but acquitted upon the grounds that he did the act in self-defence. He had good reason to suppose that the party were in earnest in their threats of throwing him out of the window; and it was so high that the fall would have inevitably killed him.

Near the close of his career, a young gentleman, Sub-Sheriff of Dublin, found himself unexpectedly called upon to execute an habere against the house at Clontarf then occupied by Maguire. There were, at the same time, in the sheriff's hands—as there always were—several writs against Maguire's person. The inexperienced sub was cautioned that the utmost care was required in executing the process, as Maguire would think as little of picking down a sheriff as of shooting a snipe. The sheriff was, however, determined to do his duty. He summoned to his assistance some of the local police, who all appeared to have a timid respect for the redoubted duellist. They cautiously approached the house. The door was slowly opened by an old woman, the only living inmate beside Maguire himself. She implored them, as they valued their lives, not to approach the room in which he lay, or even the first floor, and then hobbled off as fast as her tottering limbs would permit, uttering prayers for their safety and curses at their temerity. The door of the dreaded chamber was riddled with holes, and the opposite wall bore evidence that the balls were not spent before reaching it. One of the police sergeants, whose voice was known to Maguire, commenced the negotiations by stating that the sheriff himself, out of respect to Maguire, had come personally, and that he was acting, most unwillingly, in discharge of a painful duty. After much swearing, and innumerable protestations of his intention to blow out the brains of the sheriff, or the Lord Chief Justice himself, if he dared to disturb him, he was at length made to understand that the writ was not against him personally, but his landlord, or rather against the house. He then consented to let them in. They heard a bolt withdrawn, and a shuffling inside, as of someone rushing back to bed. They entered, and stood in presence of the dreaded hero. He was sitting up in the bed, with a red night-cap, his face unshaven and unwashed, and a pistol in his hand. The sheriff told him his mission; and his gentlemanly manner so won upon Maguire that he consented to allow him to perform his duty, at the same time protesting that it was of his own free will and accord, as no earthly power could bully him. In all these propositions the sheriff prudently and promptly acquiesced; and then hinted that it would be necessary for Maguire to get up and dress himself, as he should, for form sake, leave the house, to enable the sheriff to give possession. The descendant of royalty begged the sheriff to approach, and then whispered to him the difficulty which prevented his compliance. All his clothes were pawned for thirty shillings, and he had not the means of redeeming them. The sheriff at once despatched a policeman for the clothes, and sent another messenger for some whiskey—a stroke of policy suggested by the friendly sergeant. They soon became great friends. The officer of the law sat on the bed beside Maguire, who entertained him with details (which he was fond of giving) of his numerous duelling exploits. One of the few articles in the room was a portrait of George the Fourth hanging over the chimneypiece. Maguire told the sheriff to look over the right eye of this picture. He saw a bullet-hole, and the bullet lodged in the wall. "That," said Maguire, "is my doing. I was lying here, after recovering from a fever. Some friends came to see me; and, seeing me so weak and low, insulted me with their pity. 'Give me my pistols,' said I, 'and I will show you that my hand is as steady as in my best days.' They did so, and told me to hit that spot. You see the result." The sheriff asked permission to extract and keep the bullet as a memento, which Maguire, evidently with much exultation, assented to. The officer soon returned with the clothes; but, when about to depart, a sudden change appeared to come over Maguire. He took a key from under his pillow; his eyes filled with tears. "I have," he said, "but one request to make of you, as I am about to leave this house; I am sure, from your kindness, you will attend to it. Take this key; in that closet you will find the remains of my darling child. Have him buried when I leave this. I have no place to keep him; and, after I am gone, the people here might treat him roughly."

Immediately on Maguire's departure, the sub-sheriff unlocked the door of the closet, which opened off the bedroom in which he found Maguire lying. To his infinite surprise, he found in it the body of Maguire's child, who had died twenty years previously. The unhappy father had himself embalmed the body, and carried it with him from lodging to lodging. That one object had power to melt the hardened desperado, to sober the maddened drunkard; and, as he went forth, houseless, from his last lodging was the sole object of his care.

Maguire had not long left the house when he was arrested by some special bailiffs, charged with the execution of some of the writs against his person. They had heard of the mission of the sheriff, and followed him in the hopes of the opportunity in which they had so often been disappointed before. The unfortunate man was soon afterwards, on the ground of ill-health, removed to Kilmainham, where as we already mentioned, he ended his days.

THE END.

OUR WEEKLY STORY

A SCIENTIFIC BARGAIN.

BY JAMES RAYMOND PERRY.

Professor Gilman heard about the meteorite that had fallen off Marston's farm not far from Oberlin, and passing through that locality on his way back from a visit to the Lick Observatory, he decided to stop and see if arrangements could be made for its purchase by the Urania University. The museum of the university already held an interesting collection of these visitants from undiscovered countries, and Professor Gilman delighted in adding to the collection. The astronomer was the more eager to secure possession of the meteorite for the university because it was rumoured to be not only of unusual size, but also of a somewhat unusual nature. Professor Gilman was ever eager for any new tale to be told of the great outside world of matter—that world infinitely larger that the little world which men explore, and make so great ado over!—and while he entertained no great hopes that the fallen meteorite near Oberlin could tell much that was new concerning the interstellar spaces, yet there was the possibility that it might. And it is possibilities that lure us.

So it happened that on a certain sultry afternoon Mr. Marston drove with Professor Gilman to the place where the far-faring traveller through space had at length found a resting-place.

Farmer Marston was neither poet or dreamer. The wings of his imagination seldom bore him beyond the boundaries of his fertile farm. So far as his fancy went a meteorite that had trailed a billion-mile path through space only to get caught in the meshes of the earth's atmosphere at last and fall upon his farm, was no more than any boulder half buried in the soil—something better gotten rid of than retained. That was his view of the matter before any hint of commercialism entered into the question. But when he discovered that there were persons possessing a discriminating taste in boulders, and that among such persons of taste were some who preferred a boulder dropped from the sky to one thrown up from the bowels of the earth, his view speedily changed, and straightway he began to appraise the sky boulder as somewhat beyond its worth. Timothy Marston had read a comic paper now and then, and he was not to be taken in.

The meteorite had fallen in a field and lay some two hundred yards from the road. As they walked towards the spot, after Marston had hitched his horse to the roadside fence, the farmer noted a thin cloud of bluish white smoke lying along the horizon south of the field. "Those blamed cowboys have started another fire," he said ill-temperedly. "If one of them gets caught doing it, he might as well say his prayers first as last."

Professor Gilman evinced no interest in the question as to when it would be most proper for a cowboy to say his prayers. If questioned he probably would have expressed some doubts about his saying them at any time

"What do you calculate it's worth?" Timothy asked with a shrewd glance at the professor when they stood beside the meteorite.

Professor Gilman's examination of the meteorite proved a mild disappointment. So

far as he could judge it presented features of no greater interest than many others which he had seen. In other words, it had no new story to tell. Still, the aerolite was of good size, and would be a considerable addition to the university's collection. He told Marston what he thought the university would be willing to pay.

But as it was not more than one-fifth of what Timothy Marston had decided the metal to be worth, he shook his head. "I reckon I can do better than that," he said.

Professor Gilman having had no intention of getting the best of Marston, had offered him as much as he thought the meteorite was worth, so now, instead of raising the bid, as Marston expected him to do, he said, "Well, perhaps you can, Mr. Marston. But" he added, "if the supply of these things is limited, the demand for them is limited also."

These words, and the way the professor uttered them, caused a sudden and marked decline in the value of meteorites, as far as Mr. Marston's appraisement went. Professor Gilman's offer was the only one he had thus far received for the boulder—that now looked to Marston's eyes about as cheap as any other boulder—and, what was worse, it might remain the only one. However, Farmer Marston had not read his comic paper in vain, and this bespectacled professor's words and unconcerned manner might be merely a bluff. He wouldn't begin to scale the price of meteorites just yet, thought the subtle Marston.

It was very provoking, however—and disquieting, too—to see how utterly the professor seemed to have lost interest in the meteorite. He scarcely glanced at it after his offer was declined, and as they walked back to where the horse was hitched, he seemed to have even forgotten its existence. Certainly he did not refer to it again, but plied the farmer with many questions about his crops and his methods of farming. "It's amazing what that professor fellow knows!" Marston confided to his wife afterwards. "He knows a darning sight more about farming than I do!"

But this belated burst of admiration for the professor's knowledge did not prevent his feeling at the time keen disappointment at the way the meteorite affair was turning out. Once or twice he was on the point of telling Professor Gilman he could have the meteorite for the sum offered, but each time his native —or acquired—caution, prompted him to wait. It might be a deep game, after all, that the professor was playing! If so, he would come back to the subject of his own accord. So Marston waited.

The cloud of bluish white smoke on the horizon had grown darker and thicker. "Looks as if they'd got a pretty bad fire started,' 'Marston said, glancing towards the smoke. "Hope the wind won't change and blow it up this way. That makes the fifth bad fire we've had in this part of the State since the first of July. There are two or three big ranches south of here, and lots of good grazing land has been burnt over. If they keep on having these fires there won't be anything for the cattle to feed on. Looks as if that fire was down on Foster's ranch."

"Are the fires of incendiary origin?" enquired the professor.

"Um," replied Marston, a little vaguely. Then resuming the conversation where he thought it had broken off, he said, "The fires have all been set, I reckon. Looks as if a gang of cowboys was doing it. Some of the boys on the ranches got to drinking so hard they weren't good for anything, and got discharged. And now I suppose they've got it in for the ranch owners. You can tell the fires were set, plain enough, for when you go to look at the spots where they started, you're sure to find some empty beer bottles, or whiskey bottles, where the fellows held a carousal first."

"If the men were intoxicated, I suppose the fires may have been set accidentally," said the professor, more by way of saying something than because he was interested in the subject.

"That might happen once, but I reckon it wouldn't happen five times agoing," answered Marston.

"It's been so very hot this summer," he continued, "that everything's got dried up, and when a fire once gets started it burns mighty fast."

"It looks as if another fire had got started near by," remarked the professor, who had glanced away from the distant smoke at which Marston was still gazing.

"By Jerusalem!" ejaculated Marston, and whipped up his horse. "That fire's in my north pasture. If it spreads it'll go through 160 acres of wheat!"

Every man on the farm was mustered to the north pasture, and for two hours they fought the fire. Even Professor Gilman took a hand at it. By dint of much exertion the fire was controlled and confined to the grazing land, and the wheat was saved from destruction.

"This is getting to be pretty serious business," Marston said, when the fire was finally under control. "Somebody's setting these fires, and we've got to find out who 'tis. Somebody set this fire. It couldn't have got started any other way."

"Do you suspect any one?" asked the professor.

"Not a soul. Somebody's doing it, but I haven't any idea who."

"There's no one about here who has a grudge against you?" queried the professor.

"I reckon there are enough persons round here who've got grudges against me," Marston said. "The trouble'd be to know which one to suspect!" From which Professor Gilman deduced that Mr. Marston did not enjoy universal popularity in the section in which he lived.

"It ought not to be a very difficult matter to discover who is setting the fires," said the professor.

"Well, they haven't been able to yet, and this is the sixth," answered Marston a little tartly. "But I'd give a good deal," he added, to know who set this last one."

"How much would you give?" the professor asked.

—"Eh?" Marston said. His "good deal" was a very indefinite sum, as it is likely to be with persons who would give a good deal to do or know something.

But the hazy meaning expression had put an idea into the professor's head. "If I should be able to tell you how this fire originated would you let the Urania University have that meteorite as payment for my services?" 'he said.

Since discovering the fire the farmer hadn't thought of the meteorite. But now that it was recalled to his mind it seemed of mightily little value, and he said promptly, "Yes, sir; if you'll tell me who set the fire and prove it. You may have the thing for nothing."

Professor Gilman did not trouble himself to correct Mr. Marston's way of putting it, though, as he had no idea who set the fire it didn't seem to him, if he gained possession of the meteorite on the terms proposed, that he would be getting it "for nothing."

Just then one of Marston's sons and a farm hand came towards them with another man—or boy, rather, as the lad could not have been over sixteen—between them.

"We've got the fellow that set the fire," shouted young Marston as they drew near. "I saw Billy skulking off up by the wheat field just before I caught sight of the fire. He started the fire down there in the hollow, so's 'twould work up with the wind towards the wheat, and then he skedaddled."

"You lie. I didn't do it!" shouted Billy.

"Oh, no, of course not," said young Marston mockingly. "What were you doing down there? May be you'll say you weren't down there next?"

But the boy was silent. It was evident that he was a good deal frightened. His eyes roved from one to another till they reached the professor, and then they rested. Perhaps he thought there lay some hope in the black-coated stranger. Certainly there was no pity to be detected in the eyes of the rest of the group. They seemed to have condemned him as guilty already.

"He's the fellow that did it all right," said the elder Marston to Professor Gilman later. "He owes me a grudge for a thrashing I gave him a few days ago. I caught him thieving in my orchard, and instead of prosecuting him I let him off with a drubbing. And this is the way he took to get even."

Professor Gilman had a talk with Billy, and the boy denied very earnestly that he set fire to the pasture. He said he was on the way from his home to the village, and to save time had "cut across lots" over Marston's land. The reason he ran when he saw young Marston was because Marston had told him if he ever caught him on his land again he would give him another thrashing.

"Can you show me where the fire started and where Billy was when you first saw him?" Professor Gilman asked of young Marston. The young farmer could, and the two walked down to the hollow in the pasture.

"There, you see the blaze began right here," said young Marston. "The wind was from the west, and it worked along up the hill with the wind, spreading out both sides as it went. I saw Billy skulking along by the fence up there just before I noticed the smoke. I was up at the other end of the pasture, with my back turned this way. It was plain enough that Billy had come up from here though. When he saw me he started to run, and went up the other side of the wheat field."

"Would he have gone up that way if he had been going from his home to the village?" the Professor asked.

"Yes, I s'pose he would," young Marston admitted.

"And as for starting to run when he saw you, I suppose the threat of another thrashing might have caused him to do that," said the professor.

"Well, I reckon maybe he was afraid of me," said the young fellow with a grin.

"Would the fire work back against the wind much, do you think?" the professor asked next.

"It might a little, but not much," was the answer.

"Then right in here, before the path of the fire broadens out much, is where you think it started?"

"Yes, sir."

Professor Gilman walked a few steps over the burnt ground, and with a stick he had picked up poked something lying on the blackened earth. It was a broken bottle. The professor gazed at it a moment meditatively. Then he said: "Your father was tell-

ing me to-day that there have been several fires in this locality this summer, and that they have all been set by disaffected cowboys, who have been discharged from the ranches for drunkenness. The presence of whiskey and beer bottles at the spots where these fires originated he cites as proof of the theory. You see this bottle—a beer bottle, I should say. Now, if the beer and whiskey bottles at the other places indicate that cowboys set the fires, why doesn't this bottle indicate that they set this fire?" and the professor glanced keenly at young Marston over his spectacles.

The young fellow laughed. "That sounds all right," he said. "But you see in this case I happen to know 'twasn't a cowboy who left that bottle there. Father and I were working down here yesterday, and we had some root beer in a beer bottle. When father opened it he broke the neck off, and after we drank the beer he threw the bottle away. I remember seeing where it fell, and that's the very spot, right there."

"Ah!" said the professor, "I see. Well, that seems to destroy the cowboy theory pretty effectually," and he turned away. As he did so he glanced towards the sun, now sinking towards the west, but still sending down fierce rays from a cloudless sky.

"It's been a pretty hot summer, your father tells me," remarked the professor. All thoughts of the fire and what caused it seemed to have left his mind.

"Yes, it's the hottest for a good many years,' 'young Marston answered.

When they got back to the house Professor Gilman wanted to see Billy. The boy had been held as a prisoner in the barn, and thither the professor and the elder Marston went. Young Marston had already gone there, and two or tree of the farm hands were there also.

"Billy," began the professor, "why did you set fire to the pasture?"

"I didn't," said Billy.

"How did you do it—with matches?" asked the professor.

"I didn't do it with anything," persisted the boy.

"Or were you smoking; and did you set fire to the grass accidentally?" Professor Gilman asked.

At that Billy only stared. This imperturable assumption that he had set the fire somehow was a bit staggering to the boy.

"You smoke, don't you?" asked the professor, when Billy failed to answer.

"No, I don't," answered Billy shortly.

"Doesn't he smoke?" turning to Marston.

"I reckon not. I've never seen him smoking," Marston answered.

"Do you carry matches with you?" the professor asked next.

Billy shook his head.

"Why didn't you wait and set the fire at night when no one would be likely to see you?" continued the professor.

"I tell you I didn't set it," Billy answered sharply.

"You knew Mr. Marston here"—indicating young Marston—"was working near by, and there were others in the fields near by, also. You must have known some one would see you there and suspect you. Besides, there would be persons to put the fire out as soon as it was started. Don't you think 'twas foolish to go there in broad daylight with men working all around, and set fire to the grass? I should think you would have had more sense than that." The professor spoke rather severely, but back of the spectacles lurked a twinkle, and the boy, who was not foolish by any means, saw it.

"I reckon 'twas sort of foolish," he drawled with a grin. He had suddenly become convinced that the black-coated stranger was friendly towards him.

The Marstons—father and son—both looked uneasy. The ridiculous side of this theory had not struck them until the professor had adroitly presented it.

"Mr. Marston," said the professor, turning to the elder Marston. "Whatever your opinion may be, I haven't the slightest idea that this boy set fire to your pasture."

"Well, if he didn't do it, who did?" demanded Marston crossly. "Can you tell me that?"

Professor Gilman was silent for a moment. Then with great deliberation he said, "Yes, Mr. Marston, I think I can. But you probably will not believe me if I tell you who did it."

"Well, who do you think did it?" questioned the farmer, now more curious than cross.

"You," answered the professor.

At that Marston laughed loud and long, and the others joined him. Billy looked discomfited. Why did this black-coated stranger have to make a fool of himself?

"Of course the idea sounds preposterous," the professor continued, "and I don't mean to say that you actually set fire to the pasture yourself. What I do mean is that I think you were chiefly instrumental in starting a fire there. Your son tells me that yesterday you and he had some root beer there, and that after drinking it you threw the bottle away. We saw that bottle a few minutes ago. It lies at the spot where the fire started.' "

"Well?" said Marston, mystified.

"Well, repeated the professor, "to-day, after the sun got well up overhead, that discarded beer bottle focussed its rays and set fire to the dried grass under it, just as any burning glass might. If the truth were known, all these other fires, which have been attributed to drunken cowboys, probably originated in the same way."

"You don't expect us to believe that, do you?" Marston asked.

"Perhaps not," said the professor slowly. "I don't know that your education and training is such as would make the theory appeal to you. I admit readily, that it is necessarily only a theory. As no witness saw the fire start, of course proof that it started that way is not obtainable."

"I'll tell you what I'll do," said Marston, with a shrewd look on his face. "We've got some more beer bottles just like the one I threw away. I'll put one out in the pasture where the grass didn't get burnt, and see if a fire starts from it. If it does, we'll believe the other one started the same way."

Marston's tone and manner indicated plainly that he thought he had the professor now. He'd show him that all farmers were not fools, ready to swallow any fairy tale. The comic papers had again come to his rescue.

"Very well," said Professor Gilman. "It is fair enough, I suppose, to put the matter to some such test; but if it fails, you must remember that it does not necessarily disprove the theory. The exact condition under which the sun's rays were focussed by the broken bottle might not again be repeated."

"He's backing down," Marston said to his son in an aside, and he chuckled.

A bottle was brought and put in the pasture, but the sun sank lower and lower, and no fire started.

"I didn't suppose a fire would start; the sun is too low," said the professor. "In order to make the test even approximately fair, at least a dozen bottles ought to be scattered on the grass and suffered to stay from early in the day until night."

"All right," said Marston. "We'll do it to-morrow."

The farmer was in good spirits now. Nothing would come of the test he was certain.

Professor Gilman had not intended to stay another day, but now decided to remain and watch the test.

When about a dozen bottles had been scattered in the pasture the next morning, and they were waiting to see if anything resulted from the experiment, Professor Gilman said, "If a fire starts from any one of these bottles you will accept it as evidence that yesterday's fire started the same way, I suppose?"

"Yes," said Marston. He was confident he would not have to accept the fool theory.

"And you will not any longer accuse Billy of setting the fire?"

"No."

"And the university shall have the meteorite without payment?"

"Yes."

"Very good," said the professor.

The sky was as cloudless as on the previous day, and it was hotter if anything. Professor Gilman walked from one bottle to another, and presently paused beside one with a gleam of satisfaction in his eyes. The rays of the sun seemed to be gradually approaching a focus through the glass bottle. The sun mounted higher. But instead of the bright spot under the bottle becoming brighter, it began to fade, and the professor knew the chance of proving his theory with that bottle had passed.

But a few moments later he paused by another bottle.

"See!" he said, pointing down. The rays of the sun had already come to focus in the glass, and even as Marston and the others looked, a thin thread of smoke arose from the dry grass where the rays were concentrated. In another moment the grass broke into a little blaze, and the fire began to creep along up the slope, burning more and more rapidly as it went.

"Well by—Jerusalem!" ejaculated Marston, gazing in open-mouthed astonishment at the phenomenon.

Professor Gilman smiled.

"The meteorite is mine, is it?" he asked.

"Yes, sir, it's yours," Marston answered, awakening from his trance and hastily beginning to stamp out the creeping blaze.

If you ever visit the Urania University the curator of the museum will be glad to point out to you the Marston meteorite, so called, and if he happens to feel good-natured, he will probably tell you how Professor Gilman secured it.

SONNET TO THE LEE.

(From the "Dublin Penny Journal.")

Sweep on—let nothing check thy calm career,
To where thy waters shoot in silence from their cell:
How sweet upon thy grassy margin here
To dream away a life in this sequestered dell!
Here—where the embowering willows o'er thee bend,
And fling their tresses in thy warbling wave,
Where with thy waters' gleam the sunbeams blend,
And seek in thee their golden glow to lave.
On, on—let nothing with thy current jar;
Thy waters stilly sleep let nothing wake;
Thou art too peaceful for the headlong war
Of cataract—let nought presume to break
Thy stillness 'till thou'rt lost amid the boundless sea,
As time amid thy waves, shoreless Eternity.

COLONEL JAMES ROCHE, THE SWIMMER.

Colonel James Roche, or Roch, was a native of Kinsale, and seventeenth in lineal succession from Adam de Rupe, or Roche (one of the Anglo-Normans), who first came over to Ireland in A.D. 1170. Colonel Roche's father and brother were, like all the Roches of that period, devoted adherents of the Stuarts—a devotion which was ill-requited—for even the titled members of the family were so reduced in circumstances that, as vouched for by eye-witnesses, a Lady Roche was seen soliciting alms in the streets of Cork.

When the war of succession broke out James Roche peremptorily refused to cast in his lot with James the Second, and joined the Williamite army, where he soon attained the rank of Colonel. In this capacity he was sent, under General Kirke, to the relief of Derry in June, 1689, where he performed that heroic feat which won him the honourable sobriquet of "The Swimmer." The story of the siege of Derry and of its gallant defence are already well known, and it will be enough to narrate "The Swimmer's" share in it.

General Kirke, having arrived within eyesight of the town, proceeded no further than did former vessels sent to its relief. His vacillating conduct created universal disgust amongst his own subordinates; and when his wish to despatch a letter to the Governor of Derry was made known, not a man stepped forth to undertake the duty, not even when he offered 3,000 guineas to whoever became his messenger.

It was then that Colonel Roche announced his determination to be the bearer of despatches to the Governor of the besieged city, disclaiming, however, at the same time, the reward offered by the Generals.

Amidst the prayers and blessings of his companions, he was rowed in a small skiff down the lough, away from the city. When eleven miles distant from it he stepped ashore, and soon sped on his journey through a tract, where he lay hid till darkness came on. That night the flood gates of heaven seemed to open and pour down torrents on the earth, and, denuding himself of his heavy upper garments, bareheaded and unbooted, he crept forth from his hiding place. He traversed the enemy's camp without observation, and passed unchallenged one guard after another until he reached the waterside. He had now three long miles of river to get over, but the uprising tide bore him swiftly onward, and long before the sun glittered on the Cathedral spire a band of the 'Prentices admitted Kirke's wearied envoy, Colonel Roche, through the ferry gate into the city of Derry.

On the evening after his arrival, as soon as it was nightfall, Roche was again breasting the waters, bearing with him Governor Walker's reply. He passed the long windings of the river in safety, and reached his lair in the forest unharmed, but the clothes he had hidden had been discovered and removed.

It was not long ere pursuers were on his track. Like a hunted deer, he fled before them. For three miles he passed through the forest until he came again upon the waterside. Before he could plunge into the river he found himself in the midst of a troop of the enemy's dragoons, one of whom broke his jaw-bone. The rest tried to grasp him, but his want of clothes saved him. Blood-smeared and disfigured, he leaped into the river, where none were so courageous as to follow him.

Instantaneously a score of bullets plashed in the water, three of which hit him on the arm, breast, and shoulder. Still he struck out. Life and liberty were offered him, but all in vain. More shots were again discharged at him, but without effect. Weakened from loss of blood, he thought it would soon be all over with him. But, perceiving that he was again being borne back to the town, he made one more gallant struggle, and it was successful. He reached land, and was taken up by the grateful burghers, just as he fell down almost a lifeless corpse.

In a few days he was again abroad; and having failed to deliver to General Kirke the Governor's letter, he transmitted by a prearranged system of telegraphy from the Cathedral steeple some news both as to the garrison and his own fate.

More than a month passed by, and Derry was at last relieved.

Roche was ever after known through life as "The Swimmer," and by this title he was distinguished in the records and papers of his family. When King William the Third ascended the throne of England he did not overlook his service, and in answer to a petition declaring that Roche was sent by General Kirke into Londonderry at the time of the siege with notice of the intended relief, and did after great hazard of his life perform that considerable service, swimming up the river into the town, and was forced to stay two nights in the water, and received three wounds from the enemy's shot, which disabled him in body and prejudiced him in his health, the King granted him by patent the ferry of Kinsale, his native town, with all the boats, etc.

Two years afterwards King William made him a grant of all the undisposed ferries of Ireland. This grant embroiled him in law suits, and he made a fresh application, which the King granted, whereby he obtained the forfeited estate of James Everard, of the Co. Waterford, containing 1,321 acres, and various ferries in the counties Waterford, Wexford, Down, Donegall, Limerick, and Mayo, as well as three in his own county, Cork. These last were Kinsale, Donegal, now known as Passage West Ferry. (Donegal was on the Great Island opposite), and Rath Conray, or the East Ferry, at the opposite end of the Great Island in Cork Harbour—the nearest village to which on the county side is called Rathcoursey.

Colonel Roche got further grants of forfeited lands in the eleventh year of William's reign, and after the latter's death the Commons granted him the sum of £3,269 7s 7d out of certain Irish forfeitures, of which he ultimately received about a third. (Condensed from Sir Bernard Burke's "Family Romance," 1853.)

EVOC.

NOTES AND QUERIES.

"KILLYNY OR KILLENY."

TO THE EDITOR DUBLIN PENNY JOURNAL.

Dear Sir.—The following may be of interest to "Inquirer" in your Notes and Queries Column in your journal of 31st January, 1903.

J. M. Brewer, in his valuable book, "The Beauties of Ireland" (1825) tells us that "Killyny or Killeny, a small village, suiate on the coast, at a distance of eight miles from Dublin, is rendered attractive by its picturesque bay. Near this village are some traces of a curious relic of antiquity, to the following information concerning which we are indebted to a judicious work, entitled the "Dublin Examiner," published in 1816. In that work is an etching of a rude stone of mountain granite, deeply inscribed with a circle and a segment of a circle, supposed by the author "to represent the sun and moon," deities of nearly the same size, quite plain," and a stone seat or chair constitute the remains of an ancient temple near the village of Killiny. This temple, not very many years since, contained two other chairs, similar to the one remaining, one of which we have seen in an adjoining field, and was encompassed by a circle of stones, 18 or 20 in number. These stones have since been removed, or are covered with an embankment which appears to have been thrown up round it. The area within the circle has been converted into a kitchen-garden; and, when first turned up, some ornaments, Celts and Spearheads were, as we understand, discovered. About 25 or 30 years ago a number of rude slate coffins, containing skeletons, were found between the temple and the shore; and, about ten years since five large urns of baked clay, containing calcined bones, were dug up in the village of Killyny."

That circus of stone was used by the ancient inhabitants of the British islands for civic purposes—for assemblies of council, judicature, and election—is uniformly believed, on grounds which are stated at some length by the present writer, in the "Introduction to the Beauties of England and Wales."* But in the countries last named we meet with no peculiar vestiges to denote the civil appropriation of such rude structures. In the instance now under consideration it will be obvious that the "Chairs," termed by tradition the seats of the Brenons or Judges, of Ireland, under the legislation of its ancient septs, may have been introduced in later times into the circus habitually venerated.† But we should rather be inclined to consider the whole erection as contemporaneous, and to view the existence of these rude stone seats as an early peculiarity of the country. The conjectural solution of the circular indentations on the single stone noticed by our author is bold, but scarcely fanciful. That the deity, in his attributes of power and benignity, was worshipped by the pagan inhabitants of these islands through the medium of the Sun and Mono, the grandest of his works is not only probable, but is acknowledged on early testimony; and that circles composed of upright stones formed at the same time places of religious and civil ceremony, will hardly be doubted, after a due consideration of the simplicity of ancient manners.

I could give you some further information, but I am afraid I have already taken up too much of your valuable space.—Yours,

A. N. W.

IRISH COUNTY AND FAMILY HISTORIES.

TO THE EDITOR DUBLIN PENNY JOURNAL.

29 Gipsy Hill, Norwood, London,
31st January, 1903.

Dear Sir.—I notice your very interesting and important list of Irish County and Family Histories in this week's "Dublin Penny Journal," and have pleasure of enclosing prospectus of "The Warren Family History and Genealogy," which will enable you to add another to your list.—Yours truly,

THOMAS WARREN, F.R.S.A.I.

Warren.—A History and Genealogy of the Warren Family in Normandy, Great Britain, and Ireland, France, Holland, Tuscany, United States of America, etc. (A.D. 912-1902), with numerous pedigrees. By Rev. Thomas Warren, F.R.S.A., Ireland. London, 1903.

TO A RIVULET.

BY R. F. H.

Ten years, with all their changes, have passed by,
Since last, clear-gliding rivulet, I stood
Beneath the shadow of this pleasant wood,
And gazed upon thy waters. Lullingly,
As then, they slip along; as calm a sky
Purples their devious course; and flowers as bright
As those that laughed in youth's delicious light
Hang their fresh blossoms o'er thy current shy.
But they—the friends who made thy banks so fair,
Thy flowers so beautiful, thy song so sweet—
Ah, where are they? Some, by the hand of care
Untimely bowed, have met where all must meet;
And some, lone-hearted, gladly would repair
To the mute shelter of that last retreat.

* London, 1818.

† Upright stones were regarded with hereditary respect, and were connected with the solemnities of public assemblies among the native Irish, until the final rejection of the Brehon laws in the reign of James I. Spenser, writing in the latter years of the 16th century, observes that "They" (the Irish) "use to place him that shall be their captaine upon a stone always reserved for that purpose, and placed commonly upon a hill. In some of which I have seen formed and engraven a foot, which they say was the measure of their first captaine's foot whereon hee standing receives an oath to preserve all the ancient former customes of the country involable, and to deliver up the succession peaceably to his Tanist, and then that a wand delivered unto him by some whose proper office that is; after which, descending from the stone, he turneth himselfe round, thrice forward and thrice backward. View, etc., p. 11.

THE GALWAY OF THE PAST.

A STREET IN THE CITIE OF THE TRIBES.
AS IT WAS SIXTY YEARS AGO.

THE OLD STREETS & MANSIONS OF GALWAY.

THE STORY OF LYNCH'S CASTLE

The tourist on approaching Galway town perceives evidence that he is in a peculiar district; the dark features and coal-black hair of the people indicate their Spanish descent; and they are, for the most, so finely formed, so naturally graceful, that almost every peasant girl might serve as a model for the sculptor. Passing along the narrow streets, he is startled by greater singularities; houses and remains of "jalousies," and arched gateways, elaborately carved, mingled with modern buildings, indicating the comparatively unchanged "aspect" of the inhabitants and their dwellings; such, for example, as this ancient gateway, through which is seen the aged, venerable, and most interesting church, full of the very singular and picturesque remains of antiquity.* These records of old times are rapidly falling into ruin; only a few small portions of the "walls" remain; even the Moorish eyes and complexions are not as common as they used to be; and probably, in a few years, Galway will have lost its distinctive character. The "remains" are, as we have intimated, very varied in style; they belong, indeed, to no order of architecture, but seem to have been designed according to the whim or fancy of the builder. The observation applies not only to the private residences, but to the public structures.

* From the earliest periods Galway was a famous trading port with Spain; and its merchants supplied nearly all Ireland with wine. The records of the town state that in the year 1615, "upwards of 1,200 tons of Spanish wine was landed here for account of the merchants of Galway." Although this exclusive trade has of late years greatly diminished, it is still carried on to some extent; and we are informed that a gentleman named Lynch a large importer, is the lineal descendant of the merchants Lynch, who for above 400 years have carried on this branch of commerce. Indeed, antiquaries consider the ancient name of the town—Clanfirgail, the land or habitation of the Gael, or merchants—sufficiently indicative of its very early trade. In 1614, Sir Oliver St. John writes thus of Galway—"The merchants are rich and great adventurers at sea;" previously Sir Henry Sidney had described them as "refined, of urbane and elegant manners, and as having contracted no stain from their rude and unpolished neighbours;" and about the same period, old Heylin calls it "a noted empire, and lately of so great fame with foreign merchants, that an outlandish merchant, meeting with an Irishman, demanded in what part of Galway Ireland stood." In an old MS. largely quoted by Mr. Hardiman, its "credit and fame" is attributed to certain "new colonies and septs"—made famous to the world for their trading faithfully. These new colonies consisted of several families who became settlers, "not together, but at different times;" and whose descendants are known to this day under the general appellation of the "Tribes of Galway"—"an expression first invented by Cromwell's forces, as a term of reproach against its natives, for their singular friendship and attachment to each other during the time of their unparalleled troubles and persecutions; but which they afterwards adopted as an honourable mark of distinction between themselves and their cruel oppressors." These families were 13 in number, viz: Athy, Blake, Bodkin, Browne, D'Arcy, Ffont, Ffrench, Joyes, Kirwan, Lynch, Martin, Morris, and Skerrett. From these names it will be obvious that they were of Anglo-Norman descent; and although they in time became "more Irish than the Irish," they were for a long period at continual war with the ancient families of the district. Several curious rules and bye-laws of the old corporation, prohibiting all intercourse with the natives, are yet preserved. In 1518 they ordered that none of the inhabitants should admit any of the Burkes, M'Williams, Kellys, or any other sept into their houses—"that neither O ne Mac shoulde strutte ne swagger through the streetes of Gallway;" and the following singular inscription was formerly to be seen over the west gate—

"From the ferocious O'Flahertys,
Good Lord deliver us."

The history of Galway is full of interest—from the year 1178, when the Anglo-Normans first set hostile foot in Connaught, to the war of the revolution, when the town surrendered, upon honourable terms, to the victorious Ginkle, who had previously routed the Irish forces at Aughrim. During all the terrible contests of centuries, Galway had its ample share of glory and grief; participating largely in the persecutions of the several periods, but maintaining a high character for courage and probity throughout.† Of its old strength as a fortified town, there are, as we have intimated, few remains; but of its former wealth and splendour, as compared with other towns of Ireland, there are many—they exhibit, generally, tokens of the commercial habits of the people rather than of their military character. The house still known as "Lynch's Castle," although the most perfect example now remaining, was at one period by no means a solitary instance of the decorated habitations of the Galway merchants. Nearly every lane and alley contains some token of their grandeur; and over the doorways of a very large number of the dilapidated houses are still standing the armorial bearings, carved in stone, of the early occupiers.‡ So remarkable, indeed, are those "bits" of Spain transferred to the wild West of Ireland, that Mr. Inglis, who had visited the former country a short time previous to his tour in the latter, thus refers to the resemblances he observed between them: "I had heard that I should find in Galway some traces of its Spanish origin, but was not prepared to find so much to remind me of that land of romance. At every second step I saw something to recall it to my recollection. I found the wide entries and broad stairs of Cadiz and Malaga; the arched gateways, with the outer and inner railing, and the court within—needing only the fountain and flower vases to emulate Seville. I found the sculptured gateways, and grotesque architecture, which carried the imagination to the Moorish cities of Granada and Valencia. I even found the little sliding wicket for observation in one or two doors, reminding one of the secrecy, mystery, and caution observed, where gallantry and superstition divide life between them."

† We can scarcely imagine a greater treat to the student of heraldry than a stroll among the streets and lanes of Galway; perhaps in no city of the British empire will he meet with so great and public a display of "coat-armour." Nearly all the old mansions of which there are very many, have all their gates shields in abundance, displaying the arms of the occupant and those of his more immediate connections, in conjunction with their ancient "marks" as merchants—those significant hieroglyphis of commerce and wealth. Not unfrequently the names of the parties are also engrvaed above the shields, and their surrounding scrolls of ornamentally elaborate character, together with the date of the year when sculptured. The ancient inhabitants of Galway, who thus exalted their gates, have affixed to each house an indelible air of aristocratic dignity, which still clings to them, although, in most instances, they are little more than ruined walls, or, if inhabited are the sheltering places of the poorest of the population, who bear with the half-roofed, comfortless home they afford, from stern necessity alone. These melancholy vestiges of fallen greatness, in the mere course of things, must rapidly pass away. Age and neglect are fast hastening the period.

‡ The name Lynch, as either provost, portreeve, sovereign, or mayor of Galway, occurs no fewer than 94 times between the years 1274 and 1654; after that year it does not appear once. The house above pictured was the residence of the family for many generations. It had, however, several branches whose habitations are frequently pointed out by their armorial bearings, or their crest, a lynx, over the gateway. One of its members is famous in history as the Irish Junius Brutus. The mere fact is sufficiently wonderful without the aid of invention; but it has, as may be supposed, supplied material to a host of romancers. The story is briefly this:—James Lynch Fitzstephen was mayor or warden of Galway in 1493; he traded largely with Spain, and sent his son on a voyage thither to purchase and bring back a cargo of wine. Young Lynch, however, spent the money intrusted to him, and obtained credit from the Spaniard, whose nephew accompanied the youth back to Ireland to be paid the debt, and to establish further intercourse. The ship proceeded on her homeward voyage, and as she drew near the Irish shore, young Lynch conceived the idea of concealing his crime by committing another. Having seduced or frightened the crew into becoming participators the youth was seized and thrown overboard. The father and friends of Lynch received the voyager with joy; and the murderer in a short time became himself a prosperous merchant. Security had lulled every sense of danger and he proposed to a very beautiful girl, the daughter of a wealthy neighbour, in marriage. The proposal was accepted but previous to the appointed day, one of the seamen became suddenly ill, and in a fit of remorse summoned old Lynch to the dying bed, and communicated to him a full relation of the villany of his only and beloved son. Young Lynch was tried, found guilty, and sentenced to execution—the father being his judge. The wretched prisoner, however, had many friends among the people, and his relatives resolved with them that he should not die a shameful death. They determined upon his rescue. We copy the last act of the tragedy from "Hardiman's History of Galway":—

"Day had scarcely broken when the signal of preparation was heard among the guards without. The father rose, and assisted the executioner to remove the fetters which bound his unfortunate son. Then unlocking the door, he placed him between the priest and himself, leaning upon an arm of each. In this manner they ascended a flight of steps lined with soldiers, and were passing on to gain the street, when a new trial assailed the magistrate, for which he appears not to have been unprepared. His wretched wife, whose name was Blake, failing in her personal exertions to save the life of her son, had gone in distraction to the heads of her own family, and prevailed on them, for the honour of their house, to rescue him from ignominy. They flew to arms, and a prodigious concourse soon assembled to support them, whose outcries for mercy to the culprit would have shaken any nerves less firm than those of the mayor of Galway. He exhorted them to yield submission to the laws of their country; but finding all his efforts fruitless to accomplish the ends of justice at the accustomed place, and by the usual hands he, by a desperate victory over parental feeling, resolved himself to perform the sacrifice which he had vowed to pay on its altar. Still retaining a hold of his unfortunate son, he mounted with him by a winding stair within the building, that led to an arched window overlooking the street, which he saw filled with the populace. Here he secured the end of the rope—which had been previously fixed round the neck of his son—to an iron staple which projected from the wall, and after taking from him a last embrace, he launched him into eternity. The intrepid magistrate expected instant death from the fury of the populace: but the people seemed so much overawed and confounded by the magnanimous act, that they retired slowly and peaceably to their several dwellings. The innocent cause of this sad tragedy is said to have died soon after of grief, and the unhappy father of Walter Lynch to have secluded himself during the remainder of his life from all society, except that of his mourning family. His house still exists in Lombard street, Galway which is yet known by the name of 'Dead Man's Lane;' and over the front doorway are to be seen a skull and cross-bones executed in black marble, with the motto, 'Remember Deathe—vaniti of vaniti, and all is but vaniti.'"

Although Mr Hardiman has here drawn upon his imagination, we believe there is little doubt of the fact that the son was actually hanged by the hands of the father. The house in which the tragedy is said to have occurred is standing to this day; but the tablet which contains the "skull and cross-bones" bears the date 1624—upwards of a century after the alleged date of the occurrence.

Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

DUNGARVAN, a sea-port, borough, market and post-town, and a parish, in the barony of Decies-without-Drum, county of Waterford, and province of Munster, 22 miles (S.W. by W.) from Waterford, and 97¾ miles (S.W. by S.) from Dublin, on the road from Waterford to Cork; containing 12,450 inhabitants, of which number 8,386 are in the town and borough. This place, formerly called "Achad-Garvan," of the same import as its present appellation, "Dun-Garvan," derived that name from St. Garvan, who in the 7th century founded an abbey here for canons regular of the Order of St. Augustine, of which there are no vestiges. Raymond le Gros, one of the earliest English adventurers, in 1174, brought hither the plunder he had taken in Offaly and Lismore, which he put on board some vessels he found lying at anchor; but, being detained by contrary winds, was attacked by the men of Cork, whom he repulsed with the loss of eight of their vessels, with which he sailed away in triumph. Soon afterwards the town, which then formed the frontier barrier of the dependencies of Waterford, was, together with other territories, totally surrendered to Hen. II. by Roderic, Sovereign of all Ireland; and a castle was erected for its defence by King John, who is also supposed to have surrounded the town with a wall strengthened with towers. The same monarch granted the custody of the castle, and of the territories of Waterford and Desmond, to Thomas Fitz-Anthony, at a yearly rent of 250 marks, but retained the fee in the Crown; during the minority of Edw. I., it was granted to John Fitz-Thomas at a yearly rent of 500 marks, but was subsequently recovered by Edward in a judgment against Thomas Fitz-Maurice, his cousin and heir, and in 1292 given to Thomas Fitz-Anthony. In 1447, the castle, honour, lands, and barony of Dungarvan, together with other extensive territories, were granted to John Talbot, Earl of Shrewsbury; but the unsettled state of affairs during that period prevented the improvement of the town either in extent or importance. In 1463 an act was passed at Wexford, setting forth that, "whereas the lordship of Dungarvan was of old the greatest ancient honour belonging to the King in Ireland, and that by war and trouble, and want of English governance, it is for the most part totally destroyed; for the relief and succour whereof it is ordained that the portreeve and commonalty, their heirs and successors, may have and enjoy all manner of free grants, liberties, privileges, and customs as the tenants and inhabitants of the honourable honour of Clare in England enjoyed, with a further power to take customs of all kinds of mer-

chandise bought and sold within the franchises, as the mayor and commons of Bristol did, to be yearly expended on the walls and other defences of the town, under the inspection of the Hon. Sir Thomas, Earl of Desmond, and his heirs." By another statute of the same Parliament, the entire fee farm of the town was granted to the said Earl during his life. In the 4th of Henry VIII., an act was passed confirming the castle and all its dependencies to the Crown; but in the 26th of this reign the manor was granted to Sir Pierce Butler, who was likewise created Earl of Ossory, and appointed seneschal, constable, and governor of the castle and manor of Dungarvan, into which the Earl of Desmond had forcibly intruded. In the reign of Edw. VI., Robert St. Leger, brother to the Lord-Deputy St. Leger, was confirmed in the government of the castle, to which he had been appointed in the preceding reign, on condition of keeping a proper ward in it; and other constables for the Crown were subsequently appointed with extensive powers and emoluments, to one of whom, Henry Stafford, a commission of martial law, extending over the whole county of Waterford, was directed, in the first year of the reign of Elizabeth. In 1575, the Lord-Deputy, Sir Henry Sidney, came from Waterford to this place, where he was met by the Earl of Desmond, who, with great professions of loyalty, offered his services in reducing the country to obedience; but towards the close of the year 1579, when Sir William Pelham, then Lord-Justice, was at Waterford, the Earl led a large insurgent force to this place, with which the 400 foot and 100 horse, which had been sent against him were unable to contend. In the 2nd of James I., the manor was granted to Sir George Thornton, but subsequently was with the castle, by Act of Parliament, vested in the Earl of Cork, from whom it descended to its present proprietor, the Duke of Devonshire. In the 7th of his reign, James, in reward of the loyalty of the inhabitants during the reign of Elizabeth, granted them a new charter of incorporation; but early in the rebellion of 1641 they broke their allegiance, and took part with the King's enemies; in March, 1642, the town was, however, taken by the Lord President of Munster, who placed in it a royal garrison, but it was soon after retaken by surprise, and the English inhabitants were plundered. The insurgents, while in occupation of this place, exported merchandise to France, and in return received warlike stores for fortifying the town and castle, of which they kept possession till 1647, when they were taken by Lord Inchiquin with a force of 1,500 foot and the same number of horse. The town remained in the possession of the Royalist party till December, 1649, when Cromwell, having abandoned the siege of Waterford, advanced to besiege it; after a regular investment and a few days' siege, in the course of which several neighbouring fortresses were taken by detachments from his army, the town surrendered at discretion. It is said that Cromwell ordered all the inhabitants to be put to the sword, but recalled his mandate in consequence of a female drinking to his health as he entered the town, which, with the exception of the castle and the church, he saved from being plundered by his troops. The charter of the inhabitants was renewed by Richard Cromwell in 1659, and in 1689 a new charter was granted by James II., which, on the accession of William, was annulled.

The town is situated at the head of a spacious bay to which it gives name, on a peninsula formed by the two arms of the bay. The harbour affords good shelter for vessels drawing from 14 to 15 feet of water at any time of the tide; vessels drawing 18 feet of water may enter at spring tides, but larger ships can enter only at or near high water of spring tides. Its situation is peculiarly healthy, from the constant current of air blowing or passing near it, caused by the parallelism of two chains of mountains running nearly east and west, and leaving between them a valley in which the town lies considerably protected from the north winds; in consequence, the cases of sickness are very few compared with the population.

By charter of James I., the parish of St. Mary, and that of Nugent within the ancient liberties, were erected into the borough of Dungarvan. Previously to the Union, the borough returned two members to the Irish Parliament.

There are some interesting remains of the ancient castle, and of the walls and defences of the town; the former are those of a massive keep in a quadrilateral area, surmounted with a wall defended by a circular tower at each angle, and formerly mounted with cannon; the entrance is by a narrow passage under a tower gateway, flanked by circular bastions, and within the enclosure are the modern barracks. Some of the towers of the town walls are still remaining in connection with modern buildings; and to the west of the town is Cromwell's mount, supposed to have been thrown up by his forces while besieging the town. In the Abbeyside division are the ruins of a lofty, square castle, of which nothing more is known than that it was anciently the property of the M'Graths. There are no traces of the abbey founded by St. Garvan, but nearly adjacent to the last-named castle are the ruins of a religious house founded in the 13th century for Augustinian friars, probably by the M'Graths, who, with the O'Briens of Cumeragh, were its chief benefactors. The remains form an interesting pile; the walls, windows, and arches are still entire: the old conventual church consists of a narrow nave and chancel connected by an arch of elegant design supporting a light and enriched tower, 60 feet high and still in good preservation; the entrance, at the west end, is by a small, pointed doorway, and a large east window admits a fine view of the sea; below the window is a tombstone of Donald M'Grath, dated 1400; on the foundation of some of the ancient cells the R. C. chapel of Abbeyside has been erected, the bell of which hangs in the old tower, and the walls and entrances of the ancient abbey are preserved in good order. An hospital for lepers, dedicated to St. Bridget, was also founded here, but nothing further has been recorded of it. At Shandon are two caves in the limestone rock, one on the sea shore, about 40 feet square, with a long passage leading to inner apartments; the other is in the middle of a plain field, near the river Colligan: in both are stalactites. To the west of the town is a large barrow, surrounded by a fosse. Dungarvan gives the inferior title of Viscount to the Earl of Cork and Orrery.

MIDNIGHT IN PHILÆ.

Alone in the light of the midnight hour
I sit on this temple grey,
Where the fleecy snow and the cool-winged shower
Never wander by night or day;
Where the dust of a thousand years, unlaid
By the sprinklings of the sky,
Are piled in its courts; where Osiris' shade
Glides softly with Isis by.
And the Gods of Central Afric stand
All crowned and mitred near,
With sceptres and scrolls from the mystic land,
The dwelling of Hope and Fear.
Disturbed by my footsteps rude from sleep,
A frown sits on their brow;
And their whispers along the dim walls creep—
I hear them, and tremble now!
They scowl on the stranger from northern clime;
But no armed priest appears,
As in those far days of the olden time
When they fed upon blood and tears.
And I lay my hand on the beards of Gods
In their ancient dwelling-place,
Transformed by Time into dark abodes
For the owl and the serpent race.
Behold, over Athor's queenly brow
The dull snail travels slow;
And the Nymph of the Hills and the Virgin Vow
Feels the bat on her bended bow.
Here Typhon, the fratricide, is meek,
His plots and battles o'er;
And the peasant breathes upon Ammon's cheek,
For his thunders scare no more.
But the rushing Nile, in untiring might,
Still rolls his blue waves by;
And the cold stars, robed in trembling light,
Yet love on his breast to lie.
And, hark! as of old o'er Syene's rocks
He pours his thundering tide,
While the Arab, amid his desert flocks,
Sleeps sound on his flowery side.
And lo, where below his fierce wave dashes
In foam o'er the granite isles,
The tropic moonbeam brightly flashes,
Wreathing each crag with smiles.
On the distant waste the antelope bounds,
Companion of Thirst and Fear,
While the yelping of Fancy's swiftest hounds
Comes booming upon her ear.
The river's voice invites in vain,
And the young corn sprouting fair;
She speeds to her desert home again,
Like a meteor through the air.
Home: ah!—that word, like magician's spell,
Creative of woe or bliss,
Bears my soul to its hearth in the Alpine dell,
And my clustering children's kiss!
They are sleeping now, and their sunny dreams
Their father perchance recall,
Wandering beside far tropic streams,
Or through Isis' pictured hall;
And they start with extended arms to press
His much-loved form in vain;
But, hushed by a mother's tenderness,
Relapse into dreams again.
Sleep on, sleep on, my children! soon,
If Love had a prophet's power,
We shall, hand in hand, gaze on yon moon
From the depth of your summer bower.

TO HARNESS THE COLORADO.

Arizona engineers regard the Grand Canyon of the Colorado as affording one of the greatest fields in existence for the development of electricity from water-power. In addition to the immense power of the Colorado itself, large stores of energy are available in the smaller streams that leap into the vast chasm. The plan by which the power of the main stream will, it is now thought, eventually be utilised is that of "picking up" the fall of the river by means of tunnels. At a point about 70 miles north of Williams it is said that a fall of 5,000 feet can be found in a distance but little exceeding a mile.

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

The Second Edition, with Additions.

Chapter IV.

A Description of the Barony of Carbery.

This was the largest barony in Ireland, but it is now divided into two parts, viz., east and west Carbery (1), by a line northwards, from a place called the Leap, near Glandore harbour, to the bounds of Muskery; and has two high constables, one for each division. It is, from Kilbritton to Mizen Head, upwards of 40 Irish miles in length; and was, in former times, of greater extent, as is shown in the first book. A part of this barony divides Ibawne and Barryroe, and forms the bottom of Cloghnakilty bay.

Cloghnakilty (anciently Clowncallow) is a town situated near the sea, which affords it more pleasure than profit; the mouth of the harbour being choked with sand prevents vessels of burden from coming up to the town. It is built in the form of a cross, and here is a decent new church, situated on a rising ground; this is a noted market, on Fridays, for linen yarn, which they bring in from west Carbery in considerable quantities; £30 has been often laid out for yarn in one market day, and £20 is a general computation. Here is also a remarkable fair for all kinds of poultry, on the 29th of September, which supplies Cork, Kinsale, the neighbouring gentlemen, and the shipping in both harbours with great quantities of turkeys, geese, &c. This place was incorporated by the interest of the first Earl of Cork, ann. 2 Jac. I., and is governed by a sovereign and burgesses. The heirs of the said Earl have a power by the charter to appoint the sovereign and recorder, who hold sessions of the peace for the town and liberties, which are extended a mile and a half round the centre. They may have a court of record, and therein implead for any sum not exceeding £20 Irish. The sovereign is feodary, coroner, clerk of the market, master of the say, &c. The method of chosing him is thus: three candidates are returned to the lord of the borough, who, on St. James's day, makes choice of one; and on the St. Luke's day following he is sworn into his office. The late King James, by a new charter, dated July 12, 1688, incorporated this place, and appointed Daniel Mac-Carty, Esq., sovereign thereof, with 24 burgesses; but this charter soon became void.

At the breaking out of the Irish rebellion, ann. 1641, the charter and other records of this borough were saved by Mr. Walter Bird (2), who, at the hazard of his life, escaped with them to Bandon. In the streets of this place (3), two full companies of Lord Forbes's regiment were slain by the Irish, in 1642; and the third company being Bandonians, made good their retreat a full mile to an old fort in the high-way to Ross, which they also maintained till the rest of the regiment, then at Rathbarry, came to their relief; and then they all fell upon the Irish, and killed above 600 of them. This town flourished greatly before the wars of 1641; but being then entirely burned down, it has since but slowly recovered. At present it belongs to the Right Hon. Henry Boyle, and begins again to thrive, by means of the linen trade. About a mile to the north-east of this place, on the lands of Temple-Brien, are the remains of an ancient heathen temple, which I shall give a particular description of in another place.

Six miles north of Cloghnakilty is Iniskeen, a village consisting of about 38 houses. It takes its name, according to tradition, from Kean Mac-Moile-More, ancestor of the Mahonys; it is very large, containing no less than fourscore plowlands, and lies on both sides the Bandon river. In this village they carry on the pernicious trade of distilling whisky spirits. About three miles west there is a manufacture of earthen ware, the clay for which is brought from the county of Kerry. The lands here are mostly under meadow and pasture; there is likewise some corn, and no inconsiderable quantity of flax; but from Iniskeen to the village of Nuce's-town, the country is for the most part mountainy and rocky, being covered over with heath, furze, and fern. To the north of Iniskeen is the ruined church of Kineigh, with a remarkable round tower, above 70 feet high, and 124 feet from the west end of the church; contrary to all others of the kind, the first story is in the form of an hexagon, but the other five stories above it are round. I shall mention more of this tower in another place.

Six miles west of Bandon, a little east of Iniskeen, is Palace-Anne, an handsome, large, well-built house of Roger Bernard, Esq., with kitchen and pleasure gardens, good orchards, and other large plantations. On the south side of the Bandon river is Warren's-brook, a good house with improvements of Mr. Warren. Two miles more west, on the north side of the river, is Connorsville, the house and seat of William Connor, Esq.; the improvements are but in their infancy. On the other side of the river is Pheal, a good house of Mr. Wade; and on the same side is the castle of Ballincarrigy, built by Randle-Oge Hurley, or, as some say, by his wife. In the wars of 1641, this castle (4) was a noted pass, being then esteemed indifferent strong, and was at that time garrisoned by the English. To the south of it is the small castle of Ballinward, also built by the Hurleys.

Some years ago, Sir Richard Cox, by the six days labour only, had a fine level road made to the east of Dunmanway, which was carried two miles through a morass, and is now a pleasant coach road; the old road being hilly, rocky, and a great way about.

Dunmanway is now a pleasant, thriving little town, 12 miles west from Bandon, and the seat of the late Sir Richard Cox, Bart., whose grandfather, towards the end of the last century, undertook to plant an English colony here, directly on the great road leading from Cork to Bantry. King William, to encourage his design, granted him a patent for fairs and markets; and by an Act of Parliament, in the beginning of Queen Anne's reign, the site of the parish church was removed two miles to the projected town of Dunmanway; for the convenience of passengers, an handsome stone bridge was built over the Bandon river. Of late years Dunmanway is become a very thriving place, where the linen manufacture is in a most prosperous and flourishing state, by the patronage and industry of Sir Richard Cox. The house wherein Sir Richard resided is in the midst of the town, and is pleasantly adorned with handsome avenues, and good plantations of fir, elm, lime, chestnut, and some beech. The town is seated in the centre of a small valley, surrounded with hills to the W., N., and S. Those to the north are rough and rocky; but from hence to Bandon, along the river of that name, is a fine, well-improved vale, consisting of a light, gravelly soil. Here are a considerable number of looms at work for linen, as well chequered as white, diapers, fustians, handkerchiefs, girtweb, &c., and the manufacturers were, by several premiums given by their landlord, according to their respective merits, kept constantly employed. A good house, rent free, was given to a master who that year made up the best and greatest quantity of linen; and this

(1) The barony of Carbery anciently extended from Kinsale to the bay of Bantry, or, as an old Irish verse has it, from Carig O-Glavin to Cork. E. and W. Carbery contain 39 parishes, viz., Ballindeghie, a part of Inishannone, Templetown, Ringroan, Kilbritton, Ballymodan, Rathclarin, Kilmolday, part of Timoleague, Disert, Kineigh, Fanlobbus, Kilmihil, Drinagh, Ballymony, Kilmine, Killgariff, Inchydony, Castroventry, Temple-Quinlane, Temple-Amalus, Kilnagross, Ross-Carbery, Kilmac-Abea, Miros, Castlehaven, Creagh, Cape Clear, Affadown, Abbey-Shrowry, Caragh, Drumleague, Durres, Kilcrohane Kilcoe, Scull, Kilfaghnabeg, Kilmore, Tullagh alias Baltimore, the whole being 196,321 Irish plantation acres, making 766 plowlands, viz., 366 in E. Carbery, and 400 in W. Carbery.

(2) MSS. at Lismore.

(3) MSS. Sir Richard Cox.

(4) MSS. Sir Richard Cox.

inscription, in gold letters, was placed over the door of such as deserved this reward:

"DATUR DIGNIORI.
THIS HOUSE IS RENT FREE FOR THE SUPERIOR INDUSTRY OF THE POSSESSOR."

Which board was annually removed with great pomp and solemnity, being called The Table of Honour.

Sir Richard also gave premiums to the apprentices and journeymen, and to the girls of the spinning school, according to their merits. Those who bought and sold the greatest quantity of linen cloth manufactured in this county, at the fair of this place, had premiums also. And so greatly has this manufacture increased since its first settlement in this country but a few years ago, that, in 1748, there were, by a moderate computation, 400 hogsheads of flax-seed sown on this side of the county. But its effects still appear in a stronger light, from the increase of the number of houses and inhabitants in Dunmanway. In 1735 there were not more than 50 very indifferent houses, 12 not inhabited, or by beggars only, and 30 by people who were for the most part poor and idle for want of employment. In May, 1747, there were 87 houses, which contained 250 Protestants and 307 Papists, in all 557; there were reckoned in the town 87 flax-wheels, and 51 woollen-wheels. In May, 1749, the houses were increased to 117, containing 405 Protestants and 402 Papists, in all 807. In all the houses there were 226 flax-wheels and 28 woollen-wheels, besides those of the spinning-school. On the first of May, Sir Richard annually appointed a review of all the wheels, on a pretty green near the town, which makes no unelegant entertainment, to see so many young creatures rescued from want, idleness, and misery, decked out in decent apparel, earned by their industry; and to countenance this review, the young ladies of the best distinction in the neighbourhood exhibited their skill in spinning in this public assembly.

Here are two very good and convenient bleach-yards, that never want full employment. That to the south is supplied with water from an adjacent lake, which is very soft, and is found excellent for whitening linen-cloth.

The parish church is exceedingly well filled on the Sabbath day with a well-looking, industrious, thriving people, who increase so fast that, besides a large gallery erected in it, Sir Richard Cox had thoughts of enlarging it further.

In this church is an handsome monument, with this inscription:

In hopes of a joyful resurrection,
Is deposited the body
Mary, Lady Cox, the beloved wife
Of Sir Richard Cox, knight and baronet
Who was successively Lord Justice of both benches,
Lord High Chancellor of Ireland,
And three times one of the lords justices,
General, and General Governors of this kingdom.
Obiit 1 mo. Jun. 1715.

Happy would it be for many parts of this country if, instead of that spirit of devastation which dairies produce, our villages were thus filled with manufactures, who ought to be supported and encouraged in this manner, by an indulgent landlord, which would in the end produce honour and wealth to him and his dependents.

Sir Richard Cox gave two acres of land, rent free, for building a charter school, and set 18 more at half rent for 990 years, the whole well enclosed. He provided slate and stones for the building, as also labourers, and bestowed £20 per ann. to it. This school is designed for 40 children.

The country to the north of Dunmanway is prodigious rocky; within a mile of the town is a perfect wall or mound of rocks, running a considerable way; a yew tree grows out of the crevices of these rocks, the body of which is 17 feet in circumference, and grows in a reclining manner.

Mohanagh, a mile south of Dunmanway, is the seat of Roger Fenwick, Esq., with two loughs (5) on the south, and a wood to the north. It is observable that in those loughs are a large kind of trout that feed on the spawn of eels.

South of this place, in the parish of Kilroan, are three plowlands belonging to the see of Dublin, granted by King Charles II. in augmentation to that see.

(To be continued.)

(5) Mr Fenwick assured me that on of these lakes, which is called Lough a Drippel, did not frieze in the great frost of 1739.

OUR OWN FIRESIDE.

BY JOHN CLARE.

Our fireside's easy chair—
  Is there any place beside
Where such pleasant cheer we share?
  Where the hours so gently glide?
Though but humble be the fare
  That Want's daily toils provide,
Dainty's cup can ne'er compare
With the joy that sparkles there,
  By our own fireside.

Would you meet with genuine Mirth
  Where she comes a willing guest?
'Tis the quiet social hearth,
  Well I wot, she loveth best;
Where the little ones at play
  Prattle by their mother's side,
And the elder, mildly gay,
Laugh and sing the hours away,
  By their own fireside.

An honest man, though poor,
  Yet may feel an honest pride,
While he tells his troubles o'er
  Where his heart had nought to hide.
He who falls from big estate
  No great grievance hath to bide,
If he calmly meets his fate,
Where Content and Quiet wait
  By the rustic fireside.

They who love us till we die,
  Who through troubles have been tried,
Who will watch the closing eye
  When all grows cold beside—
Where shall friends like these be found,
  Search we earth and ocean wide?
Where, on all this weary round,
Save that hallowed spot of ground
  Called our own fireside?

In my chimney's cosy nook
  Thus I chant my rustic lay,
'Neath the rafters, brown with smoke
  Curling up for many a day.
Wealth may boast his splendid hall,
  Pomp and luxury and pride,
Sculptured roof and pictured wall—
There's no comfort in them all
  Like my own fireside.

THE DUBLIN MOUNTAINS.

On the 27th ultimo the Museum demonstrations were continued in Leinster House, Kildare street. There was a fairly large attendance when Mr. Henry J. Seymour, B.A., F.G.S., proceeded to give a very interesting demonstration on the "Genesis of the Dublin Mountains." He said the purpose of this demonstration was to give an account of the history and origin of the hilly ground to the south of Dublin, and which was familarly known to us as the Dublin mountains. Before discussing this matter it was necessary to get some ideas about mountains in general in order that the special characteristics of the Dublin mountains might be more readily understood. The term mountain is, strictly speaking, not a scientific term, for it is applied to many forms of ground differing one from another in size, structure, and origin. Generally it is applied to any considerable elevation, the word hill being applied to lesser heights. Mountains are divided into three main groups for purposes of classification, known respectively as mountains of circumdenudation, of accumulation, and of elevation. All these types owe directly or indirectly their origin to one prime cause—the contraction of the earth, and the consequent wrinkling of the earth's crust. The outer crust, not contracting as much as the interior, is compelled to accomodate itself to a continually decreasing nucleus. This movement of the crust is always going on slowly, and occasionally suddenly, resulting in the latter case in the production of earthquakes. Evidence that this movement is in progress was then given, and the inferences to be drawn from the formation of raised beaches such as that which connects Howth with the mainland was pointed out. The characteristics of the first two classes of mountains was then demonstrated with the aid of models and drawings. The mode of origin of Laccolites, or large dome-shaped masses of igneous rock, and their structure was then discussed, and an account given of the experiments made recently in America with a view to their artificial production on a small scale. The granite mountains of Dublin were next dealt with. It was pointed out that the evidence of their being Laccolitic in origin is not very satisfactory, but this theory gives a fairly good explanation of the relation which exists between the granite and the Silurian and Cumbrian rocks with which it is associated, at least so far as is at present known. It may be also merely an intrusion on an enormous scale along a line of fissures, occurring along the axis of a Caledonian fold, this term being applied to folds in the earth's crust, occurring with a N.E. and S.W. trend, and produced at or about the beginning of the old red sandstone period. At any rate they are typical mountains of elevation, and belong to the great class forming the majority of the mountain ranges of the earth. The granite forming them originally consolidated deep down in the earth's crust, and is now exposed to view because its former covering has been denuded off by weathering agencies acting during a long period of time. The age of the mountains was then referred to, and the evidence thereanent mentioned in detail. Finally, a short account was given about the granite rock composing the hills, and its structure and mineral composition explained by means of actual specimens of the rock.

A VANISHING PEOPLE.

Mr. Peary says that the tribe of Eskimos living on the shore of whale Sound in Greenland are the most northerly people in the world. Their isolation has differentiated them from all other races. They do not exceed 200 in number, and are being destroyed by an unknown disease which appears to be a slow malignant fever. Lieutenant Peary became personally known to every man, woman, and child belonging to this remote and perishing community of human beings.

LITERARY NOTES.

Mr. Gosse's imaginary English analogue of the Goncourt Academy, if it has interested nobody else, appears to have interested considerably the gentlemen whom Mr. Gosse nominated to compose it. For the majority of them have been moved thereby to put their views in print. They would all naturally welcome the income, and are disposed to consider the dinners favourably, but there their enthusiasm ends. Mr. Gissing deprecates the responsibilities of patronage involved in co-optation; while Mr. Zangwill pleads that he is disqualified because he is or has been a critic—he has even criticised Mr. Gosse.

✧ ✧ ✧

The last issue of the "Ancestor" accused Sir Conan Doyle of certain gross heraldic errors in his romance, "The White Company." The current number of the "Ancestor" contains a reply from Sir Conan Doyle, and comments upon that reply by the "Ancestor's" editor. It must be admitted that in this battle of the experts Sir Conan Doyle comes out second best—nay, he is soundly beaten. The question is one of pure fact, and the professional antiquarian scores. Sir Conan Doyle writes:—

To take a few concrete examples where the editor in accusing me of inaccuracy has been inaccurate himself: he says that the cadency mark of crescents for the second son only came in two centuries later than the date of "The White Company." That date is 1367. The editor will find—and it is a real pleasure to give him some information after all he has given to me—that in a window of the Collegiate Church of St. Mary, Warwick, erected in 1361, the arms of the six sons of Thomas Beauchamp, fifteenth Earl of Warwick, appear differenced with a crescent, mullet, etc. it is probable, therefore, that the custom was perfectly known to the prince's "herald or scrivener."

✧ ✧ ✧

To which the "Ancestor" replies:—

No such window, we believe, exists at the present day, although the figures of the earls sons are found in seventeenth century drawings, at which date there remained some in the window of the choir, and some in the great north window. The choir was not built in 1361, having been begun in pursuance of the will of the Earl, who died in 1369. . . . But Sir Conan's date matters little. What does matter is that, although the younger sons difference their arms, as did many fourteenth-century knights, with small charges, the "cadency mark of the descent for the second son" is not to be found, the second son differencing with a ring

It is pretty obvious that the "Ancestor" is right and Sir Conan Doyle wrong. Sir Conan has been misled by the "makers of bad handbooks." The pity is that Sir Conan Doyle should have thought it worth while to defend himself from experts in a matter which only casually touches actual romance.

✧ ✧ ✧

The objection Matthew Arnold had to being addressed as Professor is well known, for it is embalmed in his best-known preface. How do modern men of letters feel about it? The writer of "Provincial Letters" in the "Cornhill Magazine" quotes in the February number from a friend's diary: "Superior persons jeer at the title of professor, but I think I should like to bear it, provided I professed a recognised science in a recognised university. There is a grave decorum about the word that pleases, only its association with hair-cutting and legerdemain and poetry has undoubtedly a little soiled it. My respected acquaintance, Mr. Booker Washington, who has done so much for the education of negroes, is the subject of a story which throws a grim light on the degradation of the world in the United States. Two New York citizens were discussing his settlement, and one asked the other how he treated him is they happened to meet. "I shake hands and say, 'How d'ye do, Mr. Washington?' "Well," said the other, 'I can't bring myself to call a nigger Mister; I just say, "Good morning, Professor."'

✧ ✧ ✧

I observe (says a literary critic) Mr. Goldwin Smith has been expressing his opinion of a grievance, about which I have had my say from time to time—the grievance of people libelled in fiction. "Personal libel under the term of fiction," (M. Goldwin Smith writes, "is of all kinds the most cowardly and disgraceful. It is absolutely free from the restraint of truth, and the person libelled has no means of vindicating his character. If he resents the calumny, he is said to be putting the cap on his own head." And the amusing thing is that novelists who deal thus lightly with other people's characters and private concerns are indignant at the critic's faintest censure of their published work. In the case of the great writers, there is some compensation in the public gain; much will be forgiven to Thackeray, to Dickens, to Charlotte Bronte, (even by Mr. Goldwin Smith's leave) to Disraeli. But the licence of the smaller fry is a mere iniquity.

✧ ✧ ✧

The ways of advertising are wonderful and sometimes shameless. The following extraordinary communication has been sent to us (says the "Academy") by a correspondent whose name appears to have been got from a directory. At any rate, he knows nothing of the writer. We have the title of the book and the name of the publisher:—

My Dear——,

——'s book is now on sale. . . . Has he, or his brother, mentioned that he has adopted the "nom de plume" of . . . and that the work is entitled . . . .? (published by . . . .)

You might, for Auld Lang Syne's sake, give him a leg-up by inducing friends and the book-agents in your neighbourhood to promote inquiries about his initial effort

As you already know, —— is nothing if not satirical, and in this book his satire has found ample scope. . . . Several of our friends have been caricatured, you yourself not escaping, for there's no mistaking the "original" of his character of C. R.

However, his sarcasm, tho' keen at times, is never spiteful, and I don't think your annoyance will prove lasting.

Trusting you're in the best of health, with kind regards from wife and self,

Yrs. sincerely,

✧ ✧ ✧

In an article entitled "Antiseptic Humour," the "Academy" remarks that the task of the humourist is no longer to laugh at kings, but to laugh at humanity, and with the laughter to bring healing. The post of king's jester, the man who told the truth as a joke has been taken up by men half unconscious of their mission, men such as Mr. Gilbert, Mark Twain, and many others. For democracy has its period of hysterics, just as the palace. We go suddenly mad about æsthetics, or Imperialism. There is a Woman Question. Christian Science comes to the front. A Durbar is held in India, a Coronation in England. America has a difficulty about the Philippine Islands. What is to be said about these things? The world flies into a sudden fury. Only the humourist keeps his head. Our debt to Mr. Gilbert will probably be paid on his tombstone, where people will remember that he saw through æstheticism to the sense that lay behind it. But of course he merely joked about it. He has joked about many things, including the sons of kings.

On the whole we are
Not intelligent,

say the sons of "Gama Rex"; and the Almanach de Gotha is less instructive. But this is not the sort of thing that can be said seriously—in a leading article, for instance. It can be said only in jest. And Mark Twain, who, as we have said, made one big mistake, made one big hit with his nonsense about Christian Science. It could not have been done seriously. But as mere nonsense it is a clean and swift antidote to hysteria.

✧ ✧ ✧

How, then (asks the "Academy"), does Mr. Dooley come out of the ordeal. For we have implicitly placed him in the succession of the humourists who count. The function of the humourist—the world's antiseptic—is to stand aside and watch. Then he must tell what he sees. The inventor of Mr. Dooley has invented a man who looks across a bar in New York and sees the world between him and Mr. Hennessy. Dooley talks of many things, of Arctic Exploration and Swearing, of Books and Woman's Rights, of the End of the Boer War, and the Home Life of Geniuses. He is funny enough. Dooley has been talking long enough now to enable us to be certain of laughter when he faces Hennessy and discourses at large on men, women, and things. One may dip here and there among these "Observations" and get the happy epigram on nearly every page. To take an example or two:—

Hogan says all janiuses was unhappily marrid. I guess that's thrue iv their wives, too.

Ivrything seems to be some kind of wurruk. Wurruk is wurruk if ye're paid to do it, an' it's pleasure of ye pay to be allowed to do it.

I don't think we injye other people's sufferin', Hinnissy. It isnt acshally injyement. But we feel betther f'r it.

I tell ye what, Hinnissy, th' day's Wurruk has broke up more homes thin comic opry. If t' coorts wad allow it, manny a woman cud get a divorce on th' groun's that her husband cared more f'r his Day's Wurruk thin he did f'r her.

A king nowadays is no more thin a hitchin' post f'r wan pollytician afther another. He ain't allowed to move himsilf, but anny crazy pollytician that ties up to him is apt to pull him out be th' roots.

✧ ✧ ✧

There is laughter enough there, continues our contemporary. But it is not enough to be funny in order to perform the antiseptic functions of the humourist. And if—when the laughter is over—you will take those extracts quite seriously, you will find they are really quite serious. The humourist's function—if he is to be anything more than a funny man—is to see things as they are, without passion or prejudice, and to present them as he sees them to an astonished public. Now, Mr. Dooley has much of that intellectual aloofness which is the mark of the great humourist. He sits quietly behind his bar and observes. He does not go to the Coronation; he is not married; he does not hold with reading, but he knows of each of these things "the way an asthronomer knows th' stars. I'm studyin' it through me glasses all the time." He is never carried away by popular enthusiasm, and even Mr. Carnegie's free libraries fail to move him.

Th' thruth is that readin' is the nex' thing this side of goin' to bed f'r restin' th' mind. With mos people it takes the place iv wurruk. A man doesn't think whin he's readin', or if he has to, th' book is no fun.

That is a thing which ought to be said in counteraction of the dim seclusion that the march of mind goes step by step with the manufacture of printer's ink. But one can hardly say it seriously. Too much truth is perhaps dangerous. Enthusiasms, hysterics, delusions have been strangely helpful in the world's history. And a whole generatiion of humourists would probably stand still and laugh at each other. But it is a wholesome tonic to find here and there, and now and then, a man who sees things as they are. The humourist is really but a man who sees a little more clearly than the enthusiast or the dullard, and gets a little nearer to the truth. And the truth well told, is one of the newest things in the world. It brings the shock of surprise.

SCIENTIFIC TOPICS.

According to recent investigations, the chief cause of hostility between ant colonies of the same species appears to be a difference of odour accompanied by a difference in the age of the individuals composing two colonies.

✧ ✧ ✧

Recently fallen rain has the property of rado-activity for several hours after collection; that is, it gives off the so-called Becquerel rays, which are an emanation of matter of a very subtle kind, causing similar phenomena to those produced by X-rays.

✧ ✧ ✧

De Vries, a noted Dutch scientist, has, after long continued experiments, succeeded in producing a variety of clover which has naturally four leaves. Thus it is, a paper remarks, wittily, that science contributes daily to the increase of human happiness and "good fortune."

✧ ✧ ✧

According to M. Spring, of Liege, the blue colour of the sky is due to an electrical agitation of the air. This conclusion he arrived at after a long series of experiments carried on in his laboratory, when he finally obtained, by the application of electricity, a perfectly pure atmosphere in which blue was clearly discernible.

✧ ✧ ✧

According to Professor Ritter, of the University of California, Santa Catalina Island, off the coast of Southern California, is slowly sinking into the Pacific Ocean; while San Clemente Island, which lies south of the former, and San Petro Hill, on the opposite mainland, are slowly rising higher above the level of the sea.

✧ ✧ ✧

It is rumoured that A. Lawrence Rotch, of Boston, is to lend his aid in solving the meteorological problem concerning the permanent circulation of the atmosphere at altitudes greater than 15,000 feet. It is said that the German Government is to furnish Mr. Rotch with a ship equipped for three months' voyage in the tropics. The necessary apparatus and expenses are to be paid for by American scientific men.

✧ ✧ ✧

T. Tardy has studied the oils of Chinese anise, the oil of Japanese anise, and the oil of fennel. He finds that Chinese anise oil contains pinene, phellandrene, estragol, a dextrogyrate terpilenol, anethol, a levogyrate sesquiterpene, anisic aldehyde and acid, together with traces of a crystalline body of the formula C 20 H 22 O 3, and of the ethyl ether of hdyroquinone. The author attaches some importance to the presence of the terpilenol, to which he considers the particular odour of Chinese anise is due. The result of his study of Japanese anise (Illicium religiosum) shows that the oil has a low rotation.

✧ ✧ ✧

The rise of temperature with the depth of a mine is not as uniform as we are sometimes made to believe. There are great exceptions to this rule. At Comstock, Nev., boiling hot water was found at a depth of seventeen hundred feet, but at the two thousand foot level the temperature begins to decrease again, and at a further depth of thirty-five hundred feet a more comfortable temperature is found than there is half way to the surface. At the Calumet and Hecla shaft, in the Lake Superior region, the temperature at forty-seven hundred feet is 79 degrees F., or only 20 degrees warmesr than at a depth of one hundred feet.

✧ ✧ ✧

The Stanford University has received curios gathered by Mrs. Stanford during her long sojourn in Egypt. The collection is interesting, not because it contains many specimens of ancient Egyptian art, but because of its modern historic value. One of the most precious trouvailles of the collection is a set of volumes recounting the history and occupation of the Nile country by the French, and producing in colours the discoveries and conquests of Napoleon. The volumes were compiled by Napoleon's orders in 1812. A set of fine reprints in from twelve to eighteen colours of originals dealing with recent discoveries in the ruins of Karnak also constitute an important part of the collection. Besides these there are cases of gold embroideries, the work of the women of a great harem in Cairo; large numbers of ancient coins, vases, and lamps, statuettes, and bas reliefs of pottery.

✧ ✧ ✧

Princeton University recently received from John M. Clarke, New York State palæontologist, the body of an octupus-like creature, from Onondaga Lake. Dr. Ortmann examined the specimen, and found it to be a cold-water, short-armed squid, a species of devil-fish pervalent along the Atlantic coast from Cape Cod to Newfoundand. The fish was a salt-water specimen, and how it came to be found in fresh water is not easily explained. To be sure, the specimen examined by Dr. Ortmann differs from the ocean-bred squid in that it has not the delicate membranous folds on the arms that stretch out from its body. It may be that these folds constitute a real variation, but Dr. Ortmann is inclined to believe that the mebranes have been lost through abrasions or imperfect preservation. In every other respect the New York squid resembles the ocean kind.

✧ ✧ ✧

It was inevitable that the Rapid Transit East River tunnel, and the North and East Rivers tunnels of the Pennsylvania Road, should stimulate inventors to devise new and better means of tunnelling through silt or other soft material. All the later methods that have been outlined make provision for supporting the weight of the tunnel upon the firm rock bottom underlying the silt. The Chief Engineer of the North River tunnel, Mr. Jacobs, does this by opening the bottom of the tube at stated intervals, and carrying a concrete-filled cylinder pier down to bedrock, the weight of the tube and the trains being carried by two parallel trusses resting upon the piers, and constructed within and on each side of the tube itself.

✧ ✧ ✧

Another system which has recently been patented by Mr. Sooysmith, employs the freezing process associated with timber piling. When tunnelling by this method, a pile foundation is first driven from the river surface throughout the whole length of the tunnel; the material lying just above the piling is then frozen by driving a small pilot tunnel ahead into the surrounding material; and the tunnel is excavated through the material thus frozen, the steel tube resting upon the pile foundation that has been driven for it.

✧ ✧ ✧

The appetite of a whale is phenomenal. His chief diet consists of jelly fish. He has simply to open his mouth and paddle along leisurely in order to take in jellyfish by the wagon-load. Such is the method adopted by the whalebone whale. The sperm whale, on the contrary, captures huge squids weighing often several tons. Like his brother the whalebone whale, he must be constantly on the look-out for food. Otherwise he would starve. As many as fourteen seals have been taken from a thirty-foot "killer." Other fishes of enormous appetites are not uncommon. The bluefish, for example, thrives on sardines and other small fish. Assuming that one bluefish eats ten small fish a day, it has been figured that it requires ten thousand million sardines to feed the one thousand billion bluefish on the American coasts every summer. Most curious of all eaters is the hydra—a strange creature that can be turned inside out, without impairing its appetite or its power to eat.

✧ ✧ ✧

One of the most important discoveries made by the German Oriental Society at Abu Sir, in Egypt, was the find of a perfectly preserved mummy of Jen Em Jechvet, the high priest of the temple, who died about two thousand years before Christ. The body was found in a family vault which also contained the remains of the priest and reader and their wives. Only three tombs of such an age have been found in good preservation during the last century, and this is the first time that the contents have been brought safely to Europe. Jen lay in his coffin, enveloped in a brown linen shroud, just as he had been placed there four thousand years ago. In accordance with the fashion of his time, he has small side whiskers and a longer tuft on his chin, and his eyes are made to appear unnaturally long by means of the careful application of rouge. The wig, which is large and parted down the middle, has a bluish tint verging on green. The mummy was lying slightly on the left side, as Egyptians sleep to-day, and the head rested on a support such as is still in use in the Soudan. The eyes were turned towards the rising sun.

✧ ✧ ✧

The close of November on the Great Lakes usually marks the end of the season of through navigation, and the Government statistics show that for the first eleven months of the past year 77,408 vessels, of over seventy-one millions net tonnage, were reported as arrivals, and 77,899 clearances were reported, of over seventy-two million net tons. There are twenty individual ports on the Great Lakes having a registered tonnage ranging from one million to over five million tons. Cleveland heads the list with 5,637, 282 tons; and five other ports, viz., Duluth, West Superior, Milwaukee, Chicago, and Buffalo, recorded over four million tons of arrivals. The enormous volume of this movement is only appreciated when it is compared with similar marine operations on the ocean frontage. New York, during the entire year 1902, is credited with 8,982,767 tons of arrivals; London had entrances in 1901 amounting to 9,992,753 tons; and Hong Kong reported 8,626,614 tons entering in the year 1900.

In the "Electrical Review" there appears a portion of the diary kept by Samuel F. B. Morse during his earliest work on the Baltimore and Washington telegraph line in 1843. The book was discovered in the library of Thomas A. Edison, at Orange, N. J., and contains what are evidently the first records. The first entry in this diary is dated March 14, 1843, and consists of a copy of the letter from the Secretary of the Treasury, J. C. Spencer, giving instructions as to the handling of the appropriation made by Congress for this experiment. The reply of Morse and other correspondence in the diary give a striking idea of the troubles which beset the pioneer's work, as well as of the untiring energy with which the inventor developed his great ideas. He never seemed to lose heart over the failures of others, which he had to overcome constantly. Under date if August 10, 1843, Mr. Morse describes certain tests he had made, and makes the following interesting prophecy: "The practical inference from this law is that a telegraphic communication on my plan may with certainty be established across the Atlantic. Startling as this may seem now, the time will come when this project will be realised." Commenting on this prophecy and old-time record, which is virtually the story of the beginning of the vast electrical industry of to-day, the "Electrical Review" says:—"How well this prophecy has been fulfilled! To-day there is no ocean unspanned by a telegraphic cable. This old record of the first work in telegraphy takes added interest from our latest accomplishments. We have completed the first Pacific cable, and have made a good start on the second, and Marconi has established communication across the Atlantic without wires. It is difficult to realise that this diary was written less than sixty years ago. Who will venture to predict the electrical developments of the next sixty years?"

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

DUBLIN, MONDAY, SEPTEMBER 17.

Committed to the county gaol this day, by Sir Henry Mannix, Bart., John Murphy, of Knockargan, for having feloniously delivered a notice in writing, threatening a person who had taken his tithe; he was conducted to gaol by the constables of the district of Barrymore, and is the first person committed on the Act of last session, which makes the delivering of any notice, letter, or message, exciting any riot, tumultuous meeting, or unlawful combination death without benefit of clergy.

DUBLIN, THURSDAY, SEPTEMBER 20.

Saturday night last, between eight and nine o'clock, Mr. John Levins, who lives near Glasnevin, on his return home from this city in a one-horse chaise, was stopped near his house by five footpads, armed with pistols, who with horrid oaths and imprecations desired him to deliver his cash, watch, etc., or they would blow his brains out; and having compelled Mr. Levins to come out of the chaise, took from him his watch and a guinea, and stripped him of his hat, wig, shoes, and stockings, and also took a quantity of meat out of the chaise which he was carrying home to the family; they then whipped the horse which galloped off, and after detaining Mr. Levins a considerable time, permitted him to walk home barefooted. Fortunately he had left six guineas in the care of the landlord of a publichouse on the road.

The building of the New Four Courts is now carrying on with the greatest rapidity, and it is thought will be a most superb structure; the great hall will be amply lighted by a spacious dome in the centre of the building, supported by a number of beautiful columns; and each of the Four Courts will open into it; there are also offices to be built at the eastern, similar to those of the western wing, which when completed will be superior to any building of the kind now in Europe.

At this time when the rage for public buildings is so great, the University of Dublin is not dormant in that particular; the workmen are every day clearing away the old building at the north-east angle of the New Square in Trinity College, for the purpose of erecting a chapel and a hall upon that site, the front of which will consist of a portico of four columns of the Corinthian order, exactly similar to the New Theatre now erected on the opposite square; the present steeple is intended to be taken down, and an elegant lofty one erected in a suitable style.

The price of flesh meat has at last suffered a reduction in our markets, but whether it is owing to the abundance brought in, or the paucity of buyers, we shall not pretend to say; prime pieces of ox beef and finest veal being yesterday offered at from threepence to threepence-halfpenny per pound; prime mutton, however, still keeps its ground at fourpence.

Added to the daring robbery of the Cork mail, Mr. Kennedy, Treasurer of the Theatre Royal, Smock alley, on his crossing Dublin Hill, near Cork, was set upon by three villains, well armed, two of whom seized the reins of his bridle, and held pistols to his breast, while the third searched his pockets and took thereout fifty-three guineas in gold and his watch, the latter of which they returned after some debate. Intelligence of the above robbery being immediately forwarded to Cork, two of the villains were apprehended and lodged in gaol by the laudable activity of Mr. Sharpe, high constable. Many other robberies have lately been committed of a similar nature on the same road.

The bridewell in Smithfield (formerly Judge French's house) is fitting up with all possible expedition, for the purposes intended in a House of Correction, properly accommodated. When this is finished, we are informed that it is the intention of the Commissioners of Police not only to order all common prostitutes to be taken up, but also to order all idle vagabonds to be apprehended who cannot give a proper account of themselves, according to the intent and meaning of the Act of Parliament.

On Sunday morning last, about one o'clock, two gentlemen on horseback, who were returning to town from the Curragh, but had stopped to dine on the road, were attacked by four persons armed with pistols, near the Blue Bell, and robbed of three guineas and some silver.

Between the hours of seven and eight o'clock on Monday night, as Mr. John Casey, of Summerhill, gardener, was returning home, he was stopped on the brow of the hill by three footpads, two of them armed with pistols, and the third with a large knife, who cut him under one of his cheeks, and took from him a new hat and nine shillings in silver; then they let him depart. On coming to his place of residence he gave the alarm, and many neighbours having set off in pursuit of the villains, one of them was secured. The prisoner was searched, the knife taken, and Mr. Casey's hat found on his head; they then conducted him to the watch-house of the Rotunda division.

DUBLIN, FRIDAY, SEPTEMBER 21.

We hear that the Grand Canal Company, willing to put their navigation on the most commodious and respectable footing, have it in contemplation to adopt the modes and rules established on the Dutch and Flemish canals, as far as may be consistent with the relative situations of both countries; these chiefly regard the accommodations of passengers and the furniture of the boats, in which the foreign canals have greatly the advantage.

On Monday night, a countryman bringing a hogshead of whiskey from Kilcock, was stopped between Chapelizod turnpike and Island bridge, by three fellows, who demanded what he had got in his pockets. The countryman attempting to slip a small bag into his shoe, was immediately knocked down and plundered of twenty-six shillings, which were sent by several persons to buy different articles, besides thirty-four shillings of his own money. The villains then threatened to pierce the hogshead, and let the liquor run, but the entreaties of the poor countryman prevailed. Single persons, or even more, if not well armed, should be cautious of venturing on that, or Kilmainham road, after seven in the evening, as they are at present infested by an armed banditti, consisting of about twenty desperate men.

DUBLIN, SATURDAY, SEPTEMBER 22.

The Autumnal Equinox has seldom set in with as much violence as at present. About seven o'clock on Thursday evening a dreadful storm of rain and wind arose, which continued with little intermission for twenty-four hours. Much damage has been effected in the city, and the reality of what has been done in our Channel is of a melancholy nature. The "Favourite Nanny," a fine vessel, Capt. Gunderson, bound for Bordeaux, which sailed out on Wednesday, was driven back and struck on the North Bull, where she was seen yesterday evening cutting away her masts, and the sea rolling over her in a most perilous manner. Mr. Foster, a merchant of this city, and several other passengers were on board, but it rolled such a sea, that neither ship nor boat could venture to their relief, so that it was ultimately feared the whole would be involved in the boundless ocean.

Besides the above, a Swede and a Collier were also driven on the North Bull, where, it is said, the collier went to pieces, and a vessel was seen, through a telescope, drifting towards Howth, the men of which were lashing themselves to the mast, but whether she was foundered or wrecked has not yet come to our knowledge. The storm was so dreadful, that not only several houses, but even steeples seemed to shake. The accounts expected from sea occasion fears that are truly alarming.

Thursday night, about nine o'clock, a large leaden tablet, upwards of an hundred weight, on which the arms of Dublin had been embossed, was blown down from the front of the Tholsel into Skinner's row, and though a number of people were passing by at the time, happily no person received any hurt.

The thieves were not unmindful of the opportunity the above storm afforded them, and thought to have reaped a plentiful harvest; for yesterday morning, between the hours of two and four, the house of Mr. Frode, at Clermount, near Glasnevin, was broken open, and robbed of watches, plate, jewels, and other valuable articles to a very considerable amount. The whole neighbourhood was alarmed, in consequence of which a number of persons set out in search of the robbers, a large gang of whom were apprehended in a ditch near Glasnevin, and being severally tied together, they were conducted to Kilmainham Gaol.

The Lord Lieutenant, after having spent some days at Westport, the seat of Lord Altamont, in the county of Mayo, set out for Dunsandle, the residence of the Right Hon. Denis Daly, near Loughrea, in the county of Galway, where he remains at present. He is expected in Dublin next Thursday se'nnight, after having made a circuitous tour, which had taken in, when he reached Westport, little short of 1,900 miles, including his visits to the different cities, towns, and boroughs, besides various seats in their neighbourhood.

It is expected that her Grace the Duchess of Rutland will meet her consort here in the first or second week of the next month, her health being sufficiently established to return to this kingdom.

As a Grand Jury presentment has been made for the rebuilding of Ringsend Bridge, we are to suppose that the long-talked-of project of turning the course of the river Dodder to the eastward of Irishtown, is for the present, at least, abandoned, as a measure whose prosecution would be attended with a certain, and very heavy expense, and its arvantages highly problematical. The Harbour Commissioners, however, have not, we find, lost sight of the gerat loss and inconvenience suffered by the shipping who frequent the port of Dublin, in consequence of that dangerous and destructive bank, called the Bar of Dodder, for which purpose they have for some months employed a number of their gabbards incessantly to drudge or raise the sand and gravel that formed this great obstruction to the navigation of the River Liffey, and happily with such success, that we have the satisfaction to acquaint our readers that the Bar of Dodder is no more, and where this sand bank stood, the water is actually deeper than it is in many other parts of the ship channel, between that place and Poolbeg. The public may form an idea of the labour and attention bestowed on this necessary work, when we inform them that since the beginning of last spring there have been upwards of 47,000 tons of sand and gravel raised there.

Donoghmore Church and Round Tower, Co. Meath.

THE RUINS AS THEY WERE A CENTURY AGO.

From GROSE'S "ANTIQUITIES OF IRELAND," 1791.

The following is the description of the rch and round tower of Donoghmore in se's "Antiquities of Ireland":—

OGHMORE is a small village near Navan, re St. Patrick founded an abbey named etortain, over which he placed St. tin; it was after called Domnach-tor-, and now Donoghmore.

he church is at present ruinous, but one of it remaining. The round tower is ilar to others; the door is to the east, 6 feet from the ground; over it are ptures of our Saviour on the cross. It is on an eminence, not far from the road leading from Navan to Slane.

This view, which represents the south-east aspect, was drawn by Lieutenant Daniel Grose, anno 1792.

In Walsh's "Ecclesiastical History of Ireland," the following particulars of this foundation are given:—

Domnach-mor in campo Ethnach, near Navan. The original church of Donoghmore was built by St. Patrick, who placed there his disciple St. Cassanus, whose relics were preserved in this church and held in the highest veneration fo rages after his death.

A.D. 843 died the abbot Robertagh, the son of Flinn.

The round tower of Domnachmor has a doorway with a figure of the Saviour crucified, sculptured in relievo ,on its keystone, and the stone immediately placed over it; the head of the figure reached the joint of this upper stone, while nearly approaching the curve of the keystone. On each side of the door is a human head carved: the

one partly on the band, and the other outside it. This doorway, placed at an elevation of 12 feet from the base of the tower, measures 5 feet 2 inches in height, and its inclined jambs are 2 feet 3 inches asunder, and 2 feet at the spring of the arch.

This tower is considered to belong to the 10th century. That the round towers are of Christian origin is undeniable. Nowhere are they as yet discovered, unless in connection with the ancient ecclesiastical establishments of the country. If they had been used for other purposes than Christian belfries, or for the worship of fire as some pretended, in ignorance of the early history of the Irish Church, how is it that at Tara, the stronghold of that form of paganism, there is no vestige of any such tower or building? nor at Downpatrick in Tyrawley, another place in which the fire-worship was observed, nor in the islands of Aran, to which the obstinate votaries or priests of the old superstition had fled, sooner than embrace the saving truths of the Gospel? When St. Patrick founded Armagh, there is no record of the existence of a round tower there, while the building of St. Patrick's Cathedral is so accurately described, as well as the office of his "campanarius" or bellman, and if a tower of this description had been converted into a belfry, how is it that such a fact would be unrecorded? When the converted princes gave up their fortresses, as at Fenagh and Killbannon, mention is made of those grants; of the yew-tree, which the apostle planted at Newry, memory is kept in the Irish annals, and if the apostle had consecrated the pagan places of worship to that of the true God, such an act of triumph over the errors of paganism would be faithfully recorded. At Kildare, which took its name from the oak tree growing there at the time that St. Brigid founded her church, there was no round tower until a subsequent period. The worship of fire was carried on in many places over the country, and those places still retain the names which designate the fact, such as Greany, Tomgreany, &c., and in which no traces of the round tower exist.

The annals of Ireland point out the era of the erection of some towers, as at Clonmacnoise and Annadown. In the former establishment is Temple-Finghen and its round tower, which is entered by a doorway from the church, and level with the floor thereof. If some towers remain without vestiges of ecclesiastical buildings attached, be it remembered that many of these churches were built of wood and consigned to the flames by the plundering Danes, who devastated in particular everything sacred.

These towers were used, it appears from the Irish annals, not alone as belfries, but also as places of security for the valuables of the altars in cases of sudden attack, being, by their construction and solidity, capable of resisting every kind of military machine then known, and also fire. They were also in many places, as at Killala, peculiarly adapted for the purpose of signal towers, as well as beacons to guide the weary traveller towards the sacred buildings, where they found religion as well as hospitality practised towards them.

"KOMATICKING" IN LABRADOR.

By ANNETTA HALLIDAY-ANTONA.

"God made this country last!" is a Canadian proverb regarding Labrador, yet, sterile and forbidding as it lies among its fogs and icebergs, this desolate Arctic land has its pleasures, of which a "komatick" ride is not the least.

The komatick is a big sledge, nine to thirteen feet long, two or three feet wide, and eight inches high. It is made of pine wood, with bevelled sides, and instead of being nailed together, the sections of the sledge are sewed in place with coarse salmon-net twine, the holes through which the twine is passed being bored out with a red-hot iron, that they may be smooth and even. Last of all, the komatick is shod with runners of whale's bone, fastened to the sledge by pegs of wood run through gimlet holes and planed smooth. Whales are often found dead on the coast, and the large rib bones are in demand for komatic runners.

It was near the 1st of November, and the youths at the hospitable house where I was spending an Arctic winter waited impatiently for the time when they might introduce me to the long-talked-of sport of komaticking. At last the weather seemed propitious. The first snow-storm, with fierce wind and blinding snow, gave place, after several days, to fixed cold, eighteen degrees below zero, not much for this region, and only the beginning of winter.

The drifts had settled into ridges, and the cold had so hardened the crust that it could be readily walked upon; but just as the dogs were fairly harnessed to the sledge the wind began to blow again, the horizon darkened, the sea beat with broadsides of water upon the rocky beach, and soon the snowflakes and the hail told us that the Labrador hurricane had not yet reached its apex.

The next afternoon the sky cleared, and the day stood forth, bleak, cold, desolate, with ice in the bay solid enough to travel upon, if one heeded the dark-coloured patches of water on the surface of the snow, which told where danger lay.

The eight dogs, harnessed to the sledge by a long, thin thong of sealskin, trotted on with the confidence that only those lean, wolfish Eskimo dogs can show. All were many rods in advance of the sled, and the leader was some distance in front of the others. The boys guided the team by the voice only, but carried in the sledge a "drag" of thick rope to throw over the runners when they wanted to stop, and a long stick to sound the ice to ascertain its safety.

Continuous shouts and crying urged the dogs into a brisk gallop, and soon the hobgoblin arctic turnout was sliding along at a smart pace over the ice and snow of the frozen bay.

The excitement of the trip entered my blood. As we rounded the turn of one sparkling slope, one of my companions spied fresh tracks of ptarmigan in the snow. After leaving the bay, the path lay over low hills, river ice, and snow patches, where the wind had laid the grass and moss bare, and over places flooded with water, where an instant's delay would have sunk the sledge. Over these the dogs, knowing the peril as well as ourselves, passed so rapidly that the danger was behind us before it was realised. I can compare the speed of the dog-sledge with nothing but ice-boating, so swift is the movement.

Up-hill the pace was naturally much slower, but going down left one breathless, and the whining, barking and jumping of the dogs and their evident eagerness to go on, was amusing each time we stopped the komatick.

Our ride had an object besides mere pleasure. It was the cutting of young spruces and firs in the dense patches of evergreen thickets within a twenty-mile circle from home. Most of the trees cut there every year find their way to Ottawa, Quebec, and across the border in time for the decorations of Christmas-tide.

After several make-believe attempts, the day turned out to be fine, with little wind and clear blue sky, and a panorama of boreal-like views presented itself on all sides. The scene was a grand network of ponds and hills, with deep gullies overgrown with dwarf spruce, birch and alder. All exposed rock looked to contain feldspar and quartz.

We met a party of Indians, returning homeward to their birch-bark tents, and stopped to see the partridges, which, stupefied by the cold, had been knocked over in the spruce woods with the end of a gun-barrel; they were good eating, and made an excellent soup. I noticed that the Indians all wore sealskin boots with dogskin tops, the sole having no stiffness whatever, leaving the foot perfectly free to feel its surroundings.

These Indians told us that they were going home to attend to their traps, in which they expected to capture marten, beaver, otter, and Canada lynx, valuable to them for their skins, and that then they would break camp and prepare for the hunt, a large herd of deer having been sighted a day's journey eastward.

Everywhere snow, snow, snow. The cold air, however, was unusually invigorating, and as we swept along, the dogs galloping at full speed, I seemed to be journeying in some fantastic Arabian Nights fashion.

Isolated knobs of ice on far ridges took on a dull glare in the waning afternoon, and a keen appetite and full load of fir-trees decided us to turn homeward. On sped the sturdy dogs, and on leaped the komatick over treacherous spots in the bay. So swift was the motion and so pleasant the excitement that I could have wished that ghostly ride to last all night.

Here the sea was frozen in a mass if icy needles, treacherous and cutting to the dogs' feet; there lay, piled in every position, broken and grotesquely shaped blocks of ice; yonder glimpsed the far-off shores of Newfoundland, an icy plain spreading toward them, with a channel of open water in the distance.

Most of the names of inlets, coves, or hamlets passed bore witness to the influence of the French tongue; Belles Amours Bay, Bonne Esperance Point, the village of L'Anse Loup. It is a land of superstition dense and terrible, of religion simple and fervent. I believe no other region on earth offers such elemental powers, such weird scenes, such impressive hardships.

Just before we reached home a most beautiful aurora presented itself, its beginnings like small pencils of light floating in the air. Soon these pencils united into one long, sinuous band, low down in the atmosphere, and in rapid, waving motion, like streamers undulated by some unseen hand. Again and again it coiled and recoiled itself, like an immense snake, its enormous length spanning the heavens from horizon to horizon, and under its weird luminosity the snow and ice around us gleamed like bubbles of fire. Bathed in its radiance, we glided into the home harbour, drove the dogs into their kennel under the house, and rejoiced in the hot tea and savory fresh pork that awaited us.

We had travelled more than sixteen miles over hummock, hillock, and bay ice in our dog sledge that afternoon.

NATURAL COLOURED SILK.

Recent experiments in France have shown that the yellow and green colours possessed by the silk spun by certain caterpillars are due to colouring matter derived from the food, and passed through the blood of the spinners. By impregnating leaves with artificial colours the experimenters caused some species of caterpillars to produce silk of bright orange-yellow and fine rose hues. By the aid of the spectroscope the presence and nature of coloured pigments in the blood of the little animals was established.

OLD DUBLIN.

ITS HISTORY, CHARACTERISTICS, & MANNERS.

By LADY MORGAN.

I.

The following sketch of Old Dublin—its istory, manners, characteristics, &c.—has eemed to us for two reasons worth disenombing from the pages of the "New lonthly Magazine," in which it appeared the first quarter of the last century—rst, because of the interesting informaon that will be new to many which is ended with what they already know, and econdly because of the vivid and picuresque style of the author, who before er twentieth year had made as Sydney wenson a brilliant name for herself as oet and novelist, and who as Lady Morgan as the author of many literary works hich had a great vogue, and some of hich were savagely assailed by Gifford in e "Quarterly Review." On the other and, speaking of an issue of her collected orks, the "Athenæum" wrote:—"So long wit fascinates, so long as beauty of style as power over the soul, and so long as oodness, gaiety, and dashing spirits are the ascendant, so long may we expect a iblic for the works of the writer."

"Full of state and ancientry."
—Shakespeare.

The ford of the hurdles! The town of the rd of the hurdles!! The brow of the hazelood!!! The place of the black chan-!!!! (1) It would be difficult to trace, in e barbarous simplicity of such descriptive ithets, any sketch of rudiment of the modern d beautiful capital "of the most unhappy untry in the world." Such, however, were e primitive, and not unpoetical names of the sh metropolis—names which go near to overn "the golden palace of Tara," to level the uble wonders of Emania, (2) and scarcely to ve a stick or stone together of that "superb fice" Rath-Eochaiath—the royal seat of the preme kings of Connaught. (3) Annals and nalists have, however, asserted (what in Ireld it is deemed anti-patriotism to doubt), at the Milesians, immediately on their tling in the country, having cleared away e woods, and placed agriculture upon a foot; to which the new light of modern times is but "a darkness visible," erected "sumptuous edifices" (4); which is the less to be wondered at, when it is known that they had, en passant, built the city of Braganza, and studied the principles of architecture under the first pyramid builders or Wyatvilles of Egypt.

It is, however, on historic record, that Henry the Second (as a galanterie de sa part) erected a royal palace in Dublin, "with uncommon elegance, in the Irish fashion (ad modum patriæ illius), of smoothed wattles, in which, with the kings and princes of Ireland, he solemnised the festival of his first Christmas in Ireland." (5) It is probable that wattle architecture was long the Irish Doric order, and that the heroes of the Fionne Erin, the Ossians, the Fingals, and their successors, the O's and the Macs, occupied pretty much such dwellings as are inhabited by their genuine descendants, the Irish peasantry, of the present day. Be it, however, some solace to national vanity, to learn that the rude small grey stone towers, of tenure and defence, raised by the English invaders, were scarcely a degree less barbarous than the fabrics of twigs and hurdles built by the invaded; and this, too, when the Medici, the Strozzi, and Frangipani, the free and anti-feudal citizens of Italy, were erecting their marble and domestic palaces, which are, at this day, the admiration and the wonder of the enlightened world.

The town of the hurdles, on its Dubh-lin or black ford, with its huts of twigs, and humble and unaspiring architecture, attracted the special protection of Heaven, at a very early period of its existence; "for," says Father Jocelyn in his life of the patron and chief of all Irish saints, "St. Patrick, departing from the borders of Meath, and directing his steps towards Leinster, passing the river Finglass, came to a certain hill, almost a mile distance from Ath-cleath, 'the place of the ford,' now called Dublin, and casting his eyes about the place and the land circumjacent, he broke forth into this prophecy: This small village (Dublin) shall hereafter become an eminent city: it shall increase in riches, and in dignities, until at length it shall be lifted up into the throne of the kingdom."

It appears, therefore, that the present glory and splendour of Dublin is of divine origin, referable to none of the laws and circumstances which govern the ordinary progress of cities and societies, but in direct opposition to them all; and as it flourishes in its present beauty and extension, it is an effect without cause: a standing miracle! (6)

Increased in dignities! lifted up into the throne of the kingdom! one part of the Saint's prophecy also remains unfulfilled—"increase of riches!!'

But as Rome was not built in a day, neither was Dublin; and though in the tenth century it was pompously designated "the most noble city" by King Edgar, which, saith he, "with all the kingdoms, and the islands of the ocean, I have by the most propitious grace of God the thunderer, subdued under my power" (for the kings of the tenth, like the kings of the sixteenth century, held "le meme jargon par le meme propos); still this "most noble city" was deemed of so little consequence by the English invaders, that Henry the Second gave it to his good subjects of Bristol, as a sort of "Etrenne," or New Year's gift.

The first symptom of the accomplishment of St. Patrick's prophecy exhibited itself in the erection, by the English Government, of a strong fortress, called "the Castel of Dublin," erected, says the patent, "for the defence of the English entered in Ireland"—a purpose to which it has been most religiously applied ever since.

If the first lay building of lime and stone erected in Ireland obtained the name of the "wonderful castle" (7), the admiration of the simple inhabitants of Dublin may be easily imagined, when, in the midst of their dens of wicker and hurdles, they beheld the gradual elevation of a castle "with stone walls, gate-towers, portcullis, and courtines, a donjon for a State prison, and a waste parcel of land lying round about it;" in a word, just such a quartier-general of despotism, just such a depot of suspicious power, as may be seen, in the present day, in almost all the frontier towns of Continental Europe, but more particularly in Austrian Italy, where the relics of feudality are carefully preserved, under the special care of the Imperial "custode" of that "royal antiquarian society"—the Holy Alliance.

Still, however, with the exception of its fortress castle, and of its ecclesiastical edifices, which for the times were sumptuous and numerous, the Irish metropolis, down to the latter end of the sixteenth century, continued a city of mud and hurdles, unable to furnish forth a commodious or secure residence for the English chief Governor and other English officials, who with their suite of retainers, their guards and councils, were lodged and quartered in the stately halls of the abbeys and monasteries of the capital; which thus imagined the ancient power and wealth of the Church of Ireland, as the huts of

1) Drumchallcorl, Ath-Cliath, Ballyathcliath, i Dubh-lin, or Deblana.

2) "The "Regia Sedes Ultimorum."—See O'Halan.

3) "The palaces of our ancient kings were high-celebrated for their magnificence and the taste their decorations."—O'Halloran's Antiquities Ireland.

Ir. O'Halloran gives a list of the state apartnts of the Irish royal palaces, which may stand comparison with those of the Louvre or Verles. "Besides the palace of Tara, of which the idcuarta was but a state form, there were ers erected for the reception of the different vincial kings (Salle des Rois): Grianan-na-ghean was the palace where the provincial ens were entertained. Realla ne Thileadth the place appointed for the judges, poets, iquaries, and other literati, etc., etc. Caircer N'Guill was the state prison where were ged the hostages which the Emperor (O'Conl took from such of the princes whose fidelity doubted." This Carcere duro of the Irish perof smells a little of the regime of the Aus-n Emperor; however, Mr. O'Halloran assures that many of the principal Irish Carbonari of e times claimed and obtained an old heredi-privilege, "Not to wear any kind of shackles but such as were of gold—hence Or-gi, or the Golden Hostage."—"Antiquities of Ireland."

(5) Patrick Finglass Loquire, chief baron of the Irish Exchequer in the reign of Henry the Eighth, to show his loyalty, and to encourage the King to conquer Ireland all over again (for it appears that the "Irish nation," and particularly the "Irish lordes and gentilmen," were then so rebellious, that all the londe was of Irish sale") points out various facilities of doing so; and incidentally bears testimony to the low state of the architecture in Ireland at the time of the English invasion. "Englishmen have grete advantage to get this londe now, which they had not at the conquest; for at that tyme there was not in all Ireland, out of city's five castles or piles, and now there be five hundred castles or piles." These castles or piles were all "English built," and here mentioned are so many fortresses devoted to the great cause of Irish destruction.

(4) Cambrensis, Chap. 33.

(6) On the taking of Dublin, however, by Earl Strongbow and his traitorous ally, Dermod M'Murragh, King of Leinster, it is said by the curious historiographer† of the Irish King, "The soldiers got good spoile, for the citizens were rich." All these citizens were put to the sword by the advice of the King of Leinster, whose motive for undertaking the siege was the mortal hatred he bore them; "For his father being on a tyme in Dublin, and sitting at the door of an ancient man of the city (an humble and patriarchal position for a king) they (the citizens) not only murthered him, but in contempt buried him with a dog." It cannot too often be impressed upon the modern Irish, that the misfortunes of their ancestors were almost invariably the fault of their disunions; and that Ireland's worse foes, from the English conquest effected by one Irishman, to that, her second conquest—the Union—effected by another, have always been found among her own sons.

† "Maurice Regan: his History of the Invasion," was translated by a contemporary, "his famyliar acquaintance," into French metre. Of the French spoken at that time by the Fitzgeralds, the De Montmoriscos, De Cogans, De Courcys, and De Lacey's, the following program of O'Regan's history is a curious specimen:

"Parsoen demande latinoner
L'moi couta de fin historie
Dunt far ici la memorie
Morice Regan iret celui
Buche a buche parla alui
Mi cest gest endeta
L'estoria de lui me Mostra
Jeil Morice cret Latinner
Al rei re murcheo
Sic cerrai del Bachuller, del Rei Dermodvous, soit couten."

(7) By Roderick O'Connor, 1161.

wicker and hovels of sedge figured the subjection and dependence of the people.

It was in oratories and refectories that the collective wisdom of the nation then assembled, that armed senators took their seats, in the face of cowled monks and hooded friars (of whom it was impossible to clear the gallery when abbots sat on the woolsack, and the crosier was the mace). It was along "long sounding aisles and intermingled graves" that some made their speeches, and others made their souls, while the indissoluble union of Church and State was typified by mitred peers pairing off with mailed commoners; and some patriot proser, a Geraldine or a De Courcey, got on his legs to tell them "right plainly and sharply of their unfitting demeaning," and threatened if they did not mend their manners "that they would become Irish every one of them"—without the least regard to the House or fear of being called to order.

Churches and cloisters were then the scenes of all the ceremonies and pageantry, which in modern times are exhibited in palaces and courts (8). It was in Christ Church that Lord Deputy Kildare did homage, and took the oath of office to Sir Richard Edgecomb (9) the King's Minister, and went in state from thence to St. Thomas's Abbey (O'Neil carrying the sword before him), in which abbey he entertained the nobility and King's Commission.

It was in the spacious apartments of the priory of Kilmainham, that the Lord Deputy Sussex held his Viceregal Court, and received the homage of Irish toparchs, and English Pale-lords; and that mirror of magistrates, and model of Irish Viceroys, Sir Henry Sidney, having landed at Monkstown, and stopped to take a stirrup cup 'at the house of one Fitzwilliam of Merryon," entered the city in state, and "proceeded forthwith to his lodging in St. Mary's Abbey."

Many of the great monasteries had then their "chamber of presence," or "the king's chamber"; and "the commons' house" was an epithet applied to an old apartment in the Cathedral of St. Patrick, even down to those times when a House of Commons had ceased to exist in the realm.

The dissolution of all monasteries, and the forfeiture, or rather the transfer, of their immense revenues to the ecclesiastical princes of the new Church, at the time of the Reformation, dissolved the rites of hospitality between Abbots and Viceroys; the latter of whom, probably, long lamented the loss of that "right good cheer," which the jovial monks of Kilmainham and St. Mary's so sumptuously dispensed. Sir Henry Sydney, however, was the first Lord Deputy who removed from his "snug lying in the abbey," and took up his residence in the "castel." Previous to his departure, he took special care to erect "certain lodgins, and other fair and necessary roulmes, both for a convenient plaice for the Lord Deputy, and receaving of ony Government hereafter, as for the better and more commodious resort and assembling of the councaill, and greater ease of all suitors, boath rich and poore, which heretofore were accustomed to travail to and from plaices, both farder distant, and less commodious for the dispatch of their causes; and for the keeping of the said house and roulmes newly erected, and swepping and keeping clane the walkes upon the walls and platforms, as for the tending and keaping of the clock within the castel, an honest, careful, and diligent person was appoynted, with the fee or enterteynment of sixteen pence currant money of Ireland per day, and withall a convaynient roulme for his lodging within the sayd castel at the assignment of the Governour for the tyme being."

Ye ploughers of the half-acre of modern times, behold here in the "suitors boath rich and poore," that haunted the castel in Elizabeth's day, the antiquity of your vocation! and you, ye exclusive elegants of Almack's, ye dandy habitues of Brookes's, who canvass the official dignities of the Irish Viceregal household with "all appliances and means to boot," behold in the "honest, careful, and diligent person," who "kept the roulmes and walkes of the castel clane," and wound up the clock into the bargain for sixteen pence a day current money, behold the origin and type of your controllerships, your stewardships, and your chamberlainships, and of all those splittings and splicings of an homely office, which once included all your several services! (10)

(To be Concluded next week.)

(8) The state of the neighbourhood of the capital in the latter end of the 16th century, is curiously depicted by an item in the laws, viz.: "That the deputy be eight days in every summer cutting passes of the woods next adjoining the King's subjects, which shall be thought most needful." A "newe ditche" was then an improvement, which brought some MacAdam of the age emolument and promotion; and the boldly cut "passes" of Powerscourt, Strenanlora- Branwallehangry, and others in the vicinage of the pale, were then deemed as important, and now sound as classical in the ears of the true Irish antiquary, as that of Thermopylæ. "Och ye've sould the pass," is an ancient Irish figure of speech applied to some real or supposed traitor to "th' ould cause."

(9) "The seyd Sir Richard landed at Malahide, and there a gentlewoman called Talbot, receaved hym, and made him right good cheer; (a) and the same day at afternoon, the Bushopp of Meath, John Streete, and others, came to Malahide aforesaid, well accompanied, and fetched the seyd Sir Richard to Dublyn, and at his coming thither the mayor and substance of the city receaved hym at the Black fryars gate, at which Black fryars the seyd Sir Richard was lodged."—Sir Richard Edgcomb's Voyage to Ireland, 1788. The Black fryars was a Dominican abbey, near the old bridge, where King's Inn now stands.

"The seyd Sir Richard, at the desire of the seyd Erle, went to the monastery of St. Thomas the martyr, where the lordes and council were assembled, and ther in a great chambir, callid the King's chambir, the seyd Sir Richard took hommage, first of the seyd Erle, and after that of othir lordes, whose names be written hereafter in the boke; and this done, the seyd Erle went into a chambir, wher the seyd Sir Richard's chaplain was at masse, and in the masse time, the seyd Erle was shriven and assoiled from the excommunication that he stood in by the virtue of the Pope's Bull, and befor the Agnus of the seyd masse, the host divided into thre partes, the priest turned him from the altar, holding the seyd thre partes of the host upon the pattege, and ther in the presense of many persons, the seyd Erle, holding his right hand over the holy host, made his holy oath of ligeance unto our soverain Lord Kyng Henry 7th in souch form as was afor devised; and in like wise the Bushopps and Lordes, as appeareth hereafter, made like oaths; and that done, and the masse endid, the seyd Erle, with the seyd Sir Richard, Bushops and Lordes, went into the church of the seyd monastry, and in the choir thereof the Archbushop of Dublin began Te Deum, and the choir with the organs sung it up, solemnly, and that tyme all the bells in the church rang. This done the Erle and most part of the seyd lordes went with the seyd Sir Richard into his lodging and dined with hym, and had right good cheer; and the seyd Sir Richard at their making of the seyd Erle's hommage put a collar of the King's livery about the seyd Erle's neck, whych he wore throughout the seyd citty of Dublin, both outward and homeward."

It is worthy to observe, that the descendants of the gentlemen who had large estates in the county of Dublin at this period, and who came into Dublin to do homages to the "King's deputy" in the fifteenth century, are in the actual possession of those estates at the present day; for instance, "Item—Peter Talbot Knight, Lord of Malahide, at the monastery of our Lady St. Mary, Develin (Dublin), made both his hommage and fealty."

"The same day, William St. Lawrence of Houth, fecit fidelitatem: Item, Barnabas Barnwell."

"Item, Sir J. Plunket, Lord of Dunsany, and Christopher Bellew, of Bellewstown, &c., &c., &c.

(a) The room where "Sir Richard" received his "good den" from the hospitable Lady of Malahide, stands at this day in high preservation. Its lofty and impregnable walls, its fine rafted roof of black Irish oak, still enshrine the same spirit of hospitality that distinguished their noble masters in the 14th century.

"Item, Christopher Barnewell, Lord of Tremlestown." The professed Irish antiquaries will call these families interlopers, new settlers, and "boddie sassoni," English churls; and there is no disputing that their tenures are not above six hundred years old.

(10) It is but fair to say that this remark is the pure abstraction of patriotism; for however multiplicity of official places may deserve to be cried down upon a general principle, the private society of Dublin stands largely indebted to the English gentlemen who fill them, for the educated minds and polished manners they contribute to the social weal.

SALTZBURG.

BY J. R.

On Salza's quiet tide the westering sun
Gleams mildly; and the lengthening shadows dun,
Chequered with ruddy streaks from spire and roof,
Begin to weave fair twilight's mystic woof,
Till the dim tissue, like a gorgeous veil,
Wraps the proud city, in her beauty pale.
A minute since, and in the rosy light
Dome, casement, spire, were glowing warm and bright;
A minute since, St. Rupert's stately shrine,
Rich with the spoils of many a Hartzwald mine, *
Flung back the golden glow: now, broad and vast,
The shadows from yon ancient fortress cast,
Like the dark grasp of some barbaric power,
Their leaden empire stretch o'er roof and tower.

Sweet is the twilight hour by Salza's strand,
Though no Arcadian visions grace the land:
Wakes not a sound that floats not sweetly by,
While day's last beams upon the landscape die;
Low chants the fisher where the waters pour,
And murmuring voices melt along the shore;
The plash of waves comes softly from the side
Of passing barge slow gliding o'er the tide;
And there are sounds from city, field, and hill,
Shore, forest, flood; yet mellow all and still.

But change we now the scene, ere night descend,
And through St. Rupert's massive portal wend.
Full many a shrine, bedeckt with sculpture quaint
Of steel-clad knight and legendary saint:
Full many an altar, where the incense-cloud
Rose with the pealing anthem, deep and loud;
And pavements worn before each marble fane
By knees devout—(ah! bent not all in vain!)
There greet the gaze; with statues, richly wrought,
And noble paintings, from Ausonia brought,—
Planned by those master minds whose memory stands
The grace, the glory, of their native lands.
As the hard granite, 'midst some softer stone,
Starts from the mass, unbuttressed and alone,
And proudly rears its iron strength for aye,
While crumbling crags around it melt away;
So, midst the ruins of long eras gone,
Creative Genius holds his silent throne,—
While lesser lights grow dim,—august, sublime,
Gigantic looming o'er the gulfs of Time!

HUDSON RIVER MASTODONS.

The remains of another mastodon were found recently by labourers digging muck and marl from a small swamp near Newburgh, Orange County, New York. This part of the Hudson River valley, on the west shore, just north of the Highlands, appears to have been a favourite habitat of those gigantic animals, for three skeletons of mastodons have been unearthed in former years from the swamps of Orange County. The latest find differs from the others in that the bones, instead of lying close together at the spot where the monster had become enmired, were found scattered over about 1,000 square feet, at depths varying from two to eight feet

* The dome of the Cathedral of St. Hubert is covered with copper; and there are many altars an shrines in the interior constructed of different sorts of marble, brought from quarries in the vicinity. St. Hubert, to whom the Cathedral is dedicated, was descended from the dukes of Ireland, and was baptised by St. Patrick.

A FRENCH WRITER ON EARLY IRISH LITERATURE.

Abridged by "Lector" from J. Darmesteter's "English Studies," as translated by his widow. London: Unwin, 1896.

France, the land of Gaul, was the natural cradle of Celtic studies; but they died young, destroyed by the absurdity of the Celto-maniacs, with whom it was an article of faith that Primitive Man conversed in Bas-Breton. The public englobed in the same lisdain the Celto-maniacs and Celtic studies, with the result that when the creation of comparative philology renewed linguistic studies, the reconstitution of Celtic research took place, not in France, but in Germany. The Bavarian Zeuss taught the descendants of the ancient Celts the lesson of their origin. The "Grammatica Celtica" of Zeuss appeared in 1853, but was little read in France, where Celtic studies began none the less to revive, but only in the direction of archæology. There were many to collect and study the monuments, the coins and the inscriptions of Gaulish and Gaulo-Roman times. Others edited the ancient texts which bore on our national antiquities. M. de la Villemarque was the first to turn his attention towards manuscripts. If he had so chosen, he might have laid a wide and firm foundation for Celtic science in France; but he did not choose. It is only fifteen (now twenty-five) years since Celtic history and philology have made any definite advance in France; and this progress is almost entirely owing to M Gaidez and M d'Arbois de Jubainville. Founded by M. Gaidoz in 1870, the "Revue Celtique' soon became an international authority—a trysting place for the Celtic scholars of Europe. A little later he inaugurated at the Ecoledes Hautes Etudes the first course of lectures on the subject ever heard in France; and thanks to the initiative of M. Henri Martin, these studies, national above all others, entered with M. d'Arbois de Jubainville into the programme of the College de France. By his severe and trenchant criticism, pitiless to all hypothesis, and his creating the "Revue Celtique," M. Gaidoz has especially contributed to Celtic science; whilst on the other hand M. d'Arbois has chiefly merited by his original research in regions hitherto unexplored, and by the mass of fresh information which he has placed at the disposal of the public. The two first years of his professorship were fruitful in two considerable works, as interesting by the novelty of their facts as by the originality of their conclusions. With their aid I hope to give some idea of the Celtic question.

Few people have wandered more about the world than the Celts. Colonisation was their speciality. Natives of Asia, as we may suppose, like the other Aryans of Europe, they populated Gaul and Britain, Spain, Northern Italy, and Southern Germany, settled north of the Danube, and went as far afield as the great plains of Asia Minor. They terrorised Europe and threatened Rome, only to recoil before the advancing fortunes of the Roman armies. Rome subdued them to its own colour, but they were not, however, assimilated by Rome; so that the earlier civilisation of the Celts remained always recognisable in certain shreds and patches in Ireland especially, and in Wales, Cornwall, and the North of Scotland. In our times the Celtic idiom, formerly spoken from Ireland to the Black Sea, is the tongue of scarce three millions of men, scattered through the countries just cited, and along the Breton march of France, whither in the early Middle Ages, the English Bretons fleeing before the Saxon invaders, brought their language and their civilisation.

The Celtic dialects still extant are divided into two families, the Breton, to which Wales and Brittany belong; and the Gaelic, of Ireland and the Scottish Highlands. This division, imposed by philology, is confirmed by history, as the Bretons of France came from Wales, the Celts of the Highlands from Ireland; in other words, the two principal forms of speech scattered at present athwart the last Celtic fastnesses are derived from two old forms—that of Ireland, and that of Great Britain. Too little remains of the ancient tongue of Gaul for science to decide upon its origin; and in all probability it was third deviation, nearer to Welsh and Breton than to the Gaelic dialect.

As a rule in studying a family of languages the philologist attaches especial importance to the oldest, that whose texts and inscriptions date farthest back in history. Rightly learned, this tongue will help us to interpret the others, for it is probable that it has preserved the primitive forms, altered or worn into insignificance in the kindred branches. It is this which gives especial value to Sanscrit. The inscriptions of Gaul—were they but more numerous—would stand for the Sanscrit of Celtic tongues. They date from the first century, and even further back. In them the Celtic language is intact, and pure as Greek. But, alas! they are as rare as they are priceless; and Gaul being almost mute, Ireland must be the spokeswoman.

In studying the texts of Ireland for the purposes of science the Celtic scholars of our time rediscovered a fact almost forgotten, namely, that Ireland in her day possessed a literature as rich and cultivated as that of any civilised people—that in her hour of glory she was the light of Christendom—girt with her cohort of bards and her wealth of epics, at a moment when everywhere else in Europe art and letters appeared to droop and fade. These poems, almost entirely unpublished, remain in their thousands on the shelves of the great libraries of Ireland. The mere catalogue of manuscripts relating to epic poetry fills a whole volume recently published by M. d'Arbois de Jubainville, without exhausting the material. This literature interests us in its more ancient parts especially, because they show us most clearly the life and manners of the ancient Celts.

The period of invention, the true creative ferment ceases with the seventh century of our era, when the triumph of Christianity was assured in Ireland. Then began a second period of collecting, editing, and systematising the epic wealth of the preceding centuries. The monks who undertook this pious labour naturally baptised their antique heroes; but their thin veil of piety is perfectly transparent—the rugged features of a primitive age appear behind it. The Christian editors were not too exacting. The Irish clergy showed themselves ever clement to popular tradition, and their tolerance was rewarded. Their religion was accepted as not incompatible with the beloved ancient stories, which had charmed the vigils of generations in every hut or castle. Thus by its welcome to the national epic, Irish Catholicism ingratiated itself yet further in the favour, in the heart of a people whose sensitive imagination it had never ruffled. The epic poem, with its myths, its heroes, and its legends, thus survived the early faith of Ireland. The hymns of the Church did not drown the ancient harp in Tara's halls; the stories of the Gods, sons of Dana, of Conchobar, and Ossian, continued to ring along highways and byways, round the peasant's hearth, and in the great halls of the royal duns.

It would be interesting to know the history of the society which produced such literature; we can but guess at it from the witness of the pages that survive it. Real historical documents we have none until the beginning of the decadence—a decadence so glorious that we might almost mistake it for a Renaissance—a growth less original, certainly, but scarcely less wonderful, if we consider the condition of Continental Europe at that date.

For the classic tradition, to all appearances dead in Europe, burst out in fresh flower in the Isle of Saints; and the renaissance began in Ireland 700 years before it was known in Italy. During three countries Ireland was the asylum of the higher learning which took sanctuary there from the uncultured States of Europe. Alas! all this brilliant delicate efflorescence was foredoomed to perish. Soon the invasion of Danes and Saxons, the raids of pirates and barbarians destroyed all before them. Learned Ireland perished or crossed the sea to Gaul. Yet even the barbarians who stamped out this miraculous civilisation in Ireland soon became its pupils in Ireland. Mr. Sophies Bugge, a valiant Scandinavian, who was not afraid to speak the truth, amid a perfect tempest of patriotic clamour, has recently shown us that the poets of the Edda are the disciples of the Irish File. They copied from the monks and minstrels of Erin even their peculiar metres, and from the fragments of quainty assorted mythology and Bible history, which they picked up around the firesides of the castles and convents of Ireland, they constructed with barbaric ingenuity a religion of their own, and a National Valhalla.

A people which lives against the background of such a past cannot appear entirely destitute of nobility, however forlorn or even servile may be the present. 'Tis with the glory of the past that a downtrodden nation finds means to build itself a future. Homer and the gods of Olympus inspired the revival of Greece. Her scholars and students are responsible for a united Germany, and the same impulse is at work in Hungary to-day. But, unfortunately, in the scientific reconstitution of early Irish literature and history the artisans are German, English, and French, with few exceptions. There will not be a united Ireland until there be an Irish philology.

Years must pass ere it will be possible to draw up so much as a catalogue of Irish letters in their several branches of poetry, jurisprudence, history, and theology. Of our crown of jewels in this abundant treasure, viz., the Irish epics, I hope to show the interest which they offer, not only to lovers of poetry, but to students of the history of literature. The Irish epics comprehend three great cycles, the Mythic, the Heroic, and the Legendary. The mythic cycle has for its object the origin in history of the gods, of man, and of the world. The Heroic cycle clusters round the adventures of Conchobar and Cuchullin. 'Tis a subject born of the fusion of ancient myths with historical traditions; and it treats of the struggle which Ulster in the North maintained against the rest of Ireland. Tradition places the adventures of the two heroes somewhere in the first ages of the Christian era. The Heroic epic gives us a faithful picture of Irish manners and customs prior to the conversion of the Isle of Saints. The third cycle, the Legendary, celebrates the historical events of the second and third centuries after Christ, and sings of the chivalry of Ireland and of the exploits of Finn (MacPherson's Fingal) and his Fenians, whose name, at least, modern Ireland has resuscitated.

The fragments of the mythic cycle are too rare—too insufficiently edited—for us to gather a clear idea of the religion of the ancient Irish. Still, we perceive that it was germane to the other Arvan mythologies, and composed of much the same naturalistic elements and ritual. In Ireland, as elsewhere, the war of light and darkness is the centre on which the life of the universe depends; as elsewhere, the mystic powers of worship maintain the stars in their courses, and are even stronger than the gods to whom they are addressed. As in India the world was created by a God-made priest, by means of a burnt offering; so in Ireland the heaven, the earth, the sea, and the stars are the work of three Druids older than any god.

All cosmology tends towards history. Myths, infinite in form, identical in essence, sooner or later group themselves in successive series. When a poet of genius, or even merely fortunate in his choice, takes up the vague material in his inspired hands, turns it, and forms it, and makes it into shape, his production imposes himself upon posterity, and he bequeaths a chronology to future historians. The Irish poets fix, more or less approximately the order of their mythic dynasties; races, human and divine, succeed each other on the green soil of Erin—succeed, or it may be jostle, each other—innocent and astonished neighbours. Thus they sing the destinies of Ireland, from the first Colonist, Partholon or Nemedh, until the last comers, the Picts and Scots—finding place between them for the human tribe of the Firbolgs, the demon tribe of Formore, the divine children of Dana, and the Milesians, who sailed thither from the realms of death.

With the historic period begin the two heroic and legendary cycles of Conchobar and Ossian—less unknown to Europe than the reader may suppose—since it was they who furnished forth the elements of those "Poems of Ossian," which some hundred and odd years ago lit up such a flame in the enkindled imagination of our ancestors. The semi-forgeries of MacPherson (the author of these poems) are now clear in all their details: they are the combination of two independent epic cycles, welded together against nature, transformed to suit the adaptor's pleasure, without heed to the veracity of his presentation—prettified and airified to suit 18th century tastes and aspirations, then weary in truth of a classic convention, and in quest of a newer convention, which it dubbed "Nature." So that the rude, ferocious, half-barbaric heroes of Ireland appear as generous Paladins worthy of Tasso, with the delicate point of honour and the chivalry of a knight errant. The Irish legend in its tragic

beauty, with its grandeur of superstition, and its vivid bursts of passion—all these details disappear in the rendering of MacPherson. The literature of Ireland is the key of the Celtic world; but it is not the whole of Celtic literature. Brittany contributes her share to the treasure; but it is less ancient and still comparatively unexplored. The Breton cycle is dominated by the grand figure of King Arthur, who passed from Wales into Brittany, and thence into France, whither all Europe has come to do him homage and sit among his knights at the Feasts of the Round Table.

Gaul, no less, we may suppose, had its own early letters, now lost beyond recovery. All we can do for Gaul is to illuminate the scanty fragments which remain of her perished culture by the borrowed lights of Ireland.

I will quote one example of such unexpected revelations. The cities of Gaul had made up a purse to raise at Lyons a temple to the divinity of Cæsar Augustus. On the 1st of August a festival was held there, with annual games. This yearly feast, it may be imagined, was given on the 1st of August in homage to Augustus, but Irish poetry teaches us that the 1st of August was one of the three great National holidays held in honour of a divinity named Lugu. Now Lyons, in Latin, "Lugdunum," or more anciently "Lugu-Dunum," signifies the "Fortress of Lugu." It is, therefore, probable that the 1st of August had long been celebrated in honour of Lugu, and had been the National festival of Lyons for many generations before the Gallo-Romans transferred their homage to the Emperor Augustus. In Ireland, at the annual feast of Lugu, the File or Bards used to recite their poems, old and new, so that Caligula's Rhetors at Lyons were but the continuation of these File.

Ireland has not yet given up to us in her texts and monuments any memorial of the Gaulish gods quoted in classic antiquity. Yet one of them, the Hercules Ogmios of Lucian, the God of Eloquence, is admitted to be the Irish Ogme, the inventor of the Ogam writing.

In an hour when national antiquities meet with more attention in France than has ever been paid to them before, it is but just that the most considerable and the most enduring of the constituents of the French character should receive its due; but Gaul has disappeared from the surface of the Gallic soil, although abundantly treasured beneath it. To rediscover Gaul let us cross the Channel to Ireland. This is the reason why Irish archaeology and Irish philology should become a branch of the study of our national antiquities. Ireland alone remembers a portion of our forgotten past.

THE YUCATAN TOE.

The toes of civilised people have lost much of their cunning as helpful members of the body in any work that requires skill. The Maya people of Yucatan, however, have kept the free-and-easy use of the toes in doing many kinds of work. It is said that the Maya women, who always go barefooted, will pick up a pin from the floor as easily with their toes as with their fingers. An archeologist who has spent some time among that people in the interest of the Peabody Museum, of Harvard University, tells the following anecdote of his landlady at Chichen Itza:—

Coming into the house one day, the American noticed that the pig had been rash enough to trespass upon the domain of the mistress of the house. The woman was in close pursuit of the intruder, but piggy would look in any direction other than towards the door.

Had she been compelled to stoop and seize the animal with her hand, the outcome of the chase might have been doubtful. Mayan training, however, gave her a great advantage. She reached out her foot as the pig ran by, seized him by the tail between her great toe and the second toe, and with a graceful swing of the leg she landed the pig some yards beyond the threshold.

When told by the American that he had never seen the thing done in his own country, the Mayan woman replied that it was as easily done with the toes as with the fingers.

OUR WEEKLY STORY

A WINDMILL WHICH WOULD NOT TURN.

(FROM THE FRENCH.)

Maitre Humeau's windmill turned so quickly and so well, both day and night, and in all kinds of weather, that everybody marvelled at it: and what everybody marvelled at, too, was that the miller was rapidly growing rich.

The mill stood high up on top of a hill, firmly set, the foundation being of stone work from whence rose up the timber work. . . Oh, the beautiful wood work, my dear children! He who had made it in the good old times must have been a splendid workman. It commenced by a single pivot, whence jutted out more than thirty curved beams, supporting the cage, the wings, the roof, and the miller who was not to be seen.

For more than a hundred yards round about all the trees had been cut down, and as the country was flat, very extensive and very open, the windmill could be seen from everywhere around. The slightest breeze which rose encountered it. A storm made it go mad. In winter time, when the biting north wind was blowing, the miller drew in his sails and left but those frames of chestnut wood, which were quite sufficient to turn the mill, and very prettily, I can assure you.

When not asleep, Maitre Humeau watched the donkeys coming up to his mill from his window, and counted the farms; or oftener, when money was due to him, and provided the crops were ripening well. he rejoiced within himself at the thought that other people's success would bring him more profits.

"One sack of wheat, two sacks of flour," was his motto and measure.

In a few years he earned money enough to become the greatest personage in the country. All through the week he was a miller white from head to foot; but on Sundays one would have taken him for a real lord, for he wore such fine clothes, and his countenance was so fresh, and he appeared most contented with life.

Everybody would greet him "Maitre Humeau!"

"Well, my good man," would reply the worthy miller.

Yet no one envied his luck. He was an honest man.

Unfortunately, however, as he grew old he also grew a little avaricious. Riches hardened his heart, and he began to show himself more and more exacting towards those debtors who were not paying up well. Furthermore, he proved himself less condescending to the poor who possessed neither horses nor carts, mules nor donkeys, and who carried all their wheat to the mill in a bag.

One fine day, when a fresh breeze had sprung up over the fields, now fair with stubble, and had made the four wings of the mill turn with fury, the miller and his daughter stood talking over the future with their arms folded on the window sill. As is always the case, they imagined it as being more beautiful than the present.

The girl was pretty, and more like a lady than a miller's daughter; though not of a wicked disposition, she had a habit—the fault of her parents, who had spoiled her—of judging everyone from the height of their windmill that is, a little too high.

"Jeanette!" said the father, "business is going on well."

"So much the better for you——"

"So much the better for you also, Jeanette, for in two years—or I'm not Maitre Humeau—your marriage portion will be put aside, the windmill will be sold, and I think all the middle-class gentlemen of the town, even the richest of them, will be disputing the honour of becoming the son-in-law of a man having an income as I."

The daughter smiled.

"Yes! I was right," continued he, "in sending away those small customers, who, with their own sack, give as much trouble as my best customers, and don't bring any profit after all. I don't want the custom of the needy, and I'm not dependent upon it. Let them go elsewhere! That's the way, isn't it, my dear little girl?"

The young girl extended her arm towards a hollow road, an old route now almost deserted and quite covered with willows, which opened out at the foot of the hillock on which the mill was built, and descended to the very depths of the valley, and, there meeting a stream, followed it, twisting and turning itself like a large green ridge, till all traces of it were lost in the extreme distance.

But in the harvest time carts laden with hay, wheat, or oats began to wend their way along this road again, and all throughout the year, though in smaller numbers, came the inhabitants of the few and far between farm houses which lay lost in the humid portion of the plain.

Jeanette showed him then a point of this old road, and remarked:

"Look! here comes at this very moment Widow Guenfol! She has her son with her. What on earth are they carrying on their backs? Some sacks of corn, if my eye don't deceive me! She's a good customer is this Widow Guenfol!"

Then she burst out laughing so prettily that the windmill, which would turn for even less than that, began to spin round quicker and quicker.

"A miserable gleaner and a beggarly woman!" growled Maitre Humeau. "You'll just see how I'll receive her!"

He remained there leaning with his elbows on the window ledge, and put forward his head a little as the woman painfully began to climb the steep ascent.

Widow Guenfol was quite bent under the weight of a sack three-quarters full which she was carrying on her back and held firm over her left shoulder with her two hands. She stopped three times before reaching the summit of the hill. And when at last she had thrown down her sack near to the door of the mill, she sighed with fatigue and pleasure.

"Ah!" she said, looking at her little son, a curly headed fellow of five summers, "we are at last at the end of our toilsome journey, Jean du Guenfol!"

Then she raised her head.

"Good day! Maitre Humeau and company. Look at this beautiful wheat I've brought you. There's not much of it, but it's of good sort, I think."

"You can take it back," growled the miller; "my mill doesn't turn any longer for your four bushels of wheat. It requires bigger mouthfuls."

"But you did it for me last year!"

"Yes, I know; but I'm not doing it any more. You understand?"

It was so well understood that the widow had already begun to weep, regarding her sack of corn and the small bag of little Jean standing by her side, like a grey hen and her little chick.

Carry them back! Could it be possible? Surely the miller was not so cruel—he was certainly joking.

Then making off as though to return, she said aloud:

"Come, Jean du Guenfol! Maitre Humeau will take your sack and mine, and will give us back our white flour."

She took her son by the hand: he was looking up in the air in the direction of the skylight of the mill, and said:

"No, he will not; wicked miller, he will not."

Scarcely, however, had she descended halfway down the mound when the man, now quite angry, appeared in the doorway, and, opening the sack, dug his hands deep down and drew them forth full of corn, which he threw after these poor people.

"There's your corn for you! Look at it! Come back and take it if you don't wish it all to go after you in the same way. Beggars that you are, and bad payers in the bargain!"

Thus the corn of the gleaning passed out of his heavy hands; it rolled upon the skylights; it rained down upon the mother and son, and such was the miller's strength that a whole handful flew right up to the top of the mill, and fell like hail upon the roof.

A cracking noise was heard, and the wings came to sudden standstill. But the miller paid no heed to it, for he had already gone up the inner ladder, whilst the widow, quite desolate, took her half empty sack up again and went off.

The beautiful Jeanette was laughing at the window.

A grey petticoat and a black vest soon became invisible in a verdant country.

Then they stopped laughing, and soon noticed that the mill was no longer turning. The wings were fidgety and trembling from end to end; they were bent a little as if impatient to start off again, but the pivot resisted the wind. The machines had now stopped.

"I'll go and give out a bit of sail," said the worthy miller; "the wind has dropped a little."

And then with a turn of a crank he unfurled all the sail he usually let out on days when the wind was languishing lazily in the calm heavens.

The timber work shook from corner to corner, the walls of the mill trembled, and one of the wings broke with a terrible crash under the violent pressure of air.

"Cursed beggars! this is what we get for listening to them. There must have been a sudden change in the wind whilst I was engaged in sending them away."

The following day workmen were sent to repair the broken mill.

He paid them up, spread out once more his sails in the usual style, and listened from the inside of his little nook, near to his motionless mill stones, awaiting that peculiar rolling noise from above, that shriek of the wood which every morning betokened that the wings had begun to turn.

But he was obliged to draw in his sails very quickly for fear of another accident. The long beams bent like hoops, and nothing turned round.

"These village workmen are ignorant asses —mere bunglers!" retorted the miller. "I'll get some others from the town, and then we'll see."

Then came the workmen from the town, who took off the roof, replaced the four wings, put him to very great expense, and yet did not succeed any better than the others.

When they tried to set the new machinery in motion the wind could not move them. It blew in to the cross pieces, spread out the sail, bent it even, but that was all.

The customers, however, went away. Maitre Humeau began to have law-suits on account of contracts which he had made and could not fulfil. Jeanette's marriage portion did not increase; on the contrary, it was daily growing less.

The miller and his daughter began to weep.

"I can't understand anything of this affair which has just happened," simpered Jeanette; "but I think that the family Guenfol are somehow the cause of it. We have offended them, and perhaps they can discover the reason why our mill won't turn."

"If it only needs a nice present to take away this curse and misfortune which is hanging over us," answered the miller, "I'm not against giving it."

"Go, then, and be very kind, father, for our fortune depends upon these poor people, perhaps," suggested the daughter.

Maitre Humeau always obeyed his daughter, even when she was wrong. And in this circumstance he did well to heed her words.

Along the roads, so green that they seemed almost black, he wended his way by the side of the brook to Guenfol's cottages. As he advanced towards the level of the plain the air became more and more humid; frogs leaped about on the moss in the deserted roadway; the perfume of many plants filled the air; reed appeared everywhere and encroached upon the pathway.

Accustomed to the heights of his mill, the miller breathed this air with difficulty, and felt himself so much the more inclined to pity.

Beneath the branches at some paces from the stream he perceived the house of the Guenfols all covered with mouldiness; grass and wild herbs lay at the base of the building, the same were hanging from the roof; it looked like a shaggy head dress which the wind entangled and disentangled at will. One could not enter the house without stooping.

Maitre Humeau did not go in, for he discovered at the same time a very narrow field which ascended a gentle rising, a field which resembled a flower bed. Here a young boy was working. Jean du Guenfol had thrown his jacket upon the slope, and was digging away with all his might in a small border of earth.

Around him were to be seen so many flowerless stalks of poppy, mint, and lavender especially—the number of these was even greater than that of the stubble stalks.

"So here's the miserable bushelful of earth from which they make their living," thought Maitre Humeau, "and it's the little one that's working it up."

"Halloa there, Jean du Guenfol!" shouted the miller.

The little fellow turned round, recognised Maitre Humeau, and blushed. He did not even leave the furrow in which he was working. But since he had the habit of speaking honestly to everybody, he asked—

"What do you want, Maitre Humeau?"

"Since the day you and your mother came to my windmill has never once turned round, my little friend."

"But I can do nothing for it."

"Perhaps you can, perhaps you can't. But my daughter Jeanette has got it into her head that my mill, which stopped at seeing your backs, will begin to go again at seeing your faces."

"My mother is now dead of misery," responded Jean du Guenfol. "I have been left alone for fifteen days to sow our field, for my grandmother is very old. Leave me alone, Maitre Humeau; I've no time to follow you."

He had lifted up his spade and struck the earth, which fell down in lumpy clods. The poppies fell, the mint crumbled into dust, and the lavender broke into blue threads.

"You are doing nothing but burying bad seeds in your field," continued the miller. "Listen to me. If you will accompany me, and if you discover what is wrong there, I will give you five sacks of flour, enough to feed you for all the winter."

"I've got no time."

"But you can have your choice of ten sacks straight from the mill."

"Maitre Humeau, I'm not a workman experienced in the windmills, and I don't know what is the matter with your wings."

"Jean du Guenfol, I will build you a new house at the bottom of my hillock for you and your grandmother, and I will give you one of my fields three times larger than yours."

The little fellow let his spade fall and followed the man.

When they stood before the mill the wings did not turn at the mere sight of the boy's face, as Jeanette had thought, but the little fellow went up the ladder with the miller, his daughter behind him, who having no longer any other hope, besought him one after the other.

"Look well, Jean du Guenfol! unbewitch our mill. Look at it well; look at everything!"

The little fellow searched in every corner, for he took great pleasure in visiting the windmill. He wished to climb right up to the pivot, so the miller stopped, saying:

"Get upon my shoulder, my little friend; on my head if you like, you are not heavy! Do you see anything near the pivot?"

"I see nothing," replied Jean; "but I smell our corn."

At this word Maitre Humeau was so agitated that he nearly fell backwards. He supported himself against the wooden walls of the mill, and said:

"Jean du Guenfol, I promise you again——"

The child had already put his hand into the opening in which the beam of the pivot used to turn so well. As he had a fine hand, he felt the edges of the fent, recognised the grain of the wheat by his very touch, and drew it ouf. . . . At once the four wings impelled by the autumn wind turned rapidly round, making the whole wooden mill sing.

Since then, night and day, the windmill never stops more.

It is for that reason that now a new house is to be seen upon the hillock with a field which yields an abundance of corn and which has no other shade in summer but the wings of the windmill.

SONG OF THE FAIRY CAPTIVE.

BY ROBERT DWYER JOYCE.

Stars are brightening
Over the hill;
Clouds are whitening—
Still, oh! still,
Ever and ever my doom shall be
To go with the fairy companie,
Over the moorland and over lea,
'Till my true love, Dermid, come for me!

Oh! There is singing
By wood and glen;
Bugles are ringing
O'er rock and fen:
Not an owl dare scream or hoot—
All the voices of night are mute,
While the dancing lasts to the harp and flute,
Down by the oak tree's mossy root.

Oh! it is weary
The long night-time,
Darksome and dreary,
'Till matin chime,
Down o'er the lonely streams to sail,
Ever away in the moonlight pale;
Thus to dance in some trackless vale,
With none to list to my ceaseless wail!

Oh! I am sighing
To meet and find
Voices replying
Of human kind—
Sighing some friendly face to see,
Sighing for Dermid to come to me;
In the strength of his love to set me free
From the wiles of the fairy companie!

PEAT AS A SUBSTITUTE FOR COAL.

The consequences of the recent coal strike have directed attention to the manufacture of peat briquettes in Canada as possibly indicating a substitute for anthracite as fuel. United States Consul Gunsaulus, at Toronto, reports that improved methods have resulted in the manufacture of blocks of peat of such density and quality that they serve very well in the place of coal. The maximum manufacturing cost is 1.50 dols. per ton. The Canadian experiments in this industry have continued for several years, but the best results have been attained within the past few months.

ANCIENT DIGNITY OF IRELAND.

The following history, which we take from the Appendix to the General Council of Constance l'Abbe and Cossart Concilia, vol. xii., col. 1727, et seq., Ed. Paris, 1672), will be interesting to Irishmen, as showing the respect which was paid to the ancient dignity of Ireland.

We must explain that there was an ancient custom in these countries of voting by "Nations," as it was called. Four "Nations" were acknowledged—viz., France, Spain, Germany, and Italy. These "Nations" were not "Kingdoms." Each was a collection of several independent kingdoms. We have the lists, and we find that each "Nation" comprised six or eight Kingdoms, whose Governments were independent of each other.

At the Council of Constance, which was held A.D. 1414, the King of England claimed that the English should be acknowledged as a separate "Nation," having a vote of their own in the Council. The King of France was very jealous at this, and ordered his ambassadors to protest against it in the Council; their protest is given in the Appendix of the Council to which we have referred. The Ambassadors of France insist that England had always been reckoned part of the German "Nation" in all general Councils, and they maintain that it ought to be so still, for as England had only twenty-five Bishops, it was absurd that so few should have a separate vote in the Council.

The Ambassadors of the English King were heard in reply, and they do not deny either of the above statements; but they say, in answer to the fewness of their Bishops, that the Irish, who had sixty dioceses, were united with them in the "Anglican Nation," and taking in the Welsh and some Scotch Bishops, who joined with them, there were 110 Bishops altogether. And in answer to the statement that England had always been counted part of the German nation, and not a nation in itself, they do not deny it; on the contrary, they seem to admit that this was true; but then they quote St. Albert the Great and Bartholomoeus as follows:—"That the whole world being divided into three parts—viz., Asia, Africa, and Europe, Europe is divided into four kingdoms—first, the Roman; secondly, the Constantinopolitan; third, the kingdom of Ireland, which is now translated to the English; and fourth, the kingdom of Spain. From which it appears that the King of England and his kingdom are of the most eminent and the most ancient kings and kingdoms of all Europe, which prerogative the kingdom of France cannot obtain."

Such was the defence of the Ambassadors of England. They did not rest their claim upon the rights of England itself, but on her inheriting the ancient rights of Ireland; and thus England, obtained dignity in Europe and influence in Christendom by her union with Ireland. For this defence having been heard by the Council of Constance, they decided that England and Ireland united should rank and vote as a separate nation, thus giving them an influence in the Council which the King of France sought to prevent, and which would have been wholly lost if England had stood alone. We observe, as an appropriate acknowledgment of their obligation to Ireland, that ths "Anglican nation" was throughout represented at that Council by Patrick, Bishop of Cork.

The rank assigned to Ireland among the Kingdoms of Europe, in the above extract, may not appear so absurd if we reflect that all the other kingdoms of modern Europe, which have any antiquity, arose out of the ruins of the Roman Empire, and can trace their origin no farther back than its decay; while Ireland, which had never been conquered by the Romans, could show the succession of her kingdom for ages before. This was, no doubt, the reason of the precedence assigned to her by St. Albert and Bartholmoeus.

In the preface to Lynch's Feudal Dignitaries, it is stated (p. 8) that the French rolls in the Tower contain enrolments of the proceedings on behalf of England at the Council of Constance.

ST. BRANDAN.*

BY MATTHEW ARNOLD.

St. Brandan sails the northern main,
The brotherhoods of Saints are glad;
He greets them once—he sails again—
So late! such storms! The Saint is mad!

He heard, across the howling seas,
Chime convent bells on wintry nights;
He saw, on spray-swept Hebrides,
Twinkle the monastery lights.

But north, still north, Saint Brandan steer'd—
And now no bells, no convents more;
The hurtling Polar lights are near'd,
The sea without a human shore.

At last—(it was the Christmas night,
Stars shone after a day of storm)—
He sees float past an iceberg white,
And on it—Christ!—a living form.

That furtive mien, that scowling eye,
Of hair that red and tufted fell—
It is—oh! where shall Brandan fly?—
The traitor, Judas, out of hell!

Palsied with terror Brandan sat,
The moon was bright, the iceberg near;
He hears a voice sigh humbly, "Wait!
By high permission I am here.

"One moment, wait, thou holy man!
On earth my crime, my death, they knew,
My name is under all men's ban—
Ah, tell them of my respite, too!

"Tell them one blessed Christmas night—
(It was the first after I came;
Breathing self-murder, frenzy, spite,
To rue my guilt in endless flame)—

"I felt, as I in torment lay
'Mid the souls plagued by heavenly power,
An angel touch mine arm, and say:
'Go hence, and cool thyself an hour!'

"'Ah, whence this mercy, Lord?' I said,
The leper recollect, said he,
Who asked the passers-by for aid
In Joppa, and thy charity.

"Then I remembered how I went,
In Joppa, through the public street,
One morn when the sirocco spent
Its storms of dust with burning heat;

"And in the street a leper sat,
Shivering with fever, naked, old;
Sand raked his sores from heel to pate,
The hot wind fever'd him five-fold.

"He gazed upon me as I pass'd,
and murmur'd: 'Help me, or I die!'
To the poor wretch my cloak I cast,
Saw him look eased, and hurried by.

"Oh, Brandan, think what grace divine,
What blessing must full goodness shower,
When fragment of it small, like mine,
Hath such inestimable power!

"Well-fed, well-clothed, well-friended, I
Did that chance act of good, that one;
Then went my way to kill and lie—
Forgot my good as soon as done.

"That germ of kindness, in the womb
Of mercy caught, did not expire;
Outlives my guilt, outlives my doom,
And friends me in the pit of fire.

"Once every year, when carols wake
On earth, the Christmas night's repose,
Arising from the sinners' lake
I journey to these healing snows.

"I staunch with ice my burning breast,
With silence balm my whirling brain;
O, Brandan! to this hour of rest
That Joppan leper's ease was pain."

Tears started to Saint Brandan's eyes,
He bow'd his head—he breathed a prayer—
Then look'd, and lo! the frosty skies!
The iceberg, and no Judas there!

*Better known as St. Brendan, the Navigator, after whom Mount Brandon, in Kerry, is named.

NOTES AND QUERIES.

A TIPPERARY RAPPAREE.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Dear Sir—Edmond O'Ryan, called Eamon-na-Cnoc, or Ned of the Hills, was a Tipperary rapparee after Sarsfield's time in Ireland. He is said to have been treacherously beheaded in 173[illegible]. His headless body is buried near Hollyford, Tipperary.

I am searching for information in regard to him. I have heard of two books treating of him—one stated to be about the size of Old Moore's Almanac, and another of a larger size, exposed for sale in Kilkee 30 years ago.

I would be much obliged for the information I require, or for directions where to obtain it, or for a loan or offer of sale of the books mentioned, or others on the subject, through your kind offices.

E. O'RYAN.

[We shall gladly take charge of any books that may be entrusted to us for the writer of the above query.—Ed. D. P. Journal.]

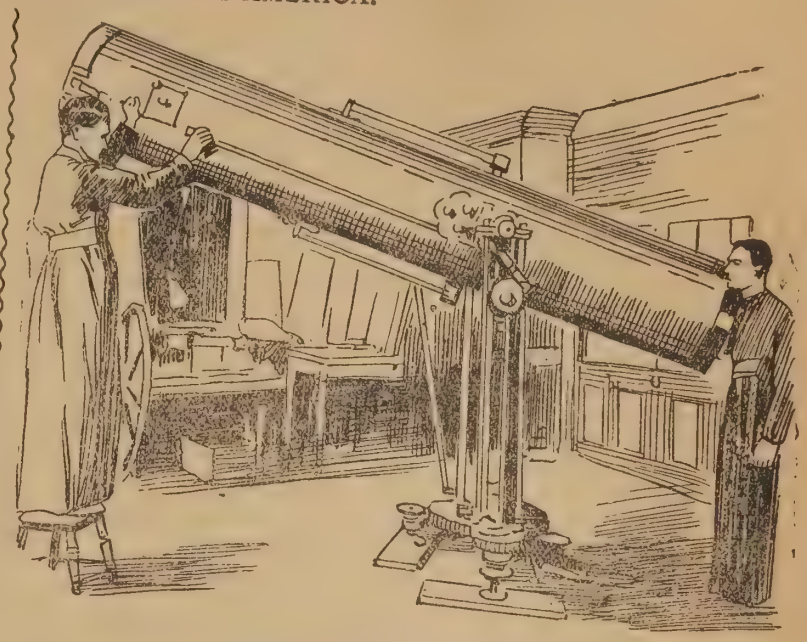
IRISH ORIGIN OF SCANDINAVIAN NAMES.

From C. F. Keary's "Vikings in Western Christendom" is copied the following passage, showing the Irish origin of some present-day Scandinavian surnames:—"Though there must be less Scandinavian blood in Ireland than England, the Northmen seem at their first coming to have mingled more with the rest of the people, identified themselves more with the national politics, so to speak, of Ireland, than they did at their first coming into England. The reason of this may very well have been the anarchic condition of the former country, which, whatever point they wished to attack secured from the invaders some allies. Let us note one proof only of the admixture of Celtic and Scandinavian blood during the Viking occupation of Ireland—the extreme commonness at this very day in all Scandinavian countries of the name Niel, and its derivations, Neillsen, Nelsen, etc., and Nelson, probably. Yet that name is not Scandinavian, it is true Irish, and every Scandinavian Niel, or Njall, from, as before, Burnt Njall, down to our Niels, Nielsens, and Nelsons must, doubtless, have had an Irish ancestor of the race of the northern or southern Hy. Njall. Cormac is another name which became common in Scandinavian countries, especially in Iceland. Such names would spring from marriages, which very early became fully recognised between the Vikings and the Irish. The Vikings attacked Cork Harbour for the first time in A.D. 822."

LECTOR.

"KING'S IRISH BIBLIOGRAPHY."

The attempt which has been made by Mr. J. King, 53 Khedive road, Forest Gate, London, to provide something in the way of a "Subject Guide for Irish Books" is one for which he deserves credit and thanks. That it is not perfect in any respect, the compiler frankly and fully admits in his introduction, but he rightly assumes that if perfection in completeness, arrangement, and the gathering of specialised information have yet to be waited for, nevertheless what he has done will prove of much use, especially to busy men. So much, indeed, must be conceded, and his work will be by no means without value for others, to whom the compiler appeals for help to do better at a later date. The present Subject Guide ought to serve at least to roughly blaze the way through the forest of Irish publications, and thus make easier the preparation of a more ideal work. We trust that the compiler's hope that the first edition of 2,000 copies will sell rapidly may be fulfilled. Each copy is well worth the moderate sum (one shilling) asked. Its speedy sale, the compiler says, will enable him to bring out a more complete "Irish Bibliography" in the near future.



A BIG CANADIAN TELESCOPE.

ITS CONSTRUCTION AT THE JESUIT COLLEGE, MONTREAL.

THIRD LARGEST IN NORTH AMERICA.

POLISHING THE MIRROR.

THE TELESCOPE COMPLETED.

THROUGH the courtesy of the Rev. Father Foullety, we are enabled to give our readers an account of an undertaking through which the Jesuit College at Montreal, Canada, has secured a telescope which satisfies all the demands made upon it (says the "Scientific American" of 24th ult.). The telescope was built from the designs of the Rev. Father Garais, by the members of the Jesuit College. The spherical mirror of this telescope is in point of size the third in North America, being excelled only by those of the Yerkes and Lick observatories. No little admiration is due to the man who has not only designed the whole and constructed the principal parts of so intricate an instrument, but who has moreover with his own hand erected the machinery required for its production.

We are informed that a lathe was put up, upon which the crude block of Mantois glass for the mirror was ground. The process used for cutting the mirror shows some novel and interesting features, and is best explained by reference to our diagrams.

A cast-iron wheel, four inches in diameter, C (Fig. 1)) was rapidly rotated by means of a driving belt, d, from the pulley, W. The wheel, C, was so fixed that it could be raised or lowered at will by means of a fine adjustment. Under it was placed the block of glass. This block, M, was firmly fixed upon the table, N, which could be rotated about a vertical axis by the handles, h h. The table, N, carrying the glass, could also be moved in a straight line parallel with the direction of the belt, d. From a reservoir, R, sand and water were fed upon the grinding wheel, C. The process adopted was as follows: The rapidly rotating wheel, C, was lightly applied to the glass block. While sand and water were continually fed from the tank, R, a slow rotary motion was given to the block by turning the handles, h h, the wheel, C, being gradually lowered as the glass wore away. In this way an annular channel was ground. The block was then moved in a straight line parallel to the belt, and outward from the pulley, so that the wheel, C, came nearer to the centre of the mirror; thereupon another

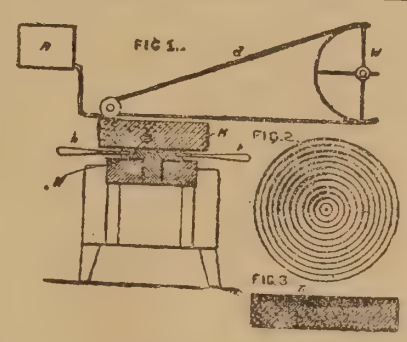


Diagram Illustrating the Method of Grinding the Lens.

rather deeper groove was ground close to and concentric with the first. In this way the block was worked until its condition was that shown in Figs. 2 and 3 in plan and section respectively. By a similar process the ridges, r, left by the first operation were next reduced. After this the remaining roughness was ground away with cast iron laps ruled with a network of interlacing furrows forming squares. It is gratifying to us to hear from Father Foullety that in this matter an article which appeared in the "Scientific American Supplement" (No. 582) helped to furnish the requisite information. For the polishing process, the mirror was fixed upon a cask, as shown in picture, and the operator, circling slowly and regularly around this, giving at the same time a rotating motion to the lap, worked the latter with great care over the surface of the glass, finally approximating it to a parabolic shape by polishing a little more toward the edges.

The final polish was effected with the finest emery, the lap being covered with a layer of wax half an inch thick. This delicate operation required about 50 hours' work. The whole of the grinding and polishing took some 320 hours.

The process used for silvering the mirror was that described in Troost's "Chemistry," French edition, 1884, p. 675. Four solutions are prepared.

1. 40 grammes of silver nitrate, dissolved in 1 litre of distilled water.

2. 60 grammes of ammonium nitrate, dissolved in 1 litre of distilled water.

3. 100 grammes of pure caustic potash, dissolved in 1 litre of distilled water.

4. 25 grammes of cane sugar, dissolved in 250 grammes of water, inverted by boiling for ten minutes with 3 grammes of tartaric acid, then neutralised, added to 50 grammes of alcohol, and made up to 500 c. c.

The glass was thoroughly cleaned with nitric acid, then with caustic potash. Alcohol was unnecessary. It was washed in pure water and suspended with the surface to the silver downward in the bath obtained by mixing the above solutions in equal volumes. The operation was carried on in a room kept at 80 deg. F. (27 deg. C.). The mirror was kept immersed for about ten minutes.

It next became necessary to construct the

tube and the mechanism for efficiently mounting the mirror. A wooden mould was fixed by radial supports upon an iron cylinder fifteen feet long. Upon this sheets of paper were rolled, and by gluing 250 pounds of paper sheet upon sheet, an excellent tube of great rigidity and strength was obtained, which for lightness probably surpasses anything which could have been made with other material.

The working gear was prepared at the foundries of Garth & Co. and of Belanger, both of Montreal, under the supervision and after the directions of Father Garais, who also designed all the parts and furnished the wooden models.

One of our illustrations, which gives a full view of the completed telescope, shows also the mechanism by which the motion in right ascension is effected. Motion in declination is produced simply by hand, by tilting the tube about its axle.

We close with a table which will give an idea of the general dimensions of the instrument:—Diameter of mirror, 20 inches; weight of mirror, 150 pounds; radius of curvature, 21 feet 9 inches; focal length, 10 feet 10½ inches; aperture, 4 deg. 18 min.; length of paper tube, 12 feet; weight of tube, 350 pounds; total weight of instrument, 1,200 pounds.

THE WATERFALL.

BY ROBERT DWYER JOYCE.

Where the moss-bronzed oaks are towering,
'Tween the rude rocks' hoary wall,
Into a chasm with sudden spasm
Rusheth the waterfall!
Breaking its prison thrall,
Bursting its rock bar,
Its voice rolls loud, from the bright spray cloud,
Over the hills afar!

All through the flame-browed Summer
'Twas but a tiny stream—
Brown Autumn gave the swelling wave,
And the fierce and fiery gleam,
Oh! wanderer, you would deem
That a bright-eyed monster there
Rushed out on thee with a roar of glee,
Mad from his yawning lair!

It springeth far in the hill-tops,
That torrent wild and rude,
And rolls along with its ancient song,
Through the deep solitude;
Then o'er the sedgy wood,
Down from the torn cliff,
With a sudden sweep it taketh its leap,
Into that caverned rift!

It boils, and writhes, and hisses,
As it leapeth down amain;
And its quivering roar shakes the valleys hoar,
Like a Titan's yell of pain!
Then darting on again,
Swiftly its wild waves go,
Winding away in their azure play,
Through the widening vales below!

Each moon-bright Hallow-even,
Go sit by that cataract lone;
And there a dream thou'lt hear by the stream,
The fairy trumpets blown—
O'er dingle and dell, and stone,
Thou'l't see them dance along,
Save one bright maid, who sings in the shade,
A low and mournful song!

The memorial tablet to Dickens and Landor were unveiled by Mr. Percy Fitzgerald at Bath on Saturday last, and enthusiasts gathered at the Assembly Rooms, there to discuss Dickens, "Pickwick"—and milk punch. The Mayor presided at the dinner.

Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

DUNLEER.

DUNLEER, a post-town and parish (formerly a Parliamentary borough), in the barony of Ferrard, county of Louth, and province of Leinster, 10 miles (S.E.) from Dundalk, and 30 (N.) from Dublin, on the great north road to Belfast. This place appears to have been first brought into notice by its proprietor, George Legge, Esq., ancestor of the Dartmouth family, to whom Chas. II., in 1671, granted a market and fairs; and on whose petition, for the greater encouragement of settlers, the same monarch, in 1673, incorporated the inhabitants by charter. The corporation returned two members to the Irish Parliament till the Union, when the borough was disfranchised, and the £15,000 awarded as compensation was paid in equal moities to the Right Hon. John Foster, Speaker of the Irish House of Commons, and to Henry Coddington, Esq.

ENNIS.

ENNIS, a borough, and market-town, in the parish of Dromcliffe, barony of Islands, county of Clare (of which it is the chief town), and province of Munster, 18 miles (N.W.) from Limerick, on the mail road to Galway, and 111¾ (S.W.) from Dublin. This place derives its name, formerly spelt Innis or Inish, signifying an island, from the insulation of a considerable plot of ground by the river Fergus. According to the Ulster Annals, it was anciently called "Iniscluan-ruadha," and one of its suburbs is still called Clonroad. Mac Curtin states that it was eminent as a seat of learning, upwards of 600 scholars and 350 monks having been here supported by O'Brien, prince of Thomond, after the arrival of the English. About the year 1240, Donogh Carbrac O'Brien erected a noble monastery at Ennis for Franciscan friars, which in 1305, according to the Annals of Innisfallen, was rebuilt or repaired and much adorned by another branch of that family. It was for a long period the place of sepulture of the princes of Thomond, and occasionally of the chiefs of the sept of Mac Namara; and its prosperity appears to have been in these times dependent on this circumstance. In 1306, Dermot, grandson of Brien-Roe, at the head of a body of native and English forces, entrely destroyed the town. In 1311, Donogh, King of Thomond, bestowed the whole revenue of his principality for the enlargement and support of this monastery, and some time after the refectory and sacristy were built by Mathew Mac Namara. It is recorded in the Ulster Annals that Terence O'Brien, Bishop of Killaloe, was here barbarously slain, in 1460, by Brien O'Brien. The friary was reformed by Franciscans of the Strict Observance: it remained in the Crown for some time subsequent to the Reformation, and was granted, in 1621, to Wm. Dongan, Esq. In 1609, Donogh, or Donat, Earl of Thomond, obtained a grant of a market and fairs to be held here; and in 1612 "the town of Inish" was created a borough. In 1661 the goods of some of the townspeople were seized in payment of salary due to Isaac Granier one of their representatives in Parliament, but were released on their stating that he had agreed to serve gratuitously as their representative.

It is situated nearly in the centre of the county, on the principal or south-western branch of the river Fergus, which surrounds a portion of the town and its north-eastern suburbs. By the charter of the 10th of Jas. I. (1612), the corporation, under the style of "The Provost, Free Burgesses, and Commonalty of the Town of Ennis," consists of a provost, twelve free burgesses, and a town clerk, with power to admit an unlimited number of freemen to constitute a "commonalty." The borough sent two members to the Irish Parliament prior to the Union. The remains of the Franciscan abbey, founded by the Kings of Thomond, of whom several were interred in it, still present many traces of its ancient grandeur. Of these, the principal is the grand eastern window, upwards of 30 feet high, consisting of five lancet-shaped compartments, separated by stone mullions, and universally admired for its exceedingly light proportions and beautiful workmanship. In the chancel is the "Abbot's chair," which, with the altar, is richly sculptured with figures in high relief; and some of the ancient monuments, also profusely sculptured, still exist.

AN ECLIPSE IN CHINA.

In China an eclipse of the sun or of the moon is regarded as an evil augury for the Emperor, intended to warn him to examine himself and correct his faults. Hence an eclipse is always looked on as an affair of state, and the greatest care is taken to calculate the time when it will happen. M. Edmund Plauchut in his book, "China and the Chinese," describes a scene he witnessed when the moon played the astronomers of Pekin a mean trick.

The imperial astronomers had announced that on February 7th, at eight o'clock in the evening, the dragon which wanders to and fro in the regions of the air would endeavour to swallow the moon.

The eclipse was to be total, so the astronomers had warned the people that the attack of the monster would be terrible, and that the moon would very likely succumb if the shouts and noise of the gongs did not put the dragon to flight.

Long before the appointed time millions of Chinese issued from the towns to the open country, there, nose in air, to watch the wonderful phenomenon.

Those who had been unable to get gongs had provided themselves with saucepans, rattles, pieces of bamboo stems, and immense quantities of little red fire crackers.

But what a disappointment! At eight o'clock the gazing multitudes saw the moon rise, a full unspotted disc, without a sign of anything unusual. At nine she was still shining pure. Just as all hope was disappearing, a tremendous noise began on every side, for the watchers saw a black spot advancing slowly across the face of the moon.

It is impossible to describe the rage with which the Chinese beat their pans and gongs, whirled their rattles, and let off the crackers. The dragon was evidently frightened away by the row, for after looking up at the full moon for an hour and seeing nothing more of the black spot, the crowds, jubilant over their victory, began to disperse.

It was learned later that the Emperor sent word to the astronomers that the next time they made such a miscalculation he would relieve them of their appointments and send them into exile.

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

By CHARLES SMITH, M.D.

Æquum est enim meminisse & me, qui disccrem hominem esse et vos, qui Judicetis ut si probabilia dicentur nihil ultra requiratis. Cicero Univers

In Two Volumes.

VOL. I.

The Second Edition, with Additions.

Chapter IV.—Continued.

Ross, or Ross-Carbery, was formerly called Ross-Alithri, i.e., the field of pilgrimage. It was granted by Fitz-Stephen and Cogan to Adam Roche, except the Bishop's lands. Hammer, in his chronicle, p. 53, says this town was walled about by a lady of that country; but by the wars of the Irish septs, particularly the Cartys, Driscols, &c., the foundations could scarce be traced. He adds, "that there was in it anciently a famous university, whereto resorted all the S.W. part of Ireland for learning sake." In this school, St. Brendan was reader. It may not be amiss to observe that it was an Irish professor who first opened the public schools at Oxford, which shows how famous this island hath been in ancient times for learning; and at this day it does not seem to have a better chance for being considerable. Cambden observes that the Saxons flocked to Ireland, as to a great mart of learning, which is the reason, says he, why we so often find this in our writers, such a one has sent his son over to Ireland to be educated (6). It is now a small market town, and Bishop's see. The Cathedral is supposed to have been founded by Saint Fachnan, who flourished in the beginning of the 6th century. The writer of the life of Saint Mocoemoge (who founded the church of Kineigh, an ancient bishoprick, but united to this diocese before the arrival of the English) calls him a man of wisdom and probity. He was named Fachnan Mongach, or the hairy, being born with hair; he was abbot of the abbey of Molana, an island in the Black-water, near Youghal. The same ancient writer relates the following passage of St. Fachnan, his abbey, and school: "Saint Fachnan lived in a monas-"tery of his own foundation; There is a "city grown up, in which always continued "a large seminary for scholars, which is "called Ross-Alithri." This saint is, in an ancient martyrology (7), called bishop, and his festival is observed on the 16th of August.

Saint Fachnan also founded an abbey here of regular canons, the ruins of which remain (8). The cathedral is a small, neat, gothic structure; the choir seems to be modern. On the south side of the altar is a small monument to the memory of Sir William Moore, of Ross-Carbery, who died the 28th of August, 1693, aged 31. The stalls, being newly erected, are neat and well disposed. In the S. wing, is an handsome chapter room. Here is a small square steeple, battlemented on the top. The church-yard is washed by an arm of the sea that flows up to the town, and is prettily planted with trees.

The harbour, according to Cambden, was formerly navigable for ships, but in his time it was quite choked up with sand; and it is now so shallow that no vessel can come up to the town; so that one may justly apply those lines of Spenser to this place:

> There also where the winged ships were seen,
> In liquid waves to cut their foamy way,
> And thousand fishers numbered to have been
> In that wide lake looking for plenteous prey
> Of fish, which they with bait used to betray;
> Is now no lake, nor any fisher's store,
> Nor ever ship shall sail there any more.
> Spensr's Ruines of Time.

In this town is a good foot barrack, and a small market house, with some other good houses.

Near the cathedral, about three years since, there were discovered several subterraneous chambers, of which I intend to give a more particular account in another part of this work. About a mile west of Ross are two remarkable great holes in the ground, 80 yards deep, and each about 300 yards from the cliffs, into both which the sea flows by subterraneous passages; these holes are called E. and W. Pouladuff; one is on the lands of Downeen, and the other on Tralong.

A mile N.W. of Ross stands Banduff, now Castle-Salem, built by the Donovans.

(6) Bede, in his ecclesiastical history (lib. 3. c. 7. and 27), often mentions particular persons, who were sent over into Ireland to be educated; and Cambden relates this passage in the life of Sulgenius, who flourished 600 years before his time:

> Exemplo patrum commotus amore legendi
> Juvit ad Hibernos, sophia mirabile claros.
>
> With love of learning, and examples fir'd
> To Ireland, fam'd for wisdom, he retir'd.

And perhaps, says the same author, our forefathers, the Saxons, took the draught and form of their letters from them; their character being the same with that at this day used in Ireland. Camb. in Hibern.

Diodorus Siculus (Lib. 3.) has preserved an account, out of Hecateus, a very ancient author, "of a northern island, little less than Sicily, situated over against the Celtæ, and inhabited by those whom the Greeks called Hyperboreans. It is, says he, fruitful, pleasant, and dedicated to Apollo; that God, for the space of 19 years, used to come and converse with them; and, which is more remarkable, they could (as if they had the use of telescopes) show the moon very near them, and discover therein mountains, etc. They had a large grove and temple of a round form, to which the priests frequently resorted with their harps, to chaunt the praises of Apollo, their great deity. He says they had a language of their own, and that some Greeks had been in it, and presented valuable gifts to this temple, with Greek inscriptions on them: and that one Abaris, who became afterwards a disciple of Pythagorus, went hence into Greece, and contracted an intimacy with the Delians." The situation of this island opposite to the Celtæ, who were the inhabitants of Britain and Gallia, its being compared with Sicily in size, its being dedicated to Apollo, i.e., the sun, which planet the Irish certainly worshipped. The description of their temples, which were always round, and the mention of their harps, are all so many concurring circumstances, which seem more than probable that this could be no other than Ireland. For the Mona or Anglesy of Rowland, is too inconsiderable a spot to be meant here (Vide Rowland's Mona Antiqua. p. 76). And if the learned of this island, who were then the ancient Druids of it, could, as with telescopes, show the moon nearer, it may be supposed that they had made greater progress in those sciences than is generally imagined. The 19 years converse with Apollo, which is the cycle of the sun, the notion of the moon's opacity, and of its mountains, rocks, etc, argue them to have been no bad astronomers. I have seen schemes of the Ptolemaic system, in some Irish MSS. of very great antiquity; it is also very remarkable, that they have a tradition at Lismore (where was formerly a celebrated school) of several Greeks, having studied there in former times, and that said school was founded by two Greek princes.

(7) Martyr. of Cashel.

(8) The following is a catalogue of the succeeding Bishops, whose names have been preserved.

St. Finchad succeeded St. Fachnan, being a disciple of St. Finbar, of Cork.

There is no account of any of the successors of this saint, till the arrival of the English, except one Dongal Mac Folact, whom Flaherty mentions in his Ogygia, and makes the 27th Bishop from Fachnan, all of the same family; and, for his authority, quotes an Irish distich, out of the books of Lechan, which he thus translates.

> Dongalus a Fachtna ter nonus episcopus, extat
> Lugadia de gente, dedit cui Roffia mitram.

Which distich has thus been paraphrased:

> Hail happy Ross! that cou'd produce thrice nine,
> All mitred sages of Lugadia's line;
> From Fachnan, crowned with everlasting praise,
> Down to the date of Dungal's pious days.

Benedict was bishop in 1172, and sat about 18 years.

Maurice, who succeeded, died in 1196.

Daniel; concerning the indirect means he used to intrude into this see. Vid. the Hist. of the bishops of Ireland, p. 584.

Florence sat in 1210, and died in 1222.

Robert, alias Richard, was bishop, ann. 1225.

Florence, or Finceu O-Clogheena, resigned in 1252.

Maurice, chanter of Cloyne, was made bishop in 1255, and died in 1269.

Walter O-Micthain succeeded in 1259, and died in 1274.

Peter O-Hallechan succeeded in 1275, and died in 1290.

Laurence succeeded in 1290 and died in 1309.

Matthew O-Fin succeeded in 1310. He recovered by default, and restored to this see several of its possessions, which had been unjustly usurped, by Thomas Barret and Philip de Carew. The Crown thought this recovery was by collusion, to avoid the penalties of the stat. of mortmain; therefore, an inquest was held to try the collusion. But the jury found in favour of the bishop. He died in 1330.

Laurence O-Holdecan succeeded in 1331, and died in 1335.

Denis succeeded in 1336; he died in 1377.

Bernard O-Connor succeeded in 1378.

Stephen Browne succeeded in 1402.

Matthew died in 1418.

Walter Formay succeeded in 1418, and died in 1424.

Cornelius Mac-Elchade succeeded in 1426.

Thady sat in 1488.

Edmund de Courcey succeeded in 1494, and died in 1518.

John Imurily succeeded in 1519, and died the same year.

Bonaventure sat ann. 1523.

Dermot Mac-Domnuil sat in 1544; he died ann. 1552.

Thomas O-Herlihy sat in 1563, and resigned in 1570. He was a member of the Council of Trent.

William Lyon succeeded in 1582, and died ann. 1617.

From this time, this see was united to that of Cork, under which the successors of Ross are given.

It is possessed by Mr. Morris, and is a strong, romantic building. About a mile west of Ross runs the river Rory; near it, at Ballyvenine, stands the ruins of the largest house in Carbery, erected by Sir Walter Coppinger, who also designed to build a market-town here; but was hindered by the rebellion of 1641, in which wars this house was destroyed. The soil between this and Ross is a light grey clay, mixed with sand; their manure is sea-sand, which affords them plenty of corn, potatoes, and some flax.

Thre miles W. of Ross is Glandore harbour, which, though small, is an exceeding good one; and near it is a castle of the same name. At the upper end of this harbour is a deep and dangerous glen, called the Leap, on both sides of which is the high road from Ross to the other parts of W. Carbery. The road crosses this glen, which is here as steep as a flight of stairs, so that few horses, but those who are well used to it, attempt it with courage. To the west of this precipice is an handsome seat, called Brede, with large plantations of Samuel Jervais, Esq. At Keamore, above the Leap, is a very extensive prospect of a great part of the sea coast, with the harbours of Glandore and Castlehaven.

On the west end of Glandore bay, not far from the Leap, by the working of the sea, a large part of the hill fell down, on which grew several trees; this piece formed an island of about 20 yards in circumference, and the trees continued to grow; but it is now almost quite washed away.

On the west side of Glandore harbour is the parish of Miros, called, in Irish, Garry, i.e., the garden, from its being much better land than the rest of W. Carbery. In this parish was anciently an abbey, called de Sancto Mauro, also de fonte vivo, founded anno 1172 by Dermot Mac-Cormac Carty, of Kilbawne, who was King of Cork, for Cistercian monks, which he brought from the abbey of Baltinglass. At a place called Carigiliky, in this parish, the foundation of extensive ruins were discovered, together with a large cemetery, with great quantities of human bones; it was, probably, the site of the abbey de Sancto Mauro, which some falsely place at Abbey-Mahon, near Timoleague. The house of abbey Shrowry was a cell to this; the parish church stands in ruins on the coast, and opposite to it, in a small island, called Arahas, is a ruined chapel.

Near Glandore harbour is another island, called the Squince, which produces a wonderful sort of herbage that recovers and fattens diseased horses to admiration.

In this parish is Banlaghan, the seat of O'Donovan, chief of that ancient family, a worthy, courteous gentleman.

The west side of this parish is bounded by the bay of Castlehaven, formerly called Glanbarrahane, and, by the Spaniards, Porto Castello, famous for a notable sea-fight between Sir Richard Levison and Don Pedro de Zuibar, the Spanish admiral, anno 1602. Near the entrance is an old castle to command the harbour; but the hills adjoining command the castle. The place formerly belonged to O'Driscoll, and afterwards to the Audley family (9). George, Lord Audley, who was Governor of Utrecht, and was sore wounded at the Battle of Kinsale, anno 1602, was, for his eminent services, created Earl of Castlehaven and Baron of Orier, in the county of Armagh, by letters patent, September 6, 1617, 14 Jac. I. The parish church of Castlehaven is dedicated to Saint Barahane; and near it is a deep, rocky glen, called Glanbarahane. There was, some years ago, a linen manufacture at Killehanghill, near this place, but it is now ceased.

The eastern point of this harbour is called Galleon Point, on which are the remains of entrenchments cast up by the Spaniards, and the ovens used by them are also still to be seen. On this side are the ruins of Rahine Castle, which belonged to the O'Donovan's. In the walls are several cannon ball, which were shot at it from some vessels in the harbour. On the western side of Castlehaven is Horse-Island, being of the same nature of the Squince island, above-mentioned, for curing horses. On the banks of the river stands Castletown, now Castle-Townshend, and formerly Slughleig, where there is a new erected castle of some strength, being situated on the side of an hill. This is the seat of —— Townshend, Esq., where boats may land at the door. Off this bay is a good fishery; and in it are excellent oysters, the water being eight fathom deep in most places. Castletown is a small, but well-looking village. An high promontory called the Toe-head, stands a little to the westward of Castlehaven, due south of which, in the ocean, are the high, steep rocks, called the Stags, which being always to be seen, are easily avoided; but I shall refer the hydrographical description of the coast to a particular chapter.

Some years ago the Rev. Dean Swift spent a summer at a clergyman's house (since also dead) in the parish of Miros; he often diverted himself in making little voyages on the coast, from Glandore harbour towards Baltimore; and these excursions occasioned his Latin poem, called Carberiæ Rupes, which he wrote in June, anno 1723. Having made the same voyage more than once, I had the pleasure of observing that the Dean's descriptions were as just as his numbers were beautiful, which I shall beg leave to insert in this place:

Ecce! ingens fragmen scopuli quod vertice summo
Desuper impendet nullo fundamine nixum
Decidit in fluctus: maria undiq; & undiq; saxa
Horrisono stridore tonant, & ad æthera murmur
Erigitur; trepidatq; suis Neptunus in undis.
Nam longa venti rabie, atq; aspergine crebra
Œquorei laticis specus ima rupe cavatur:
Jam sultura ruit, jam summa cacumina nutant;
Jam cadit in præceps moles, & verberat undas.
Attonitus credas, hinc dejecisse tonantem
Montibus impositos montes, & Pelion altum
In capita anguipedum cœlo jaculasse gigantum.
Sæpe etiam spelunca immani apperitur hiatu
Exesa è scopulis, & utrinq; foramina pandit,
Hinc atq; (10) hinc a ponto ad pontum pervia Phœbo,
Cautibus enormè junctis laquearia testi
Formantur; moles olim ruitura supernè.
Fornice sublimi nidos posuere palumbes,
Inq; imo stagni posuere cubilia Phocæ.
Sed, cum sævit hyems, & venti carcere rupto
Immensosvolvunt fluctus ad culmina montis;
Non obsessæ arces, non fulmina vindice dextrâ
Missa Jovis, quoties inimicas sævit in urbes,
Exæquant sonitum undarum, veniente procellâ:
Littora littoribus reboant; vicina latè,
Gens assueta mari, & pedibus percurrere rupes,
Terretur tamen, & longè fugit, arva relinquens
Terretur tamen, & longè fugit, arva relinquens.
Gramina dum carpunt, pendentes rupe capellæ
Vi salientis aquæ de summo precipitantur,
Et dulces animas imo sub gurgite linquunt.
Piscator terrâ non audet vellere funem;
Sed latet in portu tremebundus, & aëra sudum
Haud sperans, nereum precibus votisq; fatigat (11)

(To be Continued.)

(9) On the 12th of February, 1601-2, the garrison of Castlehaven surrendered to Captain Harvey, who took possession of it for Queen Elizabeth. The same day that the Spaniards quitted it, the O-Driscols, who had the inheritance of it, by flight, got into the castle, and made themselves masters of it. The Spaniards assaulted it, and were undermining the same when Captain Harvey came into the haven; but upon sight of his ships, the Irish, by composition to depart in safety, rendered it to the Spaniards, who had lost two of their soldiers in the attempt; and the Spaniards delivered it up to the captain.

Pacat. Hiebrn.

(10) This alludes to a stupendous arch, through which a boat may row. It is in the parish of Miros, and not far from the place where the dean usually embarked. Near the W. head of Castlehaven, are deep caves, which are low at the entrance, but grow higher within: The swell of the sea raises a boat up to the roof almost when one is in; which also by turns, closes up the entrance, and makes them very dark and gloomy.

(11) For the sake of the English reader, I shall fashion the following translation, by the Rev. Dr. Dunkin.

Lo! from the top of yonder cliff, that shrouds
Its airy head amidst the azure clouds,
Hangs a huge fragment, destitute of props,
Prone on the waves the rocky ruin drops.
With hoarse rebuff the swelling seas rebound
From shore to shore, the rocks return the sound;
The dreadful murmur heav'ns high conclave cleaves,
And Neptune shrinks beneath his subject waves;
For long the whirling winds and beating tides
Had scoop'd a vault into its nether sides;
Now yields the base, the summits nod, now urge
Their headlong course, and lash the sounding surge.
Not louder noise cou'd shake the guilty world,
When Jove heap'd mountains upon mountains hurl'd,
Retorting Pelion from his dread abode,
To crush earth's rebel sons beneath the load.
Oft, too, with hideous yawn, the cavern wide
Presents an crifice on either side;
A dismal orifice, from sea to sea
Extended, pervious to the god of day:
Uncouthly join'd, the rocks stupendous form
An arch, the ruin of a future storm:
High on the cliff their nests wild pigeons make,
And sea calves stable in the ouzy lake.
But when the bleak winter with her sullen train,
Awakes the winds, to vex the watry plain;
When o'er the craggy steep, without controul,
Big with the blast, the raging billows rowl;
Not towns beleagur'd, not the flaming brand
Darted from heav'n by Jove's avenging hand,
Oft as on impious men his wrath he pours,
Humbles their pride, and blasts their gilded tow'rs,
Equal the tumult of this wild uproar;
Waves rush o'er waves, rebellows shore to shore.
The neighbouring race, tho' wont to brave the shocks,
Of angry seas and run along the rocks,
Now pale with terror, while the ocean foams
Fly far and wide, nor trust their native homes.
The goats, while pendant from the mountain top,
The wither'd herb improvident they crop.
Wash'd down the precipice with sudden sweep,
Leave their sweet lives beneath th' unfathom'd deep.
The frighted fisher, with desponding eyes,
Tho' safe, yet trembling, in the harbour lies,
Nor hoping to behold the sky serene,
Wearies with vows the monarch of the main.

THE IRISH FUNERAL CRY.

(Abridged from "Dublin Penny Journal," 1833.)

The well known custom so long used in this country, of keening, or lamenting over the dead, is of the most remote antiquity. History informs us that it was known to the Greeks and Romans, who, however, seem to have borrowed it from the Eastern nations, among whom probably it had its origin; and from the Scriptures we learn that it was practised among the Israelites. Dr. O'Brien tells us that the word in the Irish language, as originally and more correctly written, is "cine," and not, as modern orthoepists have it, "caoine"; and this makes it almost identical with the Hebrew word "cina," which signifies lamentation or weeping with clapping of hands. The learned Jezreel Jones, in speaking of the Shillah or Tarmazeght, a language or dialect of the inhabitants of the mountainous part of south-western Barbary, in a letter to John Chamberlayn, dated "Westmonasterii, 24 December, 1714," declares that "the Shilenses have the same custom as the Arabs, the Jews, and the Irish, of lamenting over their dead, uttering various cries of grief, tearing their hair, and asking the deceased why did he die? why did he leave them, and desiring that death would seize them also, in order that they might rejoin him whom they lamented." According to an old work, Armstrong's "History of Minorca," the peasantry of that island in their lament, ask the dead "if he had not food, raiment, and friends—and wherefore then did he die?" Sir Walter Scott informs us that the "coronach" of the Highlanders is precisely similar to the "ululatus" of the Romans, and the "ullaloo" of the Irish; that the words of it are not always articulate, but when they are so, they express the praises of the deceased, and the loss the clan would sustain by his death.

The funeral song introduced in Shakespeare's beautiful play of Cymbeline, where the scene is laid in Wales, upon the supposed death of the disguised Imogen, will, no doubt, recur to some of our readers.

From the fourth volume of the "Transactions of the Royal Irish Academy," we transcribe the following passages, descriptive of the ancient observance of the custom:—

"The Irish have always been remarkable for their funeral lamentations, and this peculiarity has been noticed by almost every traveller who visited them; and it seems derived from their Celti cancestors, the primæval inhabitants of this isle. Cambrensis, in the twelfth century says, the Irish then musically expressed their griefs; that is, they applied the musical art, in which they excelled all others, to the orderly celebration of funeral obsequies, by dividing the mourners into two bodies, each alternately singing their part, and the whole at times, joining in full chorus.

"The body of the deceased, dressed in grave clothes, and ornamented with flowers, was placed on a bier, or some elevated spot. The relations and "keeners" (singing mourners) then ranged therselves in two divisions, one at the head, and the other at the foot of the corpse. The bards and croteries had before prepared the funeral caoinan. The chief bard of the head chorus began by singing the first stanza in a low doleful tone, which was softly accompanied by the harp; at the conclusion, the foot semi-chorus began the lamentation, or "ullaloo," from the final note of the proceeding stanza, in which they were answered by the head semi-chorus; then both united in one general chorus. The chorus of the first stanza being ended, the chief bard of the foot semi-chorus began the second gol, or lamentation, in which they were answered by that of the head, and as before, both united in the general full chorus. Thus alternately, were the song and the choruses performed during the night. The genealogy, rank, possessions, the virtues and vices of the dead were rehearsed, and a number of interrogations were addressed to the deceased: as, why did he die? If married, whether his wife was faithful to him, his sons dutiful, or good hunters or warriors? If a woman, whether her daughters were fair or chaste? If a young man, whether he had been crossed in love? or if the blue-eyed maids of Erin had treated him with scorn?"

In ancient times it was the duty of the bard who was attached to the family of each chief or noble, assisted by some of the household, to raise the funeral song; but, at a more recent period, this has been entrusted to hired mourners, who were remunerated according to the estimation in which their talents were held. We are told that formerly the metrical feet of their compositions were much attended to, but on the decline of the Irish bards these feet were gradually neglected, and they fell into a kind of slipshod metre among the women who have entirely engrossed the office of keeners or mourners.

Till about the middle of the last century, the custom was very generally adhered to in Ireland, as well in families of the highest condition, as among those of the lower orders; and many of the elegiac poems, composed on such occasions, have come down to us, which by their figurative language, and highly poetical imagery, evince astonishing genius, and are strongly indicative of the natural talent of our people. The learned Dr. Adam Clarke has preserved one of considerable beauty, the music of which, he tells us, though rude and simple, is nevertheless bold, highly impassioned, and deeply affecting, and is often used among the descendants of the aboriginal Irish on funeral occasions. We, however, prefer giving the following "lament of Morian Shehone for Miss Mary Bourke," which is literally translated from the original Irish:—

"Silence prevails; it is an awful silence. The voice of Mary is heard no longer in the valley.

"Yes, thou art gone, O Mary! but Morian Shehone will raise the song of woe, and bewail thy fate.

"Snow white was thy virtue; the youth gazed on thee with rapture; and old age listened with pleasure to the soft music of thy tongue.

"Thy beauty was brighter than the sun which shone around thee, O Mary! but thy sun is set, and has left the soul of thy friend in darkness.

"Sorrow for thee is dumb, save the wailings of Morian Shehone; and grief has not yet tears to shed for Mary.

"I have cried over the rich man; but when the stone was laid upon his grave, my grief was at an end; not so with my heart's darling; the grave cannot hide Mary from the view of Morian Shehone.

"I see her in the four corners of her habitation, which was once gilded by her presence.

"Thou didst not fall off like a withered leaf, which hangs trembling and insecure: no, it was a rude blast which brought thee to the dust, O Mary!

"Hadst thou not friends? Hadst thou not bread to eat, and raiment to put on? Hadst thou not beauty, Mary? Then mightest thou not have been happy?

"But the spoiler came, and disordered my peace: the grim tyrant has taken away my only support in Mary!

"In thy state of probation, thou wert kind hearted to all, and none envied thee thy good fortune. Oh! that the lamentations of thy friends—Oh! that the burning tears of Morian Shehone could bring back from the grave the peerless Mary!

"But, alas! this cannot be: then twice in every year, while the virgins of the valley celebrate the birth and death of Mary, under the wide spreading elm, let her spirit hover round them, and teach them to emulate her virtues.

"So falls into the depth of silence the lament of Morian Shehone."

Of late years the custom has fallen into disuse, and is now of rare occurrence, except in some very few old families, and among the peasantry, and with them it has now generally degenerated into a mere cry of an extremely wild and mournful character, which, however, consisting of several notes, forming a very harmonious passage, approaches to a species of song, but is almost always destitute of words.

The crowd of people who assemble at the funerals of the peasantry in some parts of the country is amazing, often exceeding a thousand persons, men and women. They gather as the bearers of the hearse proceed on their way, and when they pass through any village, or approach any houses, the wail swells out still louder than before, which gives notice that a funeral is passing, and immediately the people flock out to follow it. In the province of Munster it is said that it is a common thing for the women to follow a funeral, to join in the universal cry with all their might and main for some time, and then to turn and ask, "Arrah! who is it that's dead? Who is it we're crying for?" The peasantry every where are wonderfully eager to attend the funerals of their friends and relations, and they make their relationship branch out to a great extent. The proof that a poor man has been well beloved during his life is his having a crowded funeral. Even the poorest people have their own burying places, that is spots of ground in the churchyards, which are situated sometimes in the wildest parts of the mountains, their situation indicated by some remnant of a ruin, and a few scattered tombstones and the low green hillocks of the graves. Here, they say, their ancestors have been buried ever since the wars of Ireland; and, though these burial places should be many miles from the place where a man dies, his friends and neighbours take care to carry his corpse thither.

NIGHT.

(From the German of Branner).

Gather, ye sullen thunder clouds;
Your wings, ye lightnings, wave,
Like Spirits bursting from their shrouds;

And howl, thou wild and dreary storm,
Like echoes of the grave,
Sounds of the brothers of the worm.

Ay, wilder still, ye thunders, roll,
Ye lightnings, cleave the ground:
Ye cannot shake the Christian soul:

In God's high strength she sits sublime,
Though words were dust around;
Defying Chance, outliving Time.

ALUMINUM FOR POWER TRANSMISSION.

One of the growing uses of aluminum is as a substitute for copper wire in the transmission of electric power over long distances. Alloyed with one and one-half per cent. of copper, it is thus used in transmitting 12,000 horse-power from the Snoqualmie Falls to the cities of Tacoma and Seattle, a distance of more than 40 miles. This alloy is at the same time so light and so strong that spans of 150 feet are safely made, thereby effecting a great saving in the number of poles needed on the line. But this applies only to bare conductors. Where insulated cables are required, the increased diameter of the alumnium conductor involves increased cost, and where lead is used for insulation the gain of weight obtained in bare aluminium cables is cancelled.

LITERARY NOTES.

Doctor Thomas O'Hagan, author of "In Dreamland," "Songs of the Settlement,' and several works in prose will in the near future bring out a new volume of Irish-Canadian verse, "The Maple and the Shamrock."

✧ ✧ ✧

The "Literary World" prints a list of "Fifty Representative Historical Novels," compiled by Mr. Jonathan Nield, who some months ago published a volume containing a list of romances covering practically the whole field of history. The list is distinctly interesting. Mr. Nield has included no book of doubtful pretensions, and the periods dealt with range from the sixth century B.C. to 1825.

✧ ✧ ✧

Mr. Henry Arthur Jones, answering the question of "T. P.'s Weekly" concerning the "Books of My Childhood," says:—

The "Pilgrim's Progress." What a dramatist Bunyan might have made if he had not fallen into the hands of the Puritans!

Does Mr. Jones (asks the "Academy") always read in terms of the Drama? Bunyan would have made one of the worst dramatists in the world.

✧ ✧ ✧

The dispute which has arisen between the friends of the late Mr. George Douglas Brown, author of "The House with the Green Shutters," and an "unauthorised" biographer is unfortunate. Apparently the biography which the late novelist's friends desire to suppress, with the aid of the Law Courts, is the one announced by Messrs. Hodder and Stoughton, unless, indeed, there is a second biographer in the field. Mr. Cuthbert Lennox is the author of the announced and denounced memoir, and Mr. Andrew Lang is its sponsor and introducer.

✧ ✧ ✧

It is possible to say with some certainty what are the best books on historical, scientific, or philosophical questions, but who is to decide which are the best current novels? A contemporary gives the following as the "Best New Novels":—"Lord Leonard the Luckless," W. E. Norris; "The Private Papers of Henry Ryecroft," George Gissing; "The Golden Kingdom," Andrew Balfour; "The Red House," E. Nesbitt; "The Countless Londa," Guy Boothby; "The Gates of Wrath," Arnold Bennett; "The Circle," Katherine Thurston; "The Riggleses and Others," Evelyn E. Rynd; "Anthea's Way," Adeline Sergeant; "A Mixed Marriage,' Mrs. Frank Penny. We do not suppose that any two people would accept this selection as it stands.

✧ ✧ ✧

It appears that in Germany there is now a Poet's Trust. The lyrical poets of that practical country, to the number of about seventy, met some time ago to consider the matter of remuneration; perhaps pay would be a better word in the circumstances. They decided that they were not receiving high enough terms, and they have now entered into a compact not to accept less than sixpence a line. We sympathise, remarks the "Academy and Literature," with the gentlemen whose lyric fervours were rewarded with less than this; we sympathise, too, with the editors whose hands are to be forced, if the forcing comes about. To have seventy poets in a country, each of whom writes verses worth sixpence a line, must be a sore trial.

✧ ✧ ✧

The Great Storm of 1703, the memory of which has been so long kept alive at the Little Wild street Chapel (London), now being pulled down, will be brought to mind—especially this year—by the fact that it made Addison's fortune. His famous simile of the Angel in his description of Marlborough's conduct of the battle of Blenheim was paid for indirectly and ultimately, at a rate per line which has probably never been approached:—

So when an angel by divine command
With rising tempests shakes a guilty land,
Such as of late o'er pale Britannia past,
Calm and serene he drives the furious blast;
And, pleased the Almighty's orders to perform,
Rides in the whirlwind, and directs the storm.

This simile not only procured Addison instant reward, but it took the sting out of the jibe to which the poem as a whole was open, of being "a gazette in rhyme."

✧ ✧ ✧

Maxim Gorky has achieved a mighty success in Russia with his new play, which was received at Moscow with enthusiasm unequalled in the history of the Russian stage. The well-known dramatic critic of the St. Petersburg "Noviski" writes that, although he has grown grey in the service of the theatre, he has never been present at such a first-night. "It was the apotheosis of a new literary idea. Maxim Gorky has proved himself a powerful sovereign of thought." He describes the play as a revolution breaking down all the old conventions—a revolution accomplished in the name of the rights of life and humanity. "It is a tremendous glorification of man, a hymn to humanity." The play, it is said, will be translated into English immediately, and it is likely that an adaptation will be produced on the English stage.

✧ ✧ ✧

Mr. W. G. Collingwood has an interesting article in "Good Words" on "Ruskin's Library. Ruskin's books were scattered all over his house, but in his study were kept his books of constant reference and his pet editions. Curiously enough, in that workroom there were few volumes on Art or Political Economy, save two—one an odd volume, mostly uncut, and Viollet le Duc's "Dictionnaire de l'Architecture." Ruskin, says Mr. Collingwood, "came to his own conclusions; he got at the root of the matter, mostly, and he could make you see it. All the tinkering criticism about his mistakes only shows that he thought 'first-hand,' so to say, and wrote with a full pen." Ruskin had one abominable habit—that of cutting down books to fit a shelf. It is almost incredible that he could saw off the top edge and rip out the best plates from so valuable a folio as Westwood's "Miniatures and Ornaments of Anglo-Saxon and Irish MSS." Yet he did it.

✧ ✧ ✧

The difficulties of the compilers of dictionaries are well illustrated in a note in "Notes and Queries," by Dr. Murray, editor of the "New English Dictionary." The word which Dr. Murray discusses is the now too familiar "Appendicitis." Dr. Murray writes:

When the portion of the dictionary dealing with "app-" was written in 1883, we had before us a single reference, from a recent medical source, for this word. As words in "-itis" are not (in origin) English in form, but Græco-Latin, and thus do not come within the scope of an English dictionary, unless, like "bronchitis," they happen to be in English use, I referred our quotation for "appendicitis" to a well-known distinguished medical professor. . . . His answer was that "appendicitis" was a name recently given to a very obscure and rare disease; the term was purely technical or professional, and had even less claim to inclusion in an English dictionary than hundreds of other Latin or Latinised Greek terms of which the medical lexicons are full, and which no one thinks of as English.

Yet, twenty years later, appendicitis appears to be a disease neither rare nor obscure. It is perhaps fortunate that our bodies are reticent concerning their dictionary possibilities.

✧ ✧ ✧

Mr. Dooley does not believe in free libraries. He says in the "New York American": "Libries niver encouraged lithrachoor annymore thin tombstones encourage livin'. No wan iver wrote annything because he was tol' that a hundred years fr'm now his books might be taken down fr'm a shelf in a granite sepulcher an' some wan wud write 'Good' or 'This man is crazy' in th' margin. What lithrachoor needs is fillin' food." In the conversation with his friend Hennessy the following passage occurs:—

"Has Andhrew Carnaygie given ye a libry yet?" asked Mr. Dooley. "Not that I know iv," said Mr. Hennessy. "He will," said Mr. Dooley. "Ye'll not escape him. Before he dies he hopes to crowd a libry on ivry man, woman, an' child in th' counthry. He's given thim to cities, towns, villages, an' whistlin' stations. They're tearin' down gas houses an' poorhouss to put up libries. Before another eyar ivry house in Pittsburg that ain't a blast furnace will be a Carnaygie libry. In some places all th' buildin's is libries. If ye write him f'r an autygraft he sinds ye a libry." Mr. Dooley always has his eyes open; he is a philosopher who gets at things from the inside.

✧ ✧ ✧

The February "Bookman" is an excellent Thackeray number. Mr. G. K. Chesterton supplies the leading essay, in the course of which he propounds the opinion that of all examples of misapprehension, "none is more perfect or amusing than the fashion which called Thackeray a cynic." What, then, was Thackeray? Mr. Chesterton's answer is, of course, interesting and eloquent. His gospel may be summed up as "the philosophy of the beauty and the glory of fools." He believed, like St. Paul, that "God made the foolish things of the world to confound the wise. He looked out with lucent and terrible eyes upon the world, with all its pageants and achievements; he saw men of action, he saw men of genius, he saw heroes; and, amid men of action, men of genius, and heroes he saw with absolute sincerity only one thing worth being—a gentleman. . . . He was a monk who rushed out of the monastery to cry out against a gaudy masquerade that was roaring around it, and ever since his monk's frock has been mistaken for one of the masquerade dresses, and applauded as the best joke in the whole fancy dress ball." All of which is finely said, if it is a little overpowering. It is, at any rate, an overwhelming foil to Ruskin's unpleasant remark that Thackeray settled like a meat-fly on whatever one had for dinner, and made one sick of it.

✧ ✧ ✧

A tragedy entitled "Clytæmnestra," by Arnold F. Graves, with a preface by Robert Y. Tyrrell, Litt.D., D.C.L., has just been published by Messrs Longmans, Green, and Co. "Clytæmnestra" is not a Greek play in English, but a Greek story treated from the standpoint of the modern dramatist. In selecting his theme, Mr. Graves has chosen perhaps the one subject in Greek Tragic Literature which lends itself to such treatment—the "Orestea"—a story dealing with emotions, passions, and situations common to all time, and appealing, not only to mature scholars and lovers of poetry, but to men, young and old, who are interested in dramatic literature and the analysis of human nature. The old Greek tragedy was to a large degree religious: in it moral duties were inculcated, and the denouement was brought about by the gods, who appeared at this critical moment to punish the guilty or reward the innocent. In Mr. Graves' play, on the other hand, the religious interest is subordinated to the human: the gods do not tread the stage; and the chorus, with its religious and moral reflections, is omitted. In this way the author avoids all invidious comparisons with Æschylus, Sophocles, and Euripides, who dramatised the same subject; though he follows their example by introducing fresh matter, and telling his tale so as to suit his own dramatic purposes. The result is a play which cannot be regarded as even an adaptation from any of the older tragedies. The book has been printed and bound in Dublin.

SCIENTIFIC TOPICS.

Another new comet has been discovered by Professor Giacobini of the Nice Observatory. Like the one he discovered at the end of 1902, the newcomer is a telescopic comet, but it is of the tenth magnitude instead of the twelfth. It is now moving slowly through the constellatioi Pisces in a north-easterly direction.

✧ ✧ ✧

George K. Cherrie, curator of the Brooklyn Museum, is away on an expedition into South America in search of specimens of butterflies and mammals. He was acompanied by Benjamin Gault, of Chicago, who will scan the same country in the interest of the Field Columbian Museum for relics of the prehistoric ages.

✧ ✧ ✧

Ira F. Gilmore, of Bloomington, Ill., has perfected and patented a wireless piano which he has been working on for thirteen years. Being unable to get the reed made satisfactorily in the United States, he set about this task himself, and from a piece of steel he fashioned with a drill and file a five-octave comb reed, from which, it is said, combined with a bridge and sounding board, he secures a fine, sharp tone.

✧ ✧ ✧

The greatest and most modern armour plate press in the world has been received at the new works at Homestead. It was bulit at the Bethlehem Steel Works. The plate has a capacity of 60 tons, and is capable of pressing into shape the heaviest plates expected to be specified by the Navy Department. Some of the bolts of the press weigh as much as 40 pounds each.

✧ ✧ ✧

A series of experiments was recently carried out at the Altenburg colliery, near Saarbrucken, Germany, with lime, tar, and carbolineum, to determine the respective value thereof as preservatives of mine timber against rot. Lime was found to be of the least value, while coal tar, although insuring perfect preservation of the surface of the timber, failed to protect the interior, which in every instance, was found to be seriously attacked by rot. Carbolineum, however, gave excellent results, provided the timber coated had been previously barked and well dried.

✧ ✧ ✧

The extensive commercial use of celluloid has caused many people to try to find substitutes for, or imitations of, it. In Coburg, a popular imitation has been made by dissolving in 16 parts—by weight—of glacial acetic acid, 1.8 parts of nitro-cellulose, and adding 5 parts of gelatine. Gentle heating and stirring are necessary. After the mass has swollen, it is mixed with 7.5 parts of alcohol (96 per cent.), and stirring is continued. The resulting product is poured into moulds, or, after further dilution, may be spread in thin layers on glass. As an underlay for sensitive photographic films, the material has important advantages, not the least being that it remains flat in developing

✧ ✧ ✧

An Italian scientist, E. Salvioni, has constructed a balance which makes it possible to weigh very light objects and which on that account he calls a "micro-balance." It consists essentially of a thread of glass four inches long and about as trick as a hair line drawn with a pen of ordinary hardness. This thread is fixed at one end and kept in a horizontal position. The body to be weighed is placed on the other end and the flexure of the thread read off by a micrometer and microscope. With this simple but ingenious device it is possible to weigh as little as the one thousandth part of a milligram or less than one fifty-thousandth of a grain, Troy weight.

✧ ✧ ✧

James Edward Allen Gibbs, the inventor of the sewing machine which bears his name, died recently at his home in Raphine, Rockbridge County, Va. Paralysis was the cause of death. He was born on August 1, 1829. While a young man, the subject of the sewing machine was called to his attention while on a short business trip connected with the erection of some mill machinery which his father had manufactured, and on his return home he thought out the idea of the revolving hook, which is the main feature of the Willcox and Gibbs machine. In all he took out twelve patents covering the sewing machine. The village in which he resided was named by him when he returned to it in middle life. The name is from the Greek word which means "to sew."

✧ ✧ ✧

There are many nights at this season of the year (writes Henry Norris Russell in the "Scientific American") which, though perhaps the most brilliantly clear that we ever have, are practically useless for most astronomical purposes. They are usually marked by a sudden fall in temperature and a high wind, and may always be distinguished at a glance by the conspicuous and violent twinkling of the stars. On looking through a telescope on such a night shows what interferes with observations. The image of a bright star is enlarged into a blurred and unsteady mass, which cannot be brought to a sharp focus. With a larger object—the moon, for instance—the whole area is seen to be "boiling"—that is, trembling like a landscape seen across a broad stretch of hot ground on a summer day—and all but the coarsest details are invisible. In such weather few observations can be made with profit except those of comets and nebulæ, which have no sharp outlines, but, being faint, are best seen on clear nights.

✧ ✧ ✧

The explanation of this "bad seeing" is easy to understand. Every one knows that atmospheric air refracts the light which passes through it just as all other transparent bodies do, though in a relatively small degree. The refractive power of air depends upon its density, which is never quite uniform through any considerable region of our atmosphere, and it is farthest from being so on just such nights as we have described, when different layers of air, unequally cooled, are mixed together by the wind. The rays of light, proceeding from any given star, which reach different parts of the object-glass of a telescope, having passed through portions of air of somewhat different density, will be refracted in slightly different directions. Consequently they cannot all be brought to one sharp focus; and, as the wind carries new streaks of denser or rarer air across the line of sight, the blurred image will dance about and change its form.

✧ ✧ ✧

The twinkling of the stars, as viewed by the naked eye, is due to the same cause. An interesting confirmation of this theory may be obtained by viewing a screen illuminated by the light of Sirius. When one's eyes are sufficiently accustomed to the darkness, it is easy to see—at least on a night when there is much twinkling—that the star's light is not uniform, but that the screen is crossed by vague flickering alternations of light and shade, which are usually in rapid motion. These are "shadows" of the regions of varying density in the air. They move fastest on windy nights, and on calm nights when the air is steady they almost disappear.

✧ ✧ ✧

It should be remarked that it was predicted by Professor Young that a screen illuminated by a twinkling star would show such a phenomenon, many years before the writer succeeded in observing it. Similar flickerings can be observed in the light of a few other stars, but with great difficulty on account of their faintness. It is highly probable that the "shadow bands" seen just before and after total eclipses of the sun are phenomena of the same character. Another observation of some interest, that can be made while studying starlight in this way, is the comparison of a red and a white star. Alpha and Beta Orionis are well suited for the purpose. It will be found that the illumination of the screen produced by Alpha and Orionis is very much fainter than that due to Beta, although the former is now the brighter of the two to direct vision. The reason for this is that, in the case of a very faint light, the eye is sensitive to the green part of the spectrum alone.

✧ ✧ ✧

The second Berliner telephone transmitter patent, No. 463,569, dated November 17, 1891, which was held to be invalid some time ago by Judge Brown in the United States District Court, was on appeal to the United States Court of Appeals declared valid as to metallic electrodes by this court on January 16th last. The case was that of the American Bell Telephone Company against the National Telephone Manufacturing Company and others for the infringement of the patent. The opinion was written by Judge Colt, and was concurred in by Judges Putnam and Aldrich. It holds that Berliner was not entitled either to the credit of the advantages to be derived from the employment of a carbon electrode in telephone transmitters or to the discovery of microphonic action; that the former was discovered by Edison, and that Professor Hughes is entitled to the credit of the latter discovery, which is the principle utilised in every practical battery transmitter, and that Professor Hughes embodied his discovery in an instrument which he was the first to term a microphone.

✧ ✧ ✧

The Court further found that Edison's discovery of the carbon electrode and Hughes' discovery of microphonic action solved the problem of a variable-resistance transmitter, whereby speech may be transmitted long distances; and that both these discoveries were embodied in the defendants' transmitters. The Court further found that claims 1 and 2 of the Berliner patent in suit, although upon their face open to the objection of excessive breadth, may be sustained when read in connection with the specification, provided they are limited to metallic electrodes, but that when so limited the defendants' transmitters do not infringe. For these reasons the Court held that the decree of the Circuit Court must be affirmed on the ground of non-infringement. Under this decision, as heretofore, since Judge Brown's decision, the free use of variable-resistance carbon transmitters may be continued.

✧ ✧ ✧

Severe and successful tests were recently made by the Fire Department in New York city of the 6-inch standpipe in the new "Flat-iron" building in New York. The purpose of the test was to determine if the 6-inch pipe would stand the great pressure of twenty-three stories of water, and to find out how much force could be given to a stream from a hose attached to a standpipe at so great an altitude. Were there no standpipe, the upper stories of the building would be practically unprotected from fire. Two tests were made: First a 1⅛-inch nozzle was attached to a 3-inch hose on the roof, and the hose to the standpipe. The roof of the building is 304 feet above the street level. After the connections had been made, the full force of a fire engine in the street was turned on; in two seconds a strong stream spurted from the nozzle on the roof. A guage showed that there was a nozzle pressure of 120 pounds even at that great elevation. The second trial consisted in playing nine streams of water, one from each of the eight floors above the twelfth storey and one from the roof; ¾-inch nozzles were used; a pressure of 200 pounds was obtained upon each. The Chief of the Fire Department of New York considers the test eminently satisfactory.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

DUBLIN, MONDAY, SEPTEMBER 17.

Mr. W. Rawson, of Bumelin, observing a few days ago an man that answered the description of Thomas Flanagan, who committed a robbery lately in the offices of Mr. Abbot, of Drumcondra, attempted to secure him, but the fellow perceiving it fled; Mr. Rawson, with a spirit that does him honour, pursued him, and with much difficulty (the villain having wounded him with a reaping-hook), took him, and lodged him in Kilmainham Gaol. It is thought this fellow has been guilty of many felonies.

A strong and convenient wooden bridge has just been constructed across the Dargle river, for the accommodation of the public, near Tinnehinch, at the sole expense of the Right Hon. Henry Grattan.

It is a wrong idea to imagine that there is any combination existing to keep up the price of wool in this kingdom; the great price it bears arises from a real scarcity of the raw material. That manufacture which goes under the denomination of common blankets, were sold about two years since at 2s. 4d. per yard, but have since arisen to 3s. 10d. and 4s. Those called second fines, which were formerly sold at 3s. 6d., are now risen to 5s., and the very finer sorts proportionately dear. Such are the Kilkenny prices, comprehending a rise of 6s. the pair, and blankets of the coarse sort, plaids, and flannels, have been raised 6d. in the yard.

Wednesday evening, between seven and eight o'clock, no less than six persons were robbed on the Lucan road, by a gang of villains who infest that neighbourhood; and same night, about ten o'clock, two countrymen were stopped near Island Bridge, by four fellows armed with pistols, who robbed them of a guinea and seven shillings.

BELFAST, SEPTEMBER 20.

Nautical experiments, we are happy to find, are not confined solely to London or Dublin, for on yesterday the Lough of Belfast presented to a vast number of spectators one of the best sailing matches we remember to have seen—whether we consider the manœuvres of the different boats, or the practical knowledge each seemed to be master of in conducting them through the mazy windings of our intricate lough—the race was between a boat belonging to the ship "Margaret," Capt. M'Kibbin, and a pilot-boat of Mr. M'Clean's. They started from the quay, and went as far as Garmoile, from whence they returned at half-past three, after displaying a variety of racks. The ship's boat, being the smallest, arrived first; the other was eight minutes behind, and it was generally supposed would have won had there been a smart breeze.

DUBLIN, MONDAY, SEPTEMBER 24.

The turf trade is again beginning upon the Canal; great quantities are daily selling at the Canal harbour, and we are assured that there are no less than 30,000 kishes at present made in the bogs, and intended for the Dublin market. This will be a substitute for at least £20,000 worth of foreign coals, and furnishes one proof of the advantages to the public from inland navigation.

We are informed that larger orders for beef and pork have lately arrived from France and Spain than have perhaps been known, previous to the slaughtering season, for many years past. Whether this may be occasioned by the apprehension of an approaching war, or any other particular cause, cannot as yet be determined.

To prevent imposition in the coal trade as much as possible, the Guild of Merchants have directed that all coal measures used in Dublin shall be sealed and supplied by the water-bailiffs, who are to be accountable for any mistakes that may happen in the size of those measures; heretofore nearly one half of the coal measures were supplied by coal-sellers and others, many of which were seized and condemned. The Guild of Merchants have appointed a standing committee to hear and determine complaints against master porters.

Mr. Geoghegan, upon whose property in the county Galway the depredations were lately committed, is an honorary member of the Dublin Society, and for his zeal in contributing to the utmost of his power to promote the prosperity of the kingdom, for having by his perseverance rendered the extensive territory of Connemara accessible by land, and for his suggestions of improvement in the art of agriculture, has been publicly returned the thanks of that most useful and patriotic body. It is, therefore, peculiarly incumbent on the magistrates and gentlemen of that neighbourhood to exert themselves, in order to procure a restoration of that property which has been licentiously torn from a praiseworthy individual, in contempt of all law and civilisation.

On Friday night last some villains broke open the warehouse of Robert Shaw, Esq., Fleet street, and carried off two chests full of plate.

A sloop from Dunleary, laden with stones for the works carrying on at the South-wall, was in the storm of Friday morning last, sunk off the Lighthouse, but the hands were providentially saved.

The trade upon the Canal having been much impeded in the late summer for want of a sufficiency of water, the Canal Company have resolved to bring in additional supplies to the summit level, from the springs of Rathbride, Pollardstown, and Morristown river; to effect this they have purchased the Armsborough Mills at Rathangan, and have issued a commission for valuing the other mills and lands to be purchased on this occasion, early in the next month. The Canal is full at present, and in no danger of wanting water without addition to the present supplies until the next spring, be the trade ever so extensive; and, in the meantime, these additional supplies will be brought in. The amount of these springs, measured in the driest season, was 96 locks full in 24 hours, which added to the present supplies may be considered inexhaustible; but should the trade be so extensive as to require additions, the Company can at the same place make a reservoir covering 340 acres, eight feet and a half deep, and containing upwards of 30,000 locks full. These are resources which as no other Canal in the three kingdoms can boast of, and will insure to the public permanency, in the great advantages of inland navigation.

The following advertisement appeared in "The Dublin Chronicle," September 22-25, 1787:—

"General Post Office, Dublin,
"September 17th, 1787.

"Whereas the Postboy bringing his Majesty's Mail of Letters from Cork for Dublin, which was despatched from Cork on Saturday Morning last, the 15th inst., was stopped and robbed about Eight o'Clock that Evening, nearly half-way between Lismore and Clonmel, by a single Highwayman, who tied the Postboy's Hands behind his Back, and tied a Handkerchief on his Face, while he cut open the Cork Mail, and took with him all the Cork Letters for and by way of Dublin, and those for and by way of Waterford; also, the entire Post-bag from Youghall for Dublin, with which he rode back towards Cork.

"The Postboy describes the Robber to be a lusty Man, of genteel Appearance, wore a light-coloured Surtoat Coat, and Rode with Pistols in Furniture.

"Notice is hereby given, that whoever shall apprehend and convict, or cause to be apprehended or convicted, the Person who committed said Robbery, will be entitled to a Reward of TWO HUNDRED POUNDS; or, if any Person, whether an Accomplice in the said Robbery, or knowing thereof, shall make Discovery, whereby the Person who committed the same may be apprehended and convicted, such Discoverer will, upon such Conviction, be entitled to said Reward of Two Hundred Pounds.

"By Order of His Majesty's Postmasters General,
"Dublin Castle, September 17, 1787.
"JOHN LEES, Secretary.

"His Grace the Lord Lieutenant, for the better discovering and bringing to Justice the Person or Persons concerned in the abovementioned Robbery, is pleased hereby to promise His Majesty's free Pardon to any one of them (except the Person who actually robbed the said Mail) who shall first discover his Accomplice or Accomplices, so that they, or any of them, be apprehended and convicted thereof.

"By His Grace's Command,
"S. HAMILTON."

The following advertisement appeared in the succeeding issue:—

"General Post Office, Dublin,
"September 22nd, 1787.

"Whereas the Postboy conveying His Majesty's Mail of Letters despatched from this Office last Night, was stopped at the eight-Mile Stone, on the Balbriggan Road, about the Hour of One o'clock this Morning, by a single Robber, who robbed the Mail of the Letters for the following Towns:—Derry, Strabane, Omagh, Armagh, Loughbrickland, Lisburn, Newry, Dundalk, Dromore, Carrickmacross, Monaghan, Balbriggan, Lurgangreen, Drogheda, and Flurrybridge.

"The Postboy describes the Robber to be a middle-sized Man, wore a White Coat, reddish Waistcoat, long Trowsers, round Hat, short Hair, and spoke with a singular Accent; and says, that while he was taking the Letters, he was spoken to by an Accomplice, who was in the Field, who he desired to stand off, as there was no occasion for him.

"Dublin Castle, September 17, 1787.

"Notice is hereby given, that whoever shall apprehend and convict, or cause to be apprehended or convicted, the Person who committed said Robbery, will be entitled to a Reward of TWO HUNDRED POUNDS; or, if any Person, whether an Accomplice in the said Robbery, or knowing thereof, shall make Discovery, whereby the Person who committed the same may be apprehended and convicted, such Discoverer will, upon such Conviction, be entitled to said Reward of Two Hundred Pounds.

"By Order of His Majesty's Postmasters General,
"JOHN LEES, Secretary.

"Dublin Castle, September 17, 1787.

"His Grace the Lord Lieutenant, for the better discovering and bringing to Justice the Person or Persons concerned in the abovementioned Robbery, is pleased hereby to promise His Majesty's free Pardon to any one of them (except the Person who actually robbed the said Mail) who shall first discover his Accomplice or Accomplices, so that they, or any of them, be apprehended and convicted thereof.

"By His Grace's Command,
"S. HAMILTON."

ENNISCORTHY CASTLE, CO. WEXFORD.

FROM AN EIGHTEENTH CENTURY DRAWING BY BARRALET IN THE COLLECTION OF THE RIGHT HON. WILLIAM CONYNGHAM.

Ancient Boroughs of Ireland

HISTORY OF THE OLD IRISH BOROUGH.

From Lewis's "Topographical Dictionary of Ireland," 1837.

ENNISCORTHY, a corporate, market, and post-town, and a parish (called St. Mary's, Enniscorthy), in the barony of Scarawalsh, county of Wexford, and province of Leinster, $11\frac{3}{4}$ miles (N.) from Wexford, and $62\frac{3}{4}$ (S. by W.) from Dublin, on the river Slaney, and on the road from Wexford to Dublin. This place probably derives its name from a beautiful island in the bed of the Slaney, which here divides that river into two channels. It is said by Seaward to have been originally the capital of the "Coriondi," and by other writers to have been called "Corthae," and subsequently given as a portion to Basilea, sister of Strongbow, on her marriage with Raymond Le Gros, to whom is attributed the erection of its ancient castle. In 1227 the town was surrendered by Philip de Prendergast to the Bishop of Ferns, who asserted a superior claim; and in 1231 it was confirmed to that prelate by Gerald de Prendergast, the son of Philip, to whom the Bishop restored it in exchange for other lands, on condition of his holding it under the see. The castle and manor afterwards came into the possession of the M'Murroughs, or Kavanagh's, and were granted by Donald, surnamed Fuscus, to the Franciscan monastery which he had founded, after the dissolution of which they were given by Queen Elizabeth to John Travers, who conveyed them for a term of years to the poet Spenser, by whom they were assigned to Sir Henry Wallop, Knt., ancestor of the Earl of Portsmouth. In 1649, the town and castle were taken by Cromwell, and soon after became the property of an ancestor of the

Carew family, but were subsequently restored to the Wallop family, in exchange for other lands, by Robt. Carew, Esq. In 1798 this place was the scene of mush hostility: the town, which was garrisoned by 300 of the King's troops, and by several corps of yeomanry, both horse and foot, was attacked on the 28th of May by nearly 7,000 of the insurgent forces, who, after a sanguinary conflict, compelled the garrison to retreat to the market-place, where, making a resolute stand, they ultimately repulsed the assailants. But the town being on fire in several places, and surrounded by an overwhelming number of the insurgents, the King's forces retreated to Wexford, and the enemy plundered the town, damaged the interior of the church, and converted the castle into a prison. On the 29th, the insurgents took their station on Vinegar Hill, an adjoining eminence, where, being joined by the disaffected from th surrounding country, the numbers increased to upwards of 10,000 men. Many of the loyal inhabitants of the town, who had not been able to escape with the garrison to Wexford, were brought prisoners to the insurgents' camp, tried by a court martial, and put to death. Gen. Johnson, with a party of the royal forces, succeeded in making himself master of the town; and on the 21st of June, Gen. Lake, commander-in-chief of the royal army, attacked the insurgents in their camp and routed them. The enemy fled with precipitation towards Wexford, leaving behind them great numbers of slain and thirteen pieces of ordnance.

The town is built on the acclivities of the hills on both sides of the Slaney; the streets are in general narrow, and in some parts inconveniently steep for carriages. By the charter of incorporation granted by Jas. I., in the 11th of his reign, the government is vested in a portreeve, 12 free burgesses, and a commonalty, assisted by a recorder, town, clerk, two serjeants-at-mace, and other officers. The borough returned two members to the Irish Parliament till the Union, when it was disfranchised, and the £15,000 awarded in compensation was paid to Cornelius, Lord Lismore, and Robert Cornwall, Esq.: to the former £12,300, and to the latter £2,700.

The ancient castle, now the property of the Earl of Portsmouth, is a venerable quadrilateral building with a round tower at each angle, and is surrounded with a high wall of more modern date. Of the Franciscan monastery, the only remains are a lofty square tower on four pointed arches, a great portion of the conventual buildings having been removed in order to furnish a site for the new market; a curious brooch of gold, enriched with emeralds and garnets, was found in clearing away the ruins. About three quarters of a mile below the town, on the west bank of the Slaney, and in the parish of St. John, was a monastery for canons regular of the Order of St. Victor, founded by Gerald de Prendergast, in 1230, and subsequently made a cell to the abbey of St. Thomas-juxta-Dublin, by John St. John, Bishop of Ferns, on which occasion it adopted the Order of St. Augustine.

EXCAVATIONS AT CORINTH.

By PAUL ELSNER, ATHENS.

Of the high mountains which border the Gulf of Corinth none has so beautiful and bold an outline as the inaccessible rocky pyramid of Acro-Corinth, which is crowned by a ruined fortification, at one time of the utmost strategic importance. With an air of command it looks down upon the palaces and towers, on the multitude of temples flooded with a halo of blinding sunlight from the glowing Greek skies, and upon the wealth of monuments, which mark the ancient city, once covering with bewildering glory the enormous "emporium," which, with an area of 20 kilometres, slopes gradually from the foot of the Acropolis to the shore of the sun-bathed sea. After a long epoch of highest culture, beginning about 800 B. C., the fall of Rome brought destruction upon this community, at that time permeated by the spirit of commercialism. For fully a century the weeds grew undisturbed in the streets of the city, which the Roman Consul Lucius Mummius destroyed 146 B. C. Cæsar rebuilt the city and during the height of the Roman Empire it attained a pinnacle of unwonted glory as a cosmopolitan trade centre. Mighty waves of Goths and Slavs swept over it and proved destructive to its wealth and position; then under the alternating dominion of the Frank, the Turk and the Venetian this splendid centre of culture finally disappeared altogether. Deeper and deeper grew the strata of earth which were layered upon the ruins of the city, stirred only now and again by the plough of the farmer.

To the later period of flourishing culture of the city, in ancient times, only a few pillars of a Doric temple bear pathetic testimony; these pillars are shaded by the high cypresses within the purlieus of the modern village called "Old-Corinth." When the American Archæological Institute in Athens began the large scientific enterprise of the systematic examination of this extensive site of Corinth under the leadership of its director, the eminent archæologist, Dr. Rufus Richardson, in the year 1896, it faced serious difficulties. For even the ancient temple, which in the course of the excavations was entirely exposed and definitely recognised as the Sanctuary of Apollo, furnished no valid clue to the topography of Corinth; and yet the excavations, interrupted only by the Græco-Turkish war of 1897, secured for the fortunate seekers a series of successes.

At the very beginning of the first effort the spade struck the ruins of a theatre of the Roman period built immediately above an older Greek theatre. It was found at a depth of about 15 or 20 feet and had been surrounded by a laurel grove. Its slumber of centuries duration "in the secret recesses of earth's deeps" had been disturbed only by a number of trenches, which now furnish an intelligent plan of its construction.

Three water-courses were also unearthed; the celebrated spring of flowing water called Peirene, walled up during the Roman period; a second spring disturbed by an earthquake, which lies between the theatre and the Temple of Apollo, at the foot of the hill crowned by the latter; and finally the old city fountain of Corinth. Time has dealt so kindly with this venerable structure, a fountain surmounted by a Poseidon with dolphins at his feet, that it is the best preserved type of any Greek water-course hitherto excavated. The fountain was enclosed in the time of the Romans by a balustrade, 30 metres in length, shimmering in red, blue and yellow colours. The sheen of the wealth of colour is as resplendent to-day as it was in the olden days, when the women and maids of Corinth gracefully bore their earthen jars to the melodious fountain to be filled. This resplendent balustrade is a most instructive example of the polychrome process used in Greek structures.

Further excavations of a part of a marble staircase which led from the propyla downward to the wharves and to the Agora (market-place) indicate clearly the contours of the topography of Corinth.

Furthermore, the spade disclosed by successive steps in a westerly direction all the structural appurtenances of the propylon, so that this triumphal arch formerly frowning down upon the city, could now be easily reconstructed. There are to be considered in this connection two colossal figures of Phrygians, dating back to the first or second century of the Christian era. Connected with the right and left pillar of the propylon, they bore the Corinthian capitals and the architrave of the triumphal arch, which have also been found. The features of the one colossal figure, 2,000 years old (found inverted in the soil), were fully preserved; in the other, the nose, formed of a separate piece, has been inserted. In the neighbourhood of their bases, which are ornamented in relief, there were found two female heads, more than life size, whose imposing beauty materially heightened the majestic impression of the propylon. The last finds of relief-representations of Helios and Selene furnish the last link in the series of structural parts of the propylon.

Of the rich statuary discovered, only the following can be mentioned here; a life-size head of Ariadne, a relief of two almost life-size dancing girls, with classically beautiful drapery of the garments, dating back to the Roman period, and a small Greek votive-tablet, representing seven gracefully grouped figures artistically finished.

Science has been presented with valuable additions by these relics of vanished ages, for which it is indebted to the American Archæological Institute.

TRAPPING ERMINE.

The colder the climate the finer the fur, says the author of "The Greatest Fur Company of the World," in "Frank Leslie's Magazine," and the difficulties of obtaining the rare furs are many. Ermine is at its best when the cold is most intense, the tawny weasel coat turning from fawn to yellow, from yellow to cream, and then to snow-white, according to the latitude and the season.

Fox, lynx, marten, otter, and bear the trapper can take with steel traps of a size varying with the game, or even with the clumsy but efficient deadfall; but the ermine, the fur of which is as easily damaged as the finest gauze, must be handled differently.

The hunter, going the rounds of his traps, has noted curious tiny tracks like the dots and dashes of the telegraphic alphabet. Here are little prints slurring into one another in a dash; there, a dead stop, where the quick-eared stoat has paused with beady eyes alert for snowbird or rabbit. Here, again, a clear blank on the snow, where the crafty little forager has dived below the light surface and wriggled forward like a snake to dart up with a plunge of his fangs into the heart-blood of the unwary snow-hunting.

From the length of the leaps the trapper judges the age of the ermine. The full-grown ermine has hair too coarse to be damaged by a snare. If, therefore, the tracks indicate a full-grown animal, the trapper suspends the loose of a looped twine or wire across the runway from a bent twig, which, when, released, springs upwards with a jerk that lifts the ermine off the ground and strangles it.

If the tracks are like the prints of a baby's fingers, close and small, the trapper hopes to capture a pelt fit for a throne cloak. Perfect fur would be marked by the twine snare, so the trapper devises as cunning a death for the ermine as the ermine devises when it darts up through the snow and fixes its spear-like teeth in the throat of a rabbit.

First he smears his hunting-knife with grease, then he lays it across the track. The little ermine comes trotting in dots and dashes, and gallops and dives to the knife. The knife is frosted like ice. Ice the ermine has licked, so he licks the knife. But alas for the resemblance between ice and steel! Ice turns to water under the warm tongue; steel turns to fire that blisters and holds the foolish little stoat by his inquisitive tongue, a hopeless prisoner, until the trapper comes.

OLD DUBLIN.

ITS HISTORY, CHARACTERISTICS, & MANNERS.

By LADY MORGAN.

II.

Still, however, even in the reign of Elizabeth, and down to that of her successor, James, with the exception of the "fair houses" and castles built of stone and lime, by the lords of the Pale, and the ecclesiastical palaces raised by the wealthy Church, the city of St. Patrick's prophesy and promise made but little progress in architectural splendour.

The hovels of mud and wattles were, indeed, exchanged for houses of cage-work and timber, and covered with tiles and shingles. But the arts of peace, an unshackled commerce, the protection of the laws, and above all, an equal distribution of justice, religious tolerance, and national unity, the source of all social improvement, and the basis of solid settlements, commodious and permanent dwellings, were still withheld from that unhappy country, for which no truce from suffering had yet existed. The burghers of the capital were in perpetual conflict with the bordering enemies (11), or in resistance to the encroachments of the Church on personal property.

The mass of the natives without the Pale, carring, flitting, fighting, shifting, hiding, pursuing or pursued, now pouring down upon the capital from their mountains in their neighbourhood, now beaten back to their impervious wildness (their only fortress and security), now taking "Irish leave" and bravely attacking their oppressors, now "coming in," falling on their knees, at the feet of the representers of English Sovereigns—the mass of the natives were thus kept at bay from all social improvement, and were thrown beyond the pale of civilised and commodious existence, as they were placed beyond the political boundary of good laws and wise government. (12)

If in the reign of Charles the First (13) the citizens of Dublin began to exhibit some improvement in architecture and accommodation, still the rebellion of 1641, the civil wars of the Commonwealth, the struggles of the houses of Stuart and Orange, and above all, the worse than all, the ferocious penal codes and paralysing statutes of Queen Anne and the two first Georges, produced the same effect on the material and physical aspect of the capital and country, as on the moral, social, and political existence of the people. In all its bearings civilisation was retarded; and in the early part of the eighteenth century Dublin was one of the most dilapidated, antiquated, and least commodious cities in Europe. It was, indeed, the reverse of that modish and well-worn figure of an oasis in a desert; it was a piggery in a paradise. Embosomed in picturesque mountains and luxuriant woods, watered by a noble river, and commanding its own magnificent bay, still it looked like some City of the Plague of Asiatic climes, where Nature and man are ever at variance.

The narrow lanes, shut-up closes, and pent-in courts, were calculated only to nourish disease and perpetuate infection. Even towards the middle of the eighteenth century, when the slow dropping off of one penal infliction after another gave some free breathing to the natural energies of the country, and permitted some effort at improvement in the wretched people, Dublin, with the exception of a few well laid out and spacious streets, had made such little progress, in spite of the prophecy of St. Patrick, that it was compared by a veracious and impartial traveller of that time, to "the worst part of St. Giles's in London," (14) its street ill-paved, and worse lighted, its raised flags few, and incumbered with bulks, its quays but partially banked in, its police neglected, and filth everywhere accumulated, rendered the ways impassable, and the air noxious.

The causes which had so long weighed down upon the material and moral improvement of the metropolis, were still more disgustingly obvious on the majority of its population. The lower classes, that crawled forth from their dens and alleys, (15) exhibited the most painful appearance; and at that early period of the day when the wealthy and luxurious had not yet issued forth to chequer the general wretchedness with images of wealth and splendour, it would have seemed to a stranger's eye, as if all the prisons and lazar-houses of the realm had emptied their cells and wards into the filthy avenues of the Irish capital. From two to three thousand professed mendicants then daily swarmed forth, with malady stamped on their squalid visages, while want or vice, famine or inebriety, (16) maddened them into vociferous cravings, or blasphemous imprecations. Thronging more particularly round the doors of the Catholic gentry (whose mistaken charity, in this instance, has ever served to perpetuate street beggary), they impeded the threshold of business, infected the avenues of pleasure, and presented one of the most fearful and obvious results of that fatal policy, which reduced the nation to a state vibrating between the extremes of a debasing mendicity and a vicious and overwhelming opulence.

A step above this unhappy order in caste, though differing from it but little in appearance, stood at the corner of every street and court incorporated groups of professed humourists, the conservators of that wit which is supposed to be the indigenous produce of the soil, who, scattering about in prodigal profusion lamp-black and lampoons, and who, steeped to the eyes in mud and merriment, obtained no small celebrity among the genuine lovers of low but racy humour, by the style and title of his majesty's black-guards, or the company of shoe-blacks.

Like the Forts de la Halle of Paris, the shoe-blacks of Dublin went for something in every city ceremony; and the names of two of their chiefs (17) are scarcely yet obliterated from the Fasti Dublinienses of wit and humour. Superior in grade to all others of the street population of Dublin (in the middle of the last century), and eminently influential in their vocation, were the hawkers of fly-sheets, or news criers, (18) who like the colporteurs of Paris of the same day, crowded the steps of every public building, "les nouvelles a la main," and slily circulated publications, which by being placed on the "Index Expurgatorius" of the constituted authorities of the day, no regular bookseller or printer would venture to vend. The fate of George Faulkner had produced a general intimidation at an epoch when the liberty of the Press in Ireland was, like all other liberty, in abeyance; and this order of men, whose cries rendered the streets of Dublin noisy as those of Naples, and whose verbal eulogium of their literary and political ware, might have rivalled the art of puffing, as practised by the first-rate London booksellers of modern times—this class, if not founded, was at least reformed, and regularly and systematically organised, by that idol of all the lower classes of the Irish, Dean Swift. (19) He, who wrote for the common people, wisely made use of the cheapest mediums for distributing productions beneficial to the country at large,

(11) The septs of the O'Burnes, O'Tooles, and Archibalds. The citizens of Dublin had not only to stand on the defensive against the Church, for their own cause, but frequently to fight for the holy order against another. In 1506 the prior of Kilmainham attempted forcibly to take some loads of hay from the Dominicans of Dublin, but the Mayor and commoners assembling together in favour of the priors, rescued the hay and drove the prior into Kilmainham. "The abbot of St. Thomas and the citizens of Dublin were perpetually at fisty-cuffs about a toll-booth; but the church had its revenge, for a citizen having shot a random arrow, struck the image in the rood-loft of St. Patrick's, during a riot in the church between the Kildares and the Ormonds; the Pope duly absolved them by the penance of the mayor and corporation, who in detestation of the feat, ordered to keep up the memory of it for ever, were to walk barefooted through the city in procession before the sacrament of Corpus-Christi day early."

(12) Whenever the citizens of Dublin who in their corporate capacity were always devoted to the dominant interest) had nothing else to do, they went out a "hosting" against their country neighbours, headed by some lord of the pale, or lord deputy, and pillaged, burnt, and spoiled all before them. Thus in 1505, "The mayor of Dublin, with Walter Pepar and Maurice Colton, bailiffs, marched out at the command of the Earl of Kildare, Lord Deputy, to Ballaghasped, against Carroll, whom they harassed and destroyed, and then returned to Dublin." The unfortunate borderers occasionally made reprisals, and the septs of the O'Burnes and the O'Tooles invading the Pale forts of Fassagarde and Bathcool, struck terror into the citizens of Dublin, "as well by their number, as their policies in laying ambushes in and down the woods of Glendolary, on the south side of the city of Dublin."

(13) In the reign of Charles the First, gardens, spaces of ground, and thatched houses, were to be seen within the narrow compass of the walls of Dublin.

(14) "You may conceive what the style of building was here formerly, when I tell you that the mansion house of the Lord Mayor is a brick house of two stories with windows of but two panes breadth in each."—"Philosophical Survey of Ireland, 1775." At this time, with the exception of Leinster and Charlemont House, both then recently finished, there were but two or three houses of hewn stone in Dublin; and Dr. Campbell observes, that "almost all the tolerable houses and streets have been built within forty years"; say from the year 1735 to 1775.

(15) A sort of bird's eye view may always be taken of the moral state of a country by the appearances of the street population, and the lower orders. "I cannot describe to you," says Dr. Campbell, "how much I was hurt by the nastiness of the streets (Dublin) and by the squalid appearance of the canaille: the vast inferiorities of the lower ranks in Dublin compared even with those of the country towns of England is very striking. Seldom do they shave, and when they do, it is but to unmask the traces of meagreness and ferocity. Here, to be sure, you meet some splendid equipages, and a large suite of lackeys after a Sedan chair; and you frequently meet faces fair enough to make Circassia gaze; but all these scarcely compensate for the painful sensations produced by the general mass." What a picture!—drawn, too, from the life. Such were the results of the penal lash in the middle and towards the close of the eighteenth century.

(16) The Government have always sacrificed the health and morals of the lower orders in Ireland to the supposed interests of the Exchequer. In 1685 Sir William Petty relates that in Dublin, "where there are but four thousand families, there are 1,271 alehouses and brewhouses."

(17) Waddy and Paddy Oughy's frequent pitting against each other "the keen encounter of their wits," finally led to an encounter in which Waddy fell by the hand of Oughy, who suffered in consequence the penalty of the laws.

(15) The hawkers of news and cleaners of shoes fill up the measure of the apparent poverty in Dublin. The filth of their bodies is offensive, their manners shocking, their outrages upon decency disgusting, and their several cries, infinitely more sonorous than the English, tingle in the ears with all the enraging variations of the brogue."—Campbell.

(19) Like all genuine Irish patriots Swift was too indignant, too mortified at the state of Ireland, and the submissive degradation of her sons, to flatter her: he did more—he wrote for her, served her, enlightened her; and that at the moment when, in the irritation of disappointed patriotism, he was wont to exclaim, "I am not of this vile country."

and calculated to go home to men's hearts and businesses of whatever class or rank. The "Drapier's Letters" were cried and sold by the hawkers of Dublin at a penny a-piece; everyone who could read, read the "Drapier's Letters," and those who could not, paused in the highways and public places to listen to their abrege, tolled out humorously in the slang brogue of Dublin by the criers and hawkers, who distributed them not only through the streets of the metropolis, but through the kingdom, where they were to be seen in all houses and cabins pasted against the walls, with "Don Belliamis of Greece," "The seven wise Maesters," "Black-eyed Susan," and "The last speeches and dying declarations of those who trusted they had not sin'd in vain." (20) It was the writings of Swift and Molyneux (whose politics were less revered by the Irish than the morality of Confucius by the Chinese) that first dispelled the dense cloud that hung upon the national mind by the gloomy overshadowing of the penal laws. The first let in some gleam of illumination upon the dark and brooding spirit of the nation, long steeped in the inertness of hopeless despondency. It was in vain that the book of Molyneux was burnt by the hands of the common hangman in Dublin, and that the Dean of St. Patrick's was punished in the incarcerated person of his devoted and patriotic bookseller: the disciples of these two illustrious patriots and of their doctrines increased (as in cases of all martyrdom) by perseverance; and, while the Dublin hawkers cried and sold their works, the minds even of the lowest and most degraded were enlightened, "sans s'en douter," and the national intellect was prepared to receive those seeds of freedom which burst into such vigorous blow in after-times, and led to the Irish hegira, the glorious and immortal 1782. In the middle of the last century even the most trading streets of a capital which possesses one of the finest ports in Europe exhibited but few images to cheer the eye, or exhilarate the heart; while penal disability, like an incubus, hovered over all. The little movement visible, even in the most commercial avenues, was like the drowsy rotation of some wheel of a ponderous machine, when the power that impelled it had ceased to act. In contrast to the general poverty and dreariness of the scene, the aristocratic part of the city glittered in all the clinquant of exterior splendour with which bad institutions ever seek to hide their inherent defects—Viceroys, in more than royal state, went to and fro, not only to open and to close Parliaments, but to feasts of public ceremony or private conviviality, with all the ensigns of office, and all the protection of an armed force. Peers and commoners in the full dress of the times perpetually drove from the Senate House to the Castle—(those markets of political corruption, where an English Viceroy had always the means of purchasing, and an Irish aristocrat always something to sell;) and city processions were zealously paraded through the streets to show the statute loyalty of the assistants: while incorporated ignorance, pranked out in all the fantastic drapery of "companies" and "bodies," perpetuated many an old papistical ceremony, unconscious of their meaning; and proudly rode the fringes (or franchises) which represented the freedom of the city, when the liberties of the nation lay prostrate in the dust.

The showy and cumbrous equipages of the always ostentatious Irish nobility then vied, and frequently surpassed the more elegant "set-outs" of the English officials; and multitudes of noddies (the Irish cabriolets) and countless sedan-chairs, (21) (for none of either sex then walked, save those who had no means to pay for being carried), contributed to give factitious elegance to a state of society and a capital from which all the true sources of national happiness and national prosperity were withheld. In a word, the metropolis of Ireland at this period resembled in its diminished scale the capital of France of the same era—the squalid misery of the lower classes, and the taste and splendour of the higher, were opposed in strong and fearful relief. While palaces now began to rise on every side, with the power of that overweening oligarchy for whom they were elected, and by whom at no distant day they were destined to be abandoned; there still remained, in the more ancient part of Dublin, some curious relics of the cage-work architecture of the old times, which were so well put together that they long survived the more stately edifices which had been built round them. (22). They still encumbered the neighbourhood of the Swifts and the Stellas; (23) they were to be found in these remote old up and down hill streets, now abandoned to the indigent and the lowly, but once distinguished as the avenues to the "Abbey of the White Friars," and to the hostel called, par excellence, the "Wine-tavern," and led antiquarian steps to "Big-butter-lane," or "Gillemoholmock's alley," in search of the authenticated residence of the gallant Sir Francis Willoughby, of Charles the First's time, or to the site of the domicile of old Dermott Fitz Gillemoholmock, a burgher of Dublin, and a stout ally of King John's.

Dick's coffee-house, in Skinner's row, the resort of the legal and the mercantile, was still kept in an old cage-work house called the Carberie (24), once the residence of the Geraldines, where the most powerful of the Kildares "suffered the Lord Skiffington to dance attendance among the suitors"; and Lucas's, occupying a part of Cork-house, within the purlieus of the Castle, was the daily resort of the wits, politicians, and dramatic critics of the day, who sipped their chocolate or their coffee in rooms where the Burlingtons and the Orrerys had held their statesmen circles and scientific coteries.

It was, however, from the memorable epochs of 1779 and 1782 (when some acquisitions were made by the long-oppressed Irish, by a partial amelioration of the terrific penal code) that the ancient capital of the country first acquired some of the features of the metropolis of a free people; for it is one of the fatal results of a bad Government, that the comforts' accommodations, and health of the community at large are ever sacrificed to the enjoyments, pleasures, and boundless indulgences of the privileged classes, and that the cities of despots are composed of palaces and dens, of spacious courts and luxurious gardens for the great, and noisome alleys and pestilential passages for the lowly! The filthy courts and noxious lanes of Dublin now gave way to spacious streets and healthful avenues, where the air of heaven was permitted to circulate, and its light to shine and cheer. Infection now lost some of its strongest holds, and plague and pestilence began to retreat before the commissioners of wide streets, as toads and serpents fled before the thrice-blessed crozier of St. Patrick.

Commerce, too, recovering from the palsying effects of jealous and impolitic restrictions, called upon the industry of the land; and wealth and confidence gave rise to vigorous speculation, reflecting upon the material as upon the moral aspect of the country. Edifices in the best taste, at once noble and simple, were erected for public utility by public spirit. As the gloomy pile of penal disabilities fell in part (and, alas! but in part), the capital of Ireland, which it had so long overshadowed with its baneful influence, cheered into beauty and spread into capaciousness, and the city of mud and wicker of the days of domestic and foreign despotism, in times of increasing liberality and illumination, became comparatively a city of marble." It did not, however, become so by the ostentation of some Imperial Augustus, but by the partial abolition of bad laws, and the operation of good, for the progress of Irish prosperity has ever kept pace with the decline of intolerance; and those who know her interests best, and love her most, are well aware that nothing but the total abolition of her dark, fearful, and atrocious code can restore her to peace, to confidence, and to the full benefit of those advantages with which Nature has bounteously endowed her.

[THE END.]

(20 Dr. Campbell makes a fearful addition to this picture of the lower orders of Dublin in the middle of the eighteenth century, when the penal statutes were in their fullest vigour, and ere one link had been knocked off the chain of enslaved Catholics. He describes bands of female harpies, covered with tattered weeds, the most horrid miscreants that ever degraded human nature—"With vociferations that would startle deafness, and execrations that would appal blasphemy, they celebrate their night orgies, to the reproach of magistracy, the scandal of decency, and the terror of sobriety.‡ Leagued with these are bands of robbers who infest this ill-policed city, and render it dangerous to the passengers who walk at night. My banker recommended to me a lodging in Capel street, near Essex Bridge, assigning as the reason, that as it was the most public part of the town, I was in less danger of being robbed on coming home late, for it seems that even two chairmen are not a sufficient protection."

‡See Barrack street in 1825.

(21) There is a most curious picture of the importunate insolence of Irish chairmen in the last century to be found in Swift's Correspondence. Like the Trasteverini of Rome, their physical force rendered them formidable to all classes: even in the finest weather they were wont to force the dandies of the day into their sedan, and frequently offered "to convey them and their dolls for nothing" to prevent the habit of walking becoming fashionable.

(22) Several of these kind of houses were to be seen in Castle street, High street, Wood quay, and Thomas street, between the years 1760 and 1780. The Winetavern street, so called in Camden, being the street where the taverns were kept in 1316, is still in high preservation.

(23) Swift was born in Haly's Court, and the "deified Vanessa" lodged in "Turn Style Alley, near College Green."

(24) The Carberie was also inhabited by the Ormonde family during the vicissitudes of the Geraldines. It became again the property of the Earl of Kildare, and the habitation of that illustrious chief, who continued to reside in it till the dispersion of the family in the reign of Henry the Eighth, when five of them were publicly executed, and the rest died in misery or fled into exile.

LOVE.

BY E. B. F.

Yes, better to have loved, altho'
Deceived and wronged thou art,
Than never to have felt the glow
Of love within the heart;
And better to have won and lost
Than never to achieve—
Altho' the heart's great love was crossed,
The heart should never grieve.

The loves of earth, however bright,
Are mingled joy and pain;
Earth's gems gleam with a wavering light—
Earth's constancy is vain:
Yes! only when, deceived and sad,
Resigned we look above—
Give heaven the place a mortal had,
We gain a perfect love.

WHY RAIN IS BETTER THAN THE SPRINKLING POT.

Many persons must have noticed that the most diligent sprinkling of lawns and flower-beds fails to impart to the grass and plants a vital stimulus equal to that which comes from a good shower of rain. A correspondent reminds us of the reason for the difference. It is because rain, falling from a great height through the air, brings with it a considerable quantity of carbonic acid, of nitrogenous particles, and of other elements nutritious to plants, which it has washed out of the atmosphere. So a sprinkler used from the top of a tall building might be slightly more effective than when employed at the surface of the ground.

OUR WEEKLY STORY

CONDEMNED.

By ETHEL GODDARD.

Old Mary Cafferty stood in the doorway of her little cabin. She shaded her eyes from the sun, and gazed intently at a cloud of dust which advanced down the road, for it was a cloud which promised something to be seen, perhaps even somebody to talk to, and though Mary lived all alone, resolutely refusing to share the home inhabited by her daughter and her half-dozen babies, she was by no means averse to a gossip when occasion offered. Mary was a tall, gaunt old woman, her brown face was thickly seamed with dirt, the wide, humorous mouth appearing to be but a deeper, more pronounced seam than the rest; her black eyes were both merry and sad at once. The whole face bore the imprint of Ireland's geniality and Ireland's insincerity, for, old as Mary was, neither of these qualities had become impaired, and the villagers who lived a mile away from her cabin said that she was "a 'cute ould wan enough."

The car drew up at Mary's door. The old woman hurried forward. What could "quality" want with "the likes o' her"? "Quality," represented by a young man clothed in a ginger-coloured waterproof, jumped off the car. "Good day, ma'am," he said; "can I have a look at your little place?" Mary ran her shrewd black eyes over the stranger. Here was clearly no scion of a family of "quality"—her unerring Irish instinct told her as much at once—but still the young man was not of the type which usually enjoyed a friendly "crack" with her, and as a novelty he was welcome.

"To be sure, sir; to be sure. Step inside. 'Tis a poor little place enough, but 'twas built by me father—heavens be his bed—an' built no thanks to any o' them too—built be snatches an' unbeknownst, till he put the roof on it and faced the world."

"Oh, ah! Squatted, I suppose?"

"Yes, sir. Bend your head, sir, comin' in at the door. Now ye see me little place. An' what would be bringin' ye here, sir, if I might make so bould?"

"To see your little place, ma'am, what else? Why, your floor's all in holes, and look at the puddles. Scandalous! Look here, too!" He raised his stick and prodded the thatch, from which a dirty brown drip started in an instant.

"Shure, indade, 'tis not too good. I do be prayin' to the Blessed Mother to send me eight shillin's to buy straw till I'd get some o' the neighbours to thatch it for me." Mary's eyes wandered towards the pocket of the strangely inquisitive young man.

"Your floor's terribly dirty, and the smell would—would knock you down." The young man was groping for a pocket handkerchief.

"Ah, shure, that's the hens. They do be about it always, an', indeed, it's the gallows to keep them out." The young man backed out of the doorway.

"Good day, ma'am, I'll stay with you no longer, thank you. Your perfumes are a bit strong—more peculiar than pleasant! Good day."

The car whirled away again, this time towards the village, and Mary was left to ponder upon a new experience.

"Musha, bad luck to him," she muttered. "What call had he to be comin' in an' givin' impidence to a lone body—an ill-lookin' bosthoon like him."

All day Mary speculated as to the calling and position of her unknown visitor, but it was not until evening that light came to her. She was standing again in the doorway when, walking down the road, she espied the landlord's steward, John Muldoon. Now, anything which was to be known was known by John, and why should he not have some light to throw upon the question of the ginger-coated youth?

"Good evenin' to ye, Misther Muldoon," she called out. "Would ye be in a hurry?"

"No hurry in the world, Mary, an' 'tis you I'm comin' to see."

John seated himself upon a stone, leaned against the grass bank by the cottage door, and looked up at Mary, enjoying the inquisitiveness in her eyes.

"To see me, Misther Muldoon! Ah, now, an' what for would ye be doin' that?"

"Be the masther's ordhers, Mary. An' I'm not yer first visitor to-day, though I'm not so illigant as he was, to be shure."

Mary looked eagerly at him.

"Who was he, Misther Muldoon, ye'd know if anyone would?"

"What was he saying to ye, Mary?"

"That the floor was in holes. I'd like to see where he was brought up. An' that the smell 'ud knock ye down, an' that the little place was scand'lous. It that was built no thanks to anyone, in the masther's father's time, an' your father's time, too."

"Aye, it 'ud never have been done if I was there, Mary, ye may take yer davy o' that."

"Who was this young bosthoon, Misther Muldoon, with ne'er a word o' civility out o' him"

"He was askin' ye about the floor an' the roof, I daresay, too, an' said the smells 'ud knock ye down. Now, who would he be, Mary?"

"That's what I'm askin' ye, sir."

"Why, who would he be, Mary, only the sanitairy. An' the upshot of it is, ye're to leave to-morrow, for the house isn't fit for a Christian to live in."

The old woman's eyes flashed, all the pleasantly shifty expressions of a moment before was wiped away by the primitive fury which in Ireland is so very near the apparently gentle surface.

"I'm to go out of me home that I've lived to be eighty come Christmas in, all because of a blatherin' boy. The little place was run up widout the help of anyone, an' John Muldoon, yer father and' yer masther's father, was rare put out when they seen it, and' if yez think I'll go out o' it for the likes o' you, ye're mistaken, an' I'll say the same to the masther an' the bench o' judges. Sanitairy indeed; a young whipsther that makes his livin'; a turnin' decent people out o' their houses!"

Mary's face had turned to a dull red; her black eyes semed to have a fire behind them. She shook from fury and from a certain acknowledged fear.

"Quiet, now—quiet, Mary," said John, rising from the restful stone. "You'll have to do what the masther says, anyhow, and' he sez ye can't stay on an' the house in such a state. Shure yer daughter 'll take ye, an' she's a dacint girl, wid a quiet husband. You'll be better nor here." John's eyes wandered contemptuously over the smoke-begrimed cottage, which seemed to be surrounded by a puddle.

"The masther sez I'm to go—now do ye tell me? Aye, an' so did the masther that's dead an' rotten, say to my father (may he lie easy). Nor for masters or sanitairies, nor any o' the lot will I leave the little house me father built, an' ye may put that in yer pipe an' smoke it, John Muldoon."

"Look at here, Mary," said John earnestly; "look at here. Ye'll do best to go quietly; ye'll get more by it, do you understand?"

"Get more by it, more by it!" Her voice rose to a shrill scream, "God an' Mary'll mind the poor orphan, an' no need of masthers or sanitairies. Get more by it, get more, livin' wid me daughter an' her man, and them babbies, an' grudged the bit went into me mouth. Look at here, John Muldoon, out o' this I don't stir till they take me to me rest, an' that'll not be long wid the tratement I'm gettin'." The fury had broken, tears flowed copiously; John turned away.

"Mind ye," he said, "ye're warned, an' tomorra out ye go."

Next day down the road came an ominous procession. Many stood in the cottage doorway again to see who they might be who walked in a row and looked toward her cabin. She folded her arms, compressed her mouth so that it looked more than ever like a thick line, and bent a stern look upon the advancing party, which consisted of her daughter, John Muldoon, the police sergeant, and a few villagers, who looked forward to an amusing scene.

"Good mornin' to yez," said Mary. "Good mornin' to yez, ye're a pleasant party for walkin'. Mag, does yer man want no dinner that ye're out sthravagin' at this time o' day? An' is there nothin' for you to do, John, but be goin' gallavantin'?" John Muldoon said nothing but hung back, looking toward the woman whom Mary had called Mag. She stepped forward.

"Mother, the masther has sent word that the sanitairy sez yer house isn't fit for ye to be in, and Mick an' me wants ye to come an' live along with us, an' we'll do our best for ye."

"Thank ye kindly, Mag, but I'll not be troublin' ye. Will the sanitairy giv ye half what's he's after gettin' for swarin' a dacint woman out o' house an' home?"

There was a suppressed snigger in the group, Mary's tone of shrill and sardonic politeness being deemed vastly entertaining, but the sound of amusement roused the old woman still further.

"Why then, ye lot of good-for-nothin' thramps, will ye tell me what you may be wantin'? Peg Rafferty, do ye want to give me half yer outdoor relief Mrs. Brennan, ma'am, are you dyin' to give me a home? Begone the lot of ye I say; begone, an' lave a dacint woman alone." Mary's face was red from anger and excitement. She trembled visibly and clutched the rotten door-post with one hand; all her anger rose from one fear, the fear that they would tear her away from "the little place." She faced them all bravely

"Begone, the whole o' ye."

John Muldoon stepped forward. "Now, Mrs. Cafferty, I tould ye yistherday this was detarmined on. Go quietly now wid Mag an' give over this noise."

"Thank ye, Misther Muldoon, me house was built no thanks to anyone, an' wid the help o' God I'll stay in it till I die."

John Muldoon beckoned to the sergeant. "Spake to her, sergeant," he said, "tell her the law o' it."

The official drew himself up.

"Mary Cafferty, me good woman, the law of it is ye've got to go. The sanitary inspector has pronounced yer house to be unfit for human habitation."

"Whethen indade, Sargeant, ye're very good to be tellin' me the law o' the matther. Agen the law me father kem here an' agen the law I'll stay. Aye, me that's a poor orphan. There's none for the poor here, 'tis the masther, the law, an' the sanitairy here; wait though, an' there'll be a time when God and Mary'll crown the orphan, the poor lone destitute woman." Mary's angry declamation ceased, she wiped her eyes with the corner of an ill-used apron.

"Ah the crathur," said one old woman pityingly, "ah, look at her now. Shure, Mary, honey, go up an' live along wid Mag an' her man, 'twill be betther for ye nor here in the dirt an' could."

Tears were forgotten, the black eyes flashed anger again.

"Ye're a good one to be talkin', Moll Byrne, ye are, an' what keeps up your fine house only the money from yer son in Ameriky, an' he shipped off afther turnin' the dirty informer on dacint men worth a hundhred o' him!"

The shot struck home. Moll Byrne attempted no more consolation, but shrank back offended, and the little group looked to the sergeant to speak again.

"Come, come, Mary Cafferty, ye must g'up out o' this, an' not be obsthructin' me an' Misther Muldoon in the performance of our juties. I'll be obliged to forcibly resthrain ye an' to confine ye in the barrack if ye stan'

there givin' back answers to them as works for yer good. Go up now along with yer daughter an' yer goods 'll be sent afther ye in an ass cart."

"I'm mighty beholden to ye, sargeant, but I'm not thinkin' o' movin' at present. Now I'll thank ye all not to be stannin' pausin' there in front o' me door. Good day to yez." The abrupt speech was a last effort. The old woman looked angrily, furtively round the group, fully realising that her chance of remaining in the dear grimy cabin was but a small one. The sergeant laid his hand upon her arm.

"Me good woman, will ye proceed on quietly up to the village along with yer daughter, or will ye come in charge of me. Answer now sharp, for I've no time to stand dallyin'."

Mary vouchsafed no word to the indignant representative of law and order, she gazed over his head up to the clear blue sky, and shaking his hand off her arm stood silent for a moment. Then, turning to the wondering group, she spoke again in a shrill excited voice.

"When me father, that's in glory, set about for to build this little house the blessin' o' God was on him, for he got the roof on to it before ever the ould masther or John Muldoon's father set eyes on it. When I was left a lone orphan me man an me lived here too, and here I rared May there, that's come agen her ould mother this day. An' here I lived a widdy, dacint an' quiet, askin' to hinder no one,—Kape yer tongue in yer cheek, John Muldoon, an' don't be whisperin' there, 'tis the laste ye can do to let me spake. I'm gev notice to quit now on the head of a young whipsther of a sanitairy, and theres no one to spake for a lone woman, so go I must. Me things'll come on an ass cart! Aye will they. Any that's left over afther the thievin' they'll get! Who'll bring me the little Agnus Dei I got last Christmas from his riverence, an' it a little jool in lead, who'll bring me the little chain me husband's cousin's niece gev me, an' she breakin' up to go to Ameriky? Look at here, Sergeant, an' you John Muldoon, if e'er a screed is missin' God an' Mary'll remember it to ye. I'm an ould woman, an' there's no one to help the poor, only mind ye, blessed are they that weep; an ye've made me weep tears o' salt this day."

Pushing silently through the little group, disregarding all words of sympathy, Mary walked up to her daughter. "Come along with me, ye unnatural child," she said, "ye unnatural child that sides with a sanitairy agen yer own mother."

Weeping and wiping her eyes, Mary Cafferty turned away from her little cabin, feeling that she had discomfited the enemy, and had, at all events, scored a moral victory.

When installed in her daughter's house Mary became silent and morose, no friendly neighbour coming in for a "crack" could get one word of the old cheery gossip from the erstwhile garrulous talker, and the villagers began to whisper that "ould Mary Cafferty was a bit asthray since she was put out o' her little house." Surely enough, the old woman's gloom gave cause for alarm, and when one day Mary on meeting "the masther" launched forth into an excited and highly coloured description of how "the sanitairy had come an' thumped an' poked wid his stick, an' thramped about as never was an' had bruk a hole in her roof wid his meddlin' an' pokin', her daughter began to watch her carefully lest harm should come of her wild ideas and excited moods.

Mary Cafferty kept her thoughts in her heart and brooded silently over the seeming injustice which had robbed her of her little home, only occasionally did she unbosom herself and speak of her woes, and then it was always the same story which she poured forth, of how "the sanitairy had kem an' poked a hole in her roof an' then turned her out into the could."

Mary's daughter and her numerous family slept all together in a good-sized room opening off the kitchen. Mary elected to sleep in the kitchen itself, "for," she said, "I do be moidhered wid the childher squallin' an' Mary an' her man snorin' there, not like a poor ould body that can't get a wink o' sleep wid pausin' an' thinkin' o' better days."

It was on one wild and rainy night that Mary rose from her mattress, which lay on the floor near the dying fire, and moving stealthily, dressed herself in the ragged skirt and faded shawl which she wore by day. "Shure I cant see me boots, but what matther for that," she muttered, making a weird picture in the light of the flickering turf fire as she stood roughly and hurriedly dressed. "Mother o' God, 'tis a crule night," she whispered as the wind slashed the rain against the windows and rattled the door. Tiptoeing across the room, she lifted the latch slowly, timorously, well knowing that a tell-tale click would follow any quick movement.

Once outside, she did not fear detection, for the rain and wind would quite cover any sound of footsteps.

The old woman stood dazed for a second, while the rain and wind madea sport of her poor thin rags, then folding her shawl more tightly round her, she stepped forward bravely, with head bent, to the storm.

Mary's black eye shone joyfully; her face was full of a sort of excited joy, and out for an occasional stagger when the body momentarily asserted its weakness, she walked with the strength and speed of a young woman talking to herself the while in a strange exultant whisper.

"I'm right now—I'm right; I know every inch o' the road, though 'tis easy enough to lose yer way o' such a night. Me poor foot! That's a stone." She staggered heavily, almost falling. "Divil blister that haro for takin' away me boots. I'm right now, an' none o' them 'll get me out whin I get to it. Sanitairy an' all, I'll stay there now, an' the Blessed Vargin 'll purtect me an' keep from them that's agen me. Lawnies, 'tis a night! Ah!" With a deep gasp for breath Mary stood a while, trying to pierce the darkness, half blinded by the driving rain. On she went again, more slowly than before, and limping from the pain of her feet. "Here's the turn. Losh, I'm up on the toepat'." She scraped her nails along the whitewashed wall of a cottage, and carefully feeling her way from it gained the road again. Sog, sog, went the bare feet on the road. Mary was shivering with cold now, and the closely held shawl being wet through did but chill her to the bone.

"'Tis worse nor I thought." The first elasticity of excitement was worn off, and it was a very tired, footsore old woman, who, brave still, tramped on through the thick mire.

Swish, swish, went the trees beside her. "I'm at the plantation now," muttered Mary. Then came the sound of a trickling stream. "'Tis only a bit now," the voice ended in a gasp. On again bravely, steadily, then another stop, an excited whisper, "'Tis here now is the little turn in to it, here's the very puddle in the front o' it. Praise the Vargin I'm home agen, only if I had e'er a match on chancst that they shut the door. Ah!" Mary fell back involuntarily, then came forward again. "Vargin Mother, what's that an' me black sober an' ne'er a thing but a sup o' tay this month. Shure, I felt a sore prickin' sting an' a tear-like. There 'tis agen. Holy St. Joseph, if I had e'er a match." The whisper had risen to loud and excited speech, the "prickin' sting" had maddened Mary. Again she went forward, this time with her hands stretched out to ward off the pricks from her body. She came against what seemed to be a row of sharp pointed things which pierced the flesh. Mary felt the trickling blood running down her hands. Frenzied she dashed herself against the opposing force, clutching, clawing at it.

"Come out o' that ye devil," she screamed. "An, come out o' that wid ye. Would ye now, would ye." Another drive of pain, her hands seemed to be masses of agony; the sharp cutting things prodded her arms through her thin clothing, they pierced her legs, poorly covered as they were in wet rags. Mary raised the black eyes, erstwhile full of hope, now darkened with agony, to the inky heavens. Nothing but darkness was round her, darkness and driving rain; before her the stinging, mysterious enemy; beyond, home, "the little place."

"Come out of it ye devil. Mother o'God, dhrive them away." Again she pressed forward, contesting the way with the flesh-tearing terror. Her eyes were wild, haggard, her mouth strained sideways in pain and bewilderment. Her hands were wet; blood was on them—she felt it when she raised them to her face for an instant. She stood dazed, exhausted, torn, drenched to the skin, buffeted by the wind. The night, though fierce, was a summer night, and short. Over ahead of her came a break in the blackness, the first sign of dawn.

"Mary, Mother!" she muttered, her voice hoarse from chill and weakness. "Mary, Mother, dhrive away this devil now wid the dawn. Let me get sight o' the little home an' get in before the polis come."

Again she came forward, staggering this time, stretching out her hands feebly in an effort to regain her balance. Again were they torn by the relentless enemy.

Light was coming. Suddenly it seemed that the clouds broke. Mary peered before her; she saw the white walls gleaming. She stood back, sore, baffled, panting. She would wait. More light; the clouds scurried away from the brightness. She could not see much yet, but she realised dully that she was very cold, and that there was a tell-tale redness on her hands, and that a stream of blood had flowed down her skirt. More light, the sharp old eyes could see now, there were the white walls, but the roof; where was the old thatched roof? And that devil—ah, there it was, cruel, sharp, newly stretched—a barbed fence between her and the now roofless little place.

Mary's eyes seemed to grow dim; a scream forced itself to her lips, but could not get through because of the huskiness.

"May the curse of God light"—It was painful even to say so much, besides the will to say was gone. Mary's mouth worked loosely; she examined her raw and blood-stained hands with a childish smile and a wistful impersonal curiosity. "A pound o' chops," she droned, "a pound o' the best, the best, an' exthra for the orphan. Ah, ye would, would ye." Clutching at the air, Mary reeled and fell backwards into the brackish puddle, and the curtain fell between her and reality.

In the morning the searching villagers found her there, sitting still in the puddle, huddled up, her knees touching her mouth. In the kindly heat of the summer sun the moisture rose in steam from her soaked clothing; yet she sat there, indifferent, calm, watching the pitying neighbours.

"Musha, good day to ye all." The group drew near to hear the husky whisper. "Is there any man o' ye will open me door an' I shut out here, but ye see I've the best of a fire"—she looked intently at the steam from her ragged dress—"I've the best of a fire, and a good bit of mate, too. Look at here, he gev me exthra." She held up the red, raw hands with the bloodstained sleeves above them, smiling amiably the while, though all the time her mouth worked loosely and her eyes were restless. A murmur of horror ran through the group of neighbours, but the object of pity sat there to all appearance unconcerned.

They took her home. "Ye'll open me door an' bring me back," she said. "Aye, Mary, woman," they said, "when ye've had a dhrop o' tay."

That night Mary lay in the home of lost wits, dreaming the dreams of confusion with many other unfortunates. But never did the picture of the storm-tossed, blood-stained old woman fade from the minds of the villagers. "Musha," they said, "she lived there to be ould enough, an' when they went to save her life they as good as kilt ed her.

ANCIENT IRISH SOCIETY.

THE IRISH FIGHTING CLANS.

THE O'CARROLLS OF ELY.

By Rev. F. R. MONTGOMERY HITCHCOCK, B.D.

[ALL RIGHTS RESERVED.

ALL RIGHTS RESERVED.]

PART I.

The O'Carrolls of Ely are another of the fighting clans who made the subjugation of Ireland an extremely difficult task to the English Lord Deputies and settlers. Though they never succeeded like the O'Conors in bagging a Viceroy and keeping him prisoner until a ransom and hostage were given for him, they displayed a certain amount of natural taste for warfare that was extremely disagreeable to their more peaceably-disposed neighbours. It is true that we do not find them carrying on long and organised campaigns like their friends in Offaly, but sallying from their strong castles—their "small piles of little importance, the chiefest whereof is Limwaddon," as Dimmock describes them in his Treatise on Ireland (1600), they were able to inflict many a crushing blow on their adversaries.

Ely O'Carroll, to call the clan by its proper name, derived its descent and domain from Eile or Ely, seventh in line from Cian or Kean, a son of the famous Olioll Olum, King of Mumha, now known as Munster, or Moonster (Mumhan-stadr), the place of Mumha. According to O'L-Uidhren Ely O'Carroll was divided into eight tuatha or districts, over which O'Cearbhaill or O'Carrol was the ruling chief. The territory of Ely is almost coterminous with that part of the King's County which belongs to the diocese of Killaloe, and includes the baronies of Clonlisk and Ballybritt. Ikerrin and Eiogarty, in Tipperary, were detached from it at an early date and given to "Ormond." Birr, the ancient Biorra, or plain of water, in the Umbilicus Hiberniae, or centre of Ireland, according to Giraldus Cambrensis, seems to have been the headquarters of the tribe when they first emerge into history. According to the poets they were a hospitable, fierce, and yellow-haired race, to whom the neighbouring tribes were compelled to pay tribute.

In the Book of Rights the tribute levied on the King of Caiseal (Cashel) by the King of Eile is thus described:—

The stipend of the King of Eile, often gold,
From the King of Caisial, of the banquets,
Six shields and six bright swords,
Six bardsmen, six bardswomen.

Up to the slopes of Sliabh Blahmo (Slieve Bloom) the O'Carrolls of Ely held sway, and were found to furnish fewer forces than the other kings. There was gold in the country in these days, the gold from which crosses and chalices, torques and chains, bracelets and bodkins, were fashioned, and with which the warrior's sword was inlaid and the lady's mantle inwoven. And in gold Ely was rich, for the O'Carroll was "King of Eile of the Gold." The chief was also rich in cattle and herds, that found pasture on the green slopes of the hills and in the well-watered plains of Ely.

A bard, O'Heerin, who died in 1420, thus alludes to this princely race:—

Lords to whom great men submit
Are the O'Carrolls, of the plains of Birr.
Princes of Eile, as far as tall Slieve Bloom,
The most hospitable land in Erin.
Eight districts and eight chiefs are ruled
By the Prince of Ely, of the land of herds;
Valiant in enforcing the tributes
Are the troops of the yellow-ringletted hair.

For it appears that in the year 212, when Ely comes into notice at a very early period. Fergus of the black teeth reigned in Ireland, that the King of Ulster gave a feast at Magh Breagh—the Plain of the Wolf—to which Cormac MacArt was invited. But the guest falling under the displeasure of the King, the cruel but curious order was given that Cormac's fair beard—of which the possessor was proud—should be burnt. Cormac immediately applied to Thady, who was then Chief of Ely, for assistance, and overthrew the King of Ulster in a great battle, and wiped out the disgrace of his burnt beard in the blood of his foes. To Birr, the seat of the pagan worship of Fen, and the chief stronghold of Ely O'Carroll, came the good St. Brendan, St. Columkille's friend, whose prophetic gift, long life, and profound piety formed the theme of many a legend, to spread the light of Christianity and to found a monastery, about 550 A.D. Here the Kings of Ireland and the Kings of Munster had royal meetings. Through here Felim of Cashel passed in his terrible expedition to Tara, plundering and slaying all that fell in his way. Hither the "foreigners of the Boyne" (as the Four Masters describe them), the Danes, penetrated in 841, of which inroad of destruction Ely O'Carroll has a perpetual record in the name of Oxmantown—or the town of the Ostmen. Here the tribe of the O'Conors, the Hy Failge, were defeated and many of them slain, with Cinaeth Cruach, in 949. From here a strong detachment of the O'Carrolls marched to join the standard of Bryan Boroihme, and helped to hurl the ruthless invaders—the Vikings of the North—into the sea on the strands of Clontarf. In 1121 the town lay under the fear and distress of a terrible siege. For Torlogh, the son of Roderick O'Connor, King of Ireland, had collected a great army and "encamped near Birr for some months," and then, to the infinite relief of the O'Carrolls, he was forced by the heavy snows and bitter cold of winter to withdraw to Connaught again. The history of the O'Carrolls begins with a sacrilege—the murder of a King. O'Hendersgeol of Cathuighe in South Munster, who was stabbed as he was leaving the church, and fell dead on the threshold (1154). And twenty years afterwards Rughry O'Carroll, King of Ely, was slain by his own brother on an island in the Shannon. It is the story of a red-haired and red-handed race that we are now commencing. But when we remember the fierce times in which they lived, and the wild and ungovernable passions of a people who had never experienced the blessing of peace, who had but half learnt the lessons of Christianity, and who had imbibed from their parents that inborn love of fighting which has now been happily turned by English influence into more useful but not less vigorous channels, we may not judge them harshly, though we may congratulate ourselves on the fact that their day is over, and their dread is past.

The English invasion should have had at any rate one good effect in making the isolated tribes and principalities of Ireland forget their private feuds for a moment and combine to some extent against their common foe. But the clansmen of the different tribes would not amalgamate; they had been so long accustomed to hate and fear, to distrust and dislike their neighbours. And so they presented an easier task to the Anglo-Normans than they had doubtless anticipated. It was in consequence of their dissension that the English King was able to portion out their dominions to his favourite and trusted knights, and that the latter were not afraid to occupy that part of the land that fell to their share.

It seems that Henry II., without consulting the wishes of the O'Carrolls, had made over the estates of Ely O'Carroll to Theobald Fitzwalter, the ancestor of the powerful Butlers of Ormond, and that the treacherous John, with an equal disregard for his father's promises, sold the same lots to Walter de Braosa for a large sum of money, so that Fitzwalter had to purchase Braosa's claim before he could take possession. This he at once proceeded to do, having granted part of Birr to Hugh de Hose or Hussy. The O'Carroll opposed his entrance into his dominions, but suffered defeat, losing his own life in the battle. The English invaders were now greatly aided in their conquest of Ely by the unpatriotic action of Moriertagh MacBryen of the Mountain, a Tipperary neighbour, who seized the opportunity while the O'Carrolls had their hands full, to overrun their country. According to the Annals of Clonmacnoise, this highland chief besieged the castle of Byrne, and at last burnt the whole town. He then attacked the castle of Kinnetty and the castle of Lothra, and broke them down and destroyed them, thus leaving the country of his neighbours completely exposed to the incursions of Fitzwalter and his men.

Kinnity was in one of the frontier fortresses of the O'Carroll sept. It is supposed to have got its name from the fact that the head (ceann) of Etech, an Irish heroine, was buried there. Its tower was built on a spur of the mountain range of Slieve Bloom, and several to protect the O'Carroll's country from the invasions of the foreign Danes and the native Irish. That castle, with others belonging to the sept, now fell into the hands of the English, who profited by O'Bryen's campaign by occupying and restoring the castles of Durrow, Birr, and Kinnetty. Having already erected a castle at Athlone, the central plain of Ireland was now dominated by English spearmen, archers, and cavalry.

But the O'Carrolls were not conquered. Far from it, for when defeated in the field they had strongholds to flee into, even those at Clonlisk, Dunkerrin, Emil, and Lemivanane, or Leap. Behind the stout walls and deep trenches of these fortresses they were safe until gunpowder was brought to bear upon them. Then only did they yield.

At Coulisk, the meadow of the fort, two miles from Shinrone, the O'Carrolls of the reddened spears were able to inflict a defeat upon a force of English who were marching to surprise them from the South, but who found in Shinrone (the seat of the Dzal) a veritable ambush of fierce and nimble warriors. Intestine feuds from this out helped to decimate the ranks of the O'Carrolls. The men of Ossory, on the one side, and the fierce kerns from Arran, on the other, proved relentless and persistent foes. The Lord of Ely was slain in battle on his own lands as he was leading his men against the Ossorians, and James, Earl of Arran, took Teige O'Carroll, his own brother-in-law, prisoner, and kept him confined for eight years. But Teige escaped from his dungeon, to be afterwards slain by Lord Deputy Scrope.

But amongst the fiery chieftains of this race some few were found who had more pious aspirations than to live the life of Ishmael, with their hand against every man and every man's hand against them. For, as we found an O'Conor withdrawn from the scenes of blood to the studies of the cloister, so we find Thady O'Carroll desirous of retiring into a more obscure but pious existence. But his clansmen and the lords of Eastern Munster prevailed upon him to remain as he was, so he compromised matters by paying a visit to the Pope, and afterwards was received at the Court of King Richard II., who was preparing an expedition to Ireland. But he seems to have been the solitary member of the reigning family that evinced such a desire, for those who went before him and those

who came after were conspicuous for the terrible Berserker rage that has ever distinguished the Celtic race.

Right up to the town of Birr in Ely ran the ancient territory of the O'Maolmuaidh, O'Mulloy, called Fearcall or Feara Ceall, which means the "men of the churches." The land of the O'Mulloys, which comprised the modern baronies of Eglish and Ballyboy, lay in the ancient kingdom of Meath, and between the dominions of the O'Conors on one side and the O'Carrolls on the other. We shall refer on a future occasion to this clan. It is sufficient to state here that in spite of the number of religious establishments and churches that were in this country of the O'Mulloys, the race were anything but religiously inclined, if we may judge from their perfidious and cruel treatment of their neighbours and their own people. The numerous strongholds and the dense forests, of which the "Great Wood of Fearcall" is still pointed out, offered facilities for treachery, for smiting men in the dark, for lurking in ambush, for doing foul deeds with impunity, of which the O'Mulloys were not slow to avail themselves. Cian, "the illustrious heir" of Ely O'Carroll, had a quarrel with an O'Mulloy, which was natural, seeing that they were close neighbours. And the O'Mulloys vowed vengeance. The result was that as Cian was passing carelessly one day through the woods on his own borders a javelin hurled by Hugh O'Mulloy—the heir to the lordship of Fearcall—who was in hiding, passed through his heart. This is put down as having taken place in the year 1380. Two years passed and Fergal Roe, son of MacGeoghegan, chief of Kinel Fiacha, was treacherously slain by the members of this clan.

Thus perished a scion of the fighting house sixteen years before Thady wished to resign the sword and take the vows. O'Carroll, a successor of Thady's, who did not take after him, becoming involved in a quarrel with the Butlers of Ormond, the latter entered Ely and dismantled two of O'Carroll's fortresses. Fifteen years passed by enlivened by the usual campaigns, when another enemy of an even more destructive nature invaded the land, and spared neither high nor low, priest nor peasant, Celt or Norman even—the plague. Then died Hussy of Galtrim, the claimant of Birr, whose battle cry of "Cor-deragh-aboe" had frequently terrified his opponents, and with him, it is computed, perished about 700 priests. But the O'Carrolls seem to have been but lightly touched, for we find them in power shortly afterwards, and compelling the counties of Kilkenny and Tipperary to pay 40 livres yearly. This was about the year 1460.

Great pressure was, however, brought upon the Lord Deputy, the Earl of Kildare, by the English of the Pale to release them from the tyranny of the O'Carrolls, and he invaded the country and besieged the Castle of Lemivanane (Leap), which, according to the Four Masters, was one of the best fortified and defended castles of the age. But he failed to take it, and, returning home to get more forces, fell sick at Athy, but managed to get back to Kildare, where he died. His son, Gerald, immediately assumed the reins of government, and resumed the siege of Lemyvanane, which he succeeded in taking.

(To be Continued.)

AIRSHIP CONTEST AT ST. LOUIS.

During the World's Fair at St. Louis in 1904 a contest of airships is to take place, the grand prize being 100,000 dollars. The sum of 50,000 dollars will also be awarded in minor prizes. The course to be sailed over will be L-shaped, one leg being longer than the other. Captive balloons will mark the end of each leg and the meeting point of the legs. The starting point will be at the angle, and each competitor must encircle the three captive balloons in opposite directions, and must make at least three complete trips at an average speed of not less than 10 miles an hour.

NOTES AND QUERIES.

REDMOND O'HANLON.

TO THE EDITOR DUBLIN PENNY JOURNAL.

20 Sydney Avenue,
Blackrock, Feb. 5th., 1903.

Dear Sir,—I daresay you remember me writing to you on the subject of Redmond O'Hanlon, which appeared in your issue of Dec. 20th, 1902. I desire to thank you and the gentlemen who were so kind as to answer my questions, in particular Mr. Phillip Crossle, of Newry, who wrote me and enclosed a very interesting communication which may interest your readers:—

"Bryan Mullane and Joane, his Wife v. Edward Courtenay and Others—26th Feb., 1700.

"Suppliants Bryan Mullane, now of the city of Dublin, and Joane, his wife, which Joane was sometime the wife, widow, and relict of John O'Hanlon, late, while he lived, of Ballynlen, in Co. Armagh, gent., deceased, who in his lifetime and at his death was debtor to H. M. and your late Queen Mary; and the said Joane is now administratrix of said John O'Hanlon, with the will anexed of the said John O'Hanlon being lawfully possessed of the leases of the several townslands of Aghenteragh, Ballynlen, Enagh, and Ballyhahilled, leased to him for 21 years from May, 1693. Said John O'Hanlon made his will on 27th Oct., 1693, and among other things demised one-third of all his leases and goods to your suppliant, Joane then being his wife, and the other two-third parts to his two children, Redmond O'Hanlon and Mary O'Hanlon, and of his said will appointed Father John O'Hanlon (a priest evidently), his father-in-law, John Duffy, and his two cousins, Redmond O'Hanlon and Phelemy O'Hanlon, to be his executors, and soon after died (on 31st Oct., 1693). Your suppliant, Joane, further showeth that in 1695 she married Loughlin Donnelly, gent., who soon afterwards died. Your suppliant soon afterwards married again according to the rites and ceremonies of the Holy Church your suppliant Bryan Mullane, whereof your two suppliants became entitled to said lands." (Information abstracted from Exchequer Bills, Record Office, Dublin).

Mr. Crossle in a subsequent letter put me in the way of finding another life of Redmond O'Hanlon in the "Newry Telegraph"; also a sentence of outlawry on Redmond and others. This, indeed, was painstaking which I fully appreciate. Mr F. J. Biggar, M.R.I.A., whose letter appeared in your issue of Jan. 3rd, upon my writing to him at once very kindly lent me "The Lives of Irish Rogues and Rapparees," a book, by the way, I never expected to see, and also presented me with a very interesting life of Aneas O'Haughan, the celebrated Northern robber, written by Mr. Biggar himself, and he also promised to look up another life of Redmond O'Hanlon which he thought was in the Journal of the D.S.A. This kindness was astonishing, not to say gratifying, and in writing this letter I wish to emphasize it, and to show that anyone who applies to the Notes and Queries column in the "Dublin Penny Journal" need almost be sure of an answer from some of its courteous readers. And I might mention that my purpose in inditing this tedious communication, after that of thanking the gentlemen I have mentioned, is to make more popular your "Notes and Queries" column if possible. Mr. James Coleman, of Southampton, also sent me interesting particulars of "The Cromwellian Settlement," by J. Prendergast, for which I was very thankful.

B. M. J. O'HANLON.

COLONEL JAMES ROCHE, "THE SWIMMER."

TO THE EDITOR DUBLIN PENNY JOURNAL.

33 Longwood avenue, Dublin,
February 15th, 1903.

Dear Sir—May I, with your kind permission, add a few details to the very interesting sketch of Colonel James Roche, the swimmer. He is buried in Churchtown, Co. Waterford, about four miles from Carrick-on-Suir. A slab to his memory is inserted in one of the walls of the church. Near him lie several generations of the Everards, under a table tombstone, with the following inscription:—"Hic jacet Dons Carolus Everardus filius Gabrielis Everardi filii Joannis Everardi de Fethard, Equitis aurati et quon dam Justitiarius Regis Banco, hic quoque jacet uxor ei Catherina Wale filia de Gulielmo Wale de Cuilnemuc. Orate pro animabus suis [illegible] Mali 1643."

The Everards owned large possessions near Fethard, and also Burntcourt, near Clogheen.

The Walls held Coolnamuck Castle and demesne for probably seven hundred years. The last representatives of this ancient family left Coolnamuck about fifty years ago.—Yours truly,

P. J. GRIFFITH, M.R.S.A.I.

THE CRATHORNE ANCESTRY.

TO THE EDITOR DUBLIN PENNY JOURNAL.

14th February, 1903.

Sir—From the will of Ralph Crathorne, of Dublin, dated 1715, it would appear that he was married three times. Can any reader of the "Dublin Penny Journal" kindly give me particulars of his ancestry, or the names of his first wife and her children?

Was he identical with the Ralph Crathorne, of Crathorne, Co. York, born in 1634, who married Anne, daughter of William Tunstall, of Scargil Castle, York, or his son The family formerly resided in Baltinglass, Co. Wicklow, where a Geoffry Crathorne died in 1754.—Yours truly,

WILLIAM JACKSON PIGOTT.

NEVIN AND THULE—THEIR MEANINGS.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Sir—There appears in "Sullivan's Dictionary of Derivations—Celtic roots by O'Donovan (a very good authority)—that Glasgow, Glasnevin, Glasthule, Finglas, and Douglas are derived from the word glaise, a brook or stream, and that Ballyglass, Knockglass, and Moneyglass are from the word glas, green. Ardglass, Co. Down, was anciently Athglaise, the ford of the stream; its present name means a green height. The words gowan, a daisy, fionn, white or clear, dubh, black or dark, are easily understood. Would some one kindly explain the meaning of nevin and thule, and oblige—Yours truly,

Castletown, Isle-of-Man. W. MARTIN.

CHRISTOPHER MANUS O'KEEFE.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Christopher Manus (author of the paper "Were the First German Celts," published in Nos. 44-45 of the "D.P.J.") was on the literary staff of the "Irish People,' when it was edited by T. C. Luby, and after the seizure of that newspaper by the Government was one of the first Fenians tried at the earlier Special Commission. He was the only one who broke down in the dock, the dismal prospect of penal servitude to which he was sentenced, and which he subsequently endured in five different prisons having unmanned him. On his release he rejoined the Press. His last engagement in Ireland was that of Queenstown correspondent of the "Irish Daily Telegraph," a later form of the once well-known "Cork Southern Reporter." O'Keeffe was greatly liked in Queenstown, and his humorous reports of the affairs there afforded considerable amusement to his readers. On the extinction of the "Irish Daily Telegraph" at the close of 1873, Mr. O'Keeffe went to America, and was engaged by Mr. Ford on the "Irish World." He died at New York early in July, 1891. He was a good linguist, extensively read, the author of an Irish historical novel, "The Knights of the Pale," and of the "Life and Times of O'Connell," published by Mullany, Dublin. Simple-minded and sincere, he made many friends and no enemies. S.N.

As the author of "Absalom and Achitophel," Dryden was not only the most prominent literary figure, but the greatest force in contemporary politics. There have been many writers of political verse, both grave and gay, since Dryden, but none, from Pope to Mr. Owen Seaman, have combined in the same high degree literary merit with effective political partisanship (says a writer in "Longman's Magazine" for February). Never has any political writer turned mere party vehemence to such tremendous and permanent results. Even now his portrait of Shaftesbury—

Dark convict, seared by History's branding curse,
And hung in chains from Dryden's lofty verse

—discoloured as it is by the bitterest party prejudice, leaves an ineffaceable impression upon the mind.

THE RUINED TEMPLE AT PALENKE.

THE ANCIENT RUINS OF PALENKE.

REMAINS OF A HIGHLY CULTURED MEXICAN RACE.

By ENOS BROWN.

A TRAVELLER who recently visited the famous ruins at Palenke, State of Chiapas, Mexico, laments the changes which time and the elements are gradually making in their appearance and condition. Nothing has ever been done by the Federal Government to preserve these impressive monuments of the highly cultured race who constructed them and of whose history and origin but little is known. The climate of the region in which the ruins are situated is the direct opposite of that of Egypt, inasmuch as the rainfall at Palenke has been known to amount to 200 inches a year. The air is humid, and encourages decay, and at the same time stimulates the rapid growth of the vines and creeping plants, which are disintegrating the walls and pavements and will eventually level them to the ground. So dense is the foliage surrounding the ruins, that light from the sun is almost totally obscured. The photographer who was employed by the Mexican Government to take pictures of the ruins could accomplish his object in some instances only by means of a flash light. The ruins of Palenke are about 200 miles from the port of Frontera, and are reached by steamer up the Tabasco river to San Juan Bautista, and thence by trail. The group all lie within a radius of 2,000 feet, and consist of nine distinct structures, of which the "palace" is the largest and most central. The ruined buildings consist of temples, pyramids, acqueducts, and edifices whose purpose is not yet ascertained. The temple is the largest of all, and upon it the ancient builders lavished all their art. It includes a court and balconies, as well as great corridors in which tablets in bas-relief are fastened into the walls. Sculptures representing battle scenes and events of the nation's life are carefully depicted. From them the physical characteristics and domestic habits may be correctly ascertained. The dimensions of the "palace" are great. Its length is 238 feet, and breadth 180 feet, and it is elevated on a mound 310 feet long, 260 feet wide, and 40 feet high. The material used was stone, many blocks of prodigious size being used, and all joined together with mortar. As great architectural ability was displayed by the builders of the edifices at Palenke as was shown by the architects who erected those of the Nile. How it was possible for a primitive people to fashion, convey, and sculpture such immense stones as were employed is the wonder of modern archæologists .It would seem that the same people were the builders of these structures found at Milta, Mayapan, Tula, as well as at Palenke, a race which covered Yucatan and the Southern States of Mexico with mighty temples.

A French scientist with a lively imagination and unusual powers of observation credits the "Toltecs" with building these ancient temples, and fixes the seventh century as the period of their erection, but these confident assertions are doubted. Others place the era in which they were built as nearly as the date of the pyramids of Egypt. However, it seems to be proved beyond a doubt that many centuries before the discovery of America these ruins were in existence. It is not believed that Cortez or those with him knew of the Palenke ruins, though that conqueror must have been close to them at one time. Europeans first heard of them in 1750, but it was not until 1787 that they were explored. The key unlocking the mysteries hidden in the hieroglyphics which are carved on hundreds of tablets may some time be discovered, and the history of a great race of people and their origin be known, but their successors who now inhabit the region have no traditions that can aid the inquirer.

The ruins of Palenke should be preserved, and the Mexican Government owe that much to the world. If it were possible to clear the timber away and destroy the growth of vines which is rapidly overwhelming them, these interesting relics might be saved for the future. They have so far resisted the effects of time and physical convulsion, but must eventually succumb to the ceaseless, persistent, and silent assaults of an overwhelming tropical growth.

THE TOLKA.

ITS HISTORICAL ASSOCIATIONS.

SOME ADDITIONAL NOTES.

Mr. MacArthur writes:—In addition to those mentioned in the recent articles on the River Tolka, there are other interesting associations. The first town passed, Dunboyne, has an ancient record. Dr. Joyce gives the meaning as Baeithin's dun or fortress. We have another personage of that name remembered in the church at Dunganstown Parish, county Wicklow—namely, Ennisboyne (Baeithin's island or River Holm). In the reign of Henry VI, a writ was issued, 1423, ordering "the Provost and Commonalty of the town of Dunboyne to be at Trim with all their power for its defence." Dunboyne was burned down in 1798; the adjoining bog was called "the Moor of Meath." The ancient castle, formerly at Dunboyne, gave the title of Baron Dunboyne to the Butler family. Leaving Mulhuddart we pass to Clonsilla, "the Meadow of Sallows." The mill here was erected on the site of an ancient one called "the Devil's Mill,' 'from tradition of having been built in a single night, and was the old seat of the Carhampton Peers, Woodlands, later Lord Annaly's family, called Luttrellstown, and given by King John (who is said to have slept here one night) to the Luttrell family. Finglas, next reached, has many associations in addition to the ones mentioned in the articles. Archbishop King was Rector of Finglas at one time; Archbishop Narcissus Marsh lived at Violet Hill, Finglas; Dean Synge, of Kildare; Thomas Parnell, one time Vicar—these names appear in the Vestry Books, which are the earliest in the vicinity of Dublin, and commence 1657; they show the provision made for the supply of rushes at Whitsuntide and holly and ivy at Christmas. The monuments in the Parish Church include the Flower family (Lord Ashbrook), from 1681, and Colonel Bridge same time; the old Settle family of Finglas Bridge, with crests and coats of arms; the Cobbe family; also Gregory and Stubbs. The church plate dates from 1696 to 1705, the bells from 1729. Finglas Castle was in the rectory lawn, and was taken down in 1702, the first year of Queen Anne's reign. Cardiff's Castle was new, the foundations of which was discovered 60 years ago. In Finglas Wood was a castle of Queen Elizabeth's time. In addition to the famous Finglas Cross, there was another one in the churchyard, of what we have now no trace of any kind. In 1779 Austin Cooper visited it, and says: "There is likewise the remains of an old Cross, the top of which is broke off, and laid under the bottom stone or base." The Cross, coming to the light again in 1816, is another one, and was noticed in an early volume of the old "Dublin Penny Journal," also the "Dublin University Magazine." In the churchyard at Finglas rests Dr. Lanigan, the well known historian. The Finglas Manor was for years vested in the Archbishops of Dublin. Here died two holders of the office—Fulk de Saundford, in 1271, and Archbishop Fitzsimon, in 1511. The cotton mill of Fingals was burned down in 1828. The Finglas tannery, in Finglas Wood, lasted for close on two centuries. The old Finglas market was in the possession of the Archbishops of Dublin by grant of George I. The formerly famous Finglas fair was held here on May Day, and Finglas was one of the very last places near the Irish capital to have the Maypole up on each May Day, when all around the old Celtic custom dropped away. St. Canice, to whom the Finglas Church was dedicated, was educated at the great school of Clonard, along with the founder of the passed-away Church of Glasnevin, St. Movi, and when the latter left Clonard to go to the banks of the Tolka, the former came with him, and we see the name perpetuated in Finglas yet. The stay of the Williamite army in Finglas is remembered in the name of King William's Ramparts, at the back of the glebe house, and yet marked on the map by that name. The vicarage of Finglas was held for some years by Dr. Parnell, the friend of Swift, Pope, and Addison; and Swift names in his will, as one of his executors, a vicar of Finglas. The famous Cross, now in the churchyard at Finglas, gave the names to the Baronies in North Dublin of Uppercross and Nethercross; and as the articles in preceeding issues gave particulars, it need not be mentioned further. It appeared in "The Amateur Photographer" of November 6th last year. Joceline's account of St. Patrick visiting Finglas, and from there looking down on Dublin and predicting it would become a great city, is discounted by his later introducing St. Patrick into "the noble city of Dublin"; also Ptolemy's rendering centuries before of Dublin's status among their cities. Glasnevin, on the Tolka, the next place reached, is, according to Dr. Joyce, named from the little stream joining the Tolka from the classic grounds of Delville from the Bridge. Long before St. Movi established his Monastery, there lived a Pagan chief here named Naeidhe; from him it was called Glas-Naiedhen (Glasneean, "Annals of the Four Masters"), i.e., Naeidhe's streamlet—and the name later came to the whole village modernised into Glasnevin by the change of ah to v. Glasnevin has memories of Tickell, the poet, Addison, Swift, Dr. Delany, Steele, Sheridan, and Parnell. In the grounds of Delville was the temple, with paintings by Mrs. Delaney, and a medallion bust of "Stella"; in the grounds of Delville was found the printing press used by the great Dean of St. Patrick's in issuing his satires; on the other side of the Tolka was the residence of the Bishop of Kildare; a little farther Hampstead, where lived Sir Richard Steele; the old "Ink Bootle School" formed on the banks. Glasnevin Church was rebuilt in 1707, and in the churchyard there is a tablet to Dr. Delany, the famous vicar. The large field here was called "The Bloody Acre," from some engagement. Drumcondra or Clonturk next reached on the Tolka; the Bridge is the site of the original village; the old church past the "Cat and Cage" was erected by the Coghill family, who had a large tomb here to the memory of Marmaduke Coghill, Chancellor of the Exchequer for Ireland, in his official robes. In the churchyard rests Grose, the historian, and Furlong, the poet, who was buried here in 1827. On the Richmond road years ago was an old Dublin Huguenot settlement. Ballybough Bridge was the site of the old village of Ballybough or "poor town," and formerly owned by St. Mary's Abbey, Dublin. On the dissolution of the religious foundations by Henry VIII., we have it recorded of the then occupants of Mary's Abbey: "Then they were taken to the village of Ballyboght, belonging to the said Monastery, and slain." The charter of John says of the bounds of Dublin about this district: "Between Clonlic (Clonliffe) and Crynan, as far as Tolecan (Tolka)"; a charter of Richard II. says: "As far as the trench of the land of Clonclyffe (Clonliffe), and so along the trench to a green lying on the north side of the Abbatial house of St. Mary, Dublin, and from them between the green and the said trench in the middle way, leading from Oxmanstown to Tulgin (Tolka), through the middle of the road of the village of Ballybough." One of Henry VII. says: "They proceeded southward until they came to the highway going to Ballyboght, and from the gate of Ballyboght they came to the water of Tulcan (Tolka) by the Bridge of Ballyboght." The Bridge of Ballybough was built by John a Decer, the great benefactor of Dublin. At the battle of Clontarf it is recorded that the Danes were pursued with great slaughter "from the Tolka to Dublin." Before the battle the Irish forces camped at their favourite ground at Kilmainham, and then crossed the Tolka by Glasnevin to take up their position. "The Annals of the Four Masters says of the end of the struggle that the Danes and their Leinster allies "were afterwards routed by dint of battling, bravery, and striking by Malachy from Tulcainn (Tolka) to Ath-Clinth (Dublin). In the annals of the battle it is called "the battle of the Fishing Weir of Clontarf," which was the mouth of the Tolka, where Ballybough Bridge now is, and the chief point in the Danish defeat appears to be when they tried to cross the Tolka at high water in their retreat on Dublin. Other memories of events connected with the Tolka may be held over for a future occasion.

HOW TO PRESERVE AND RESTORE FLOWERS.

Flowers may be preserved in a fresh state for a considerable time by keeping them in a moist atmosphere. Readers who love to see plenty of flowers in their rooms will be gratified by adopting the following plan:—Pour water into a flat porcelain or glass dish. Set a vase of flowers in the dish and over it place a bell-glass with its rim in the water. The air which surrounds the flowers being confined beneath the bell-glass, is kept continually moist with the water which rises in the form of vapour. As fast as the water is condensed it runs down the sides of the bell-glass back into the dish; and if means were taken to enclose the water in the outside of the bell-glass, so as to prevent it evaporating into the air of the sitting room, the atmosphere around the flowers would remain continually damp. Those who wish to "linger on the beauty" of a rare flower or a bouquet, will be repaid by this experiment. It can be tried on a small scale by inverting a tumbler over a rose-bud in a saucer of water. Another method by which some flowers may be preserved for many months is to carefully dip them as soon as gathered in perfectly limpid gum water, and after allowing them to drain two or three minutes to set them upright or arrange them in the usual manner in an empty vase. The gum gradually forms a transparent coating on the surface of the petals and stems, and preserves their figure and colour long after they become dry and crisp. Faded flowers may be generally more or less restored by immersing their stems in very hot water and allowing them to remain in it until it cools or they have recovered. The cooled portions of the stems must then be cut off and the flowers placed in clear, cold water. In this way a great number of faded flowers may be restored; but there are some of the more fugacious kinds on which it proves useless; but flowers may also be preserved and their tints deepened by adding to the water a little of the solution of carbonite of ammonia and a few drops of the phosphate of soda. The effect of this in giving the flower a deeper colour and a stronger appearance is quite wonderful, and by cutting off every other day about a half-inch of the stems of the flowers with a sharp knife they may be kept so long as their natural life would last.

A FOSSIL MAN FROM KANSAS.

In April last the bones of a human skeleton, including the skull, were discovered in the plain of the Missouri River near Lansing, Kansas, at a depth of 21 feet, beneath a previously undisturbed bed of indurated river alluvium. Prof. S. W. Willesten avers, after an examination of the bones and of the place where they were found by men driving a tunnel, that the fossil represents "the oldest authentic human remains hitherto discovered in North America." He thinks the man was buried by drift during the period of depression following the glacial epoch, in the time of the so-called equus beds, the time of the extinct mastodons, camels and llamas. The cranium of this ancient man appears to be of normal capacity.

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

By CHARLES SMITH, M.D.

Æquum est enim meminisse & me, qui discerem hominem esse et vos, qui Judicetis ut ſi probabilia dicentur nihil ultra requiratis.

VOL I.

The Second Edition, with Additions.

Chapter IV.—Continued.

About four miles west of Castlehaven the sea enters a narrow creek, and forms a fine salt water lake, called Lough-hyne. This lake being surrounded with high hills has a most romantic appearance; it is about two miles in circumference, and in the midst of it is a small island, on which stands the ruins of an old castle built by the O'Driscol's. This lake abounds with various kinds of sea-fish, as also salmon and white trout. Here are excellent lobsters, crabs, escalops, and small deep oysters, which I was assured, instead of having a milky juice in the summer season, as all others have, their liquor seems bloody. At half ebb, this water empties itself into the bay of Barloge, in a kind of waterfall, like the river Thames at London-bridge; seals also breed in this lake. It is the property of Sir John Freke, Bart., who has the opportunity of having excellent sea-fish from it in the most stormy weather. On one side of this lough is an hill, called Knockowne, remarkable for a very fine echo; and a little to the west is the castle of Ardagh, built by the O'Driscols, now also the estate of Sir John Freke.

Three miles more to the west is Baltimore, formerly called Dunashad, an ancient corporation, and an excellent harbour, the S.W. side of which is formed by the island of Sherkin. The first English plantation made here was by Sir Thomas Crook (12), who took a lease of it for 21 years from Sir Fineen O'Driscol. He settled a colony of English Protestants in the place, and procured a new charter of incorporation from King James I. The members consisted of a sovereign and free burgesses. He divided the town into several tenements, with lots for gardens, and gave to each inhabitant convenient land for building and grazing, estating them in leases for his own time; and to encourage them to build and plant, he procured a patent for the town to him and his heirs for ever, and promised to make over to each of the tenants an estate in fee-farm of the proportion he held; but death prevented his undertaking.

After his decease, and before the lease to him was expired, Sir Walter Coppinger, a native of the country, and a recusant, prosecuted a title; and without any of the English inhabitants being called to answer, got, by reference, an order out of the Chancery against the heirs of Sir Fineen O'Driscol; whereby the possession that had contained for 300 years in him and his predecessors, was ordered to be recovered; and thereby the patent of the heir of Sir Thomas Crook was suspended. Upon this, the sovereign of Baltimore, in behalf of himself, the burgesses, and inhabitants, with the heir of Sir Fineen O'Driscol, applied to the Government for relief (13). They proved that they had made a civil plantation of English Protestants there; that his Majesty had incorporated them; that Sir Thomas Crook had showed them a patent, whereby the town was granted to him and his heirs, and that he had promised to estate them and their heirs, in consideration of which they had expended £2,000 in buildings and other improvements; but that Sir Walter Coppinger had got possession of the castle of Baltimore, intended to bring Irish into the place, and remove all the English inhabitants. The Lords Justices summoned Sir Walter to answer this complaint; and all he endeavoured to show was that the inhabitants had not laid out the sum mentioned in their remonstrance. Upon which the Lords Justices issued a commission to Sir William Hull, Mr. Henry Beecher, and Mr. Barham, to examine what expenses the townsmen had been at, and to return them an exact amount of the same; and Sir Walter was dismissed, upon his promise to reinstate all the English, at such rents (upon a return of the valuation) as the council board should think proper. The substance of this return was that the English had erected 60 new houses on the place, and that they had bestowed, in building and enclosing, £1,642 15s. 7d., which account was no sooner given than Sir Walter Coppinger, contrary to his promise at the board, contracted with the above-named Mr. Beecher and granted him a lease of the whole, without any reserve to the inhabitants who had laid out their money; which occasioned another complaint to the Government from the sovereign, and Sir Walter was again summoned to appear, which for some time he postponed, and for his contempt was confined in the castle of Dublin. Mr. Beecher, being one of the commissioners, was judged as culpable as Coppinger, and was sent for to answer before the board. He made his addresses, privately, to the Earl of Cork, then one of the Lords Justices, who advised him either to surrender his lease to Coppinger, so as he might be able to perform his promise, or to estate the tenants during his own term, which last Beecher complied with, but would not give up any part of the fishery, a point the townsmen insisted upon; so that the matter was brought a third time before the council, where many voices were given for Beecher's being committed to the castle. But the Earl of Cork (who was his friend) moved, that since the place was come into the hands of an English gentleman, who had been a favourer of civil plantations, and that the season for fishing was come, they might be all licenced home, where they might amicably make up matters among themselves; which the Lord Chancellor, whose turn was to speak next, assented to, and so the affair ended.

The corporation offered (provided their estates were confirmed to them) to build a pier and erect a fort at their own expense, if his Majesty would give them some ordnance (14). On the 20th of June, 1631, a most terrible disaster happened this colony. In the dead of the night, two Algerine rovers landed their men, and having plundered the place, they made a great number of the inhabitants prisoners, with above 100 English, and carried them all to Algiers. Among others, William Gunter, a person of some credit, had his wife and seven sons carried away, as I find by his petition to the Lords Justices for their relief. Those Algerines were piloted into Baltimore by a Dungarvan fisherman, one Hacket, whom they took at sea for the purpose, and who, for this fact, was afterwards condemned and executed. Two ships of war, called the Lyons Whelps, stationed at Kinsale, received timely notice (as it appeared from one Mr. James Salmon, of Castlehaven) of this intended descent; but they did not stir to intercept them (15).

(12) MSS. in Lismore castle.

(13) From the original petition to the Earl of Cork and Lord Chancellor Ely, lords justices at Lismore.

(14) Original information in the Council Books.

(15) The lord president St. Leger, in a letter to the lords justices, dated the 27th of March, 1632, gives them the following account of the precaution he took to secure the coast against the Turkish pirates.

"I have ordered beacons to be set up on the following head lands and eminences: one at Dundeedy and at Dunworley, to alarm the inhabitants of Ibawne, who, upon the firing of the beacons, are to assemble under arms at Cloghnakilty; so that, if either Ross or Timoleague are attempted, they may readily relieve them. Castle-haven has not many inhabitants, and the harbour was secured by Mr. Salmon, who raised a fort, and mounted ordnance on it. I have ordered beacons to be erected on the promontory over the Dorseys; and by one of his own, the island of Cape Clear, at Missen Head, and one at Sheep's-head point. Mr. Daniel O-Sullivan has a house of reasonable strength at Bear-haven, and takes upon him to defend it and Ballygobbin; he promises to erect five beacons, one upon the Dorseys, and four upon the great island. I have directed O-Sullivan More (who lives in the river of Kinmair), to take warning from the beacon erected over the Dorseys; and by one of his own, to assemble his tenants and servants, at his strong and defenceable castle. But, I think, this precaution needless, as the inhabitants on both sides that river are but few, till as far up as Glanerought, where the pirates dare not venture. At Dingle there are great numbers of honest and well affected people, and a company may be placed there to secure them. Tralee is in the same situation as Glanerought, but freer from danger, by the residence of Sir Edward Denny and Sir Thomas Harris, who are well provided with will, judgment, and arms, to defend themselves. The fort of Castle-Park, near Kinsale, is in a ruinous condition, and the ordnance dismounted; and I humbly pray the same be repaired, as the inhabitants are more in dread of the invasion than those of any other place in this country, etc."

Capt. South, in the Phil. Transact. informs us that, in the year 1698, there were in Baltimore and about it, nine seamen, 188 fishermen, 84 boatmen, in all 281, whereof only two were papists.

The year following (16), Sir Vincent Gooking informed the Lords Justices that the Turks intended another attempt, which they advertised the English Government of; and they observe in their letter that if proper means were not taken to guard those coasts, the pilchard fishery would be entirely ruined, to the great prejudice of his Majesty's customs; adding that pilchards then brought into the kingdom, one year with another, £20,000. Baltimore never recovered itself since this accident; it is now a poor, decayed fishing town, with not one tolerable house in it. Here are the ruins of an ancient castle of the O'Driscols; and it has still the privilege of sending two members to Parliament, though it consists but of a few poor cabins. King James II. granted a new charter to Baltimore, anno 1687, and Daniel O'Donovan, Esq., was appointed portreeve thereof. The late Right Hon. John Calvert, Baron of Baltimore, who was proprietor of the province of Maryland and Avalon, in America, took his title from Baltimore in the county of Longford, and not from this place, as has been mistaken. The church is small, and situated low, at a small distance from the town.

From Baltimore, about five miles up the river Ilen, is Skibbereen, anciently called Stapletown; it was formerly a part of the domain of the castle of Gortnaclough, which belonged to Mac-Carty Reagh; this castle has been sometime entirely demolished, as is also Littertinlis, another of Mac-Carty's castles, E. of this place. Skibbereen is a small market town, where the collector, surveyor, and other officers of the port of Baltimore reside. On the W. side of the river is a new erected church, and in the town a decent market-house. The River Ilen runs through the place over which there is a stone bridge, but so low as to be sometimes overflown by floods; boats, at high water, row down to Baltimore. The clothing trade is followed in this place; they have also some share of the linen manufactory, particularly for striped linens and handkerchiefs, and a good weekly market. Near the town the lands are well cultivated, affording good quantities of corn and flax. They manure with sea-sand, the soil being a grey clay, and in some places red, with a slaty bottom. They have no limestone nearer than Muskery. West of Skibbereen is Abbey Showry, formerly a religious house, but now the ruins of a parish church. In it are several old tombs, and, in particular, a large one of the Roches.

Affadown, the seat of Col. Beecher, three miles W. from Skibbereen, is adorned with good gardens and plantations. The jaw-bone of a whale forms the side posts and arch of a gateway large enough for a coach to drive through, although some part is buried in the earth. Near it, on a rising ground, is a round tower; on its top is a lanthorn, from whence is a prospect of the adjacent coast and islands, with the ruins of several old castles.

About a mile S. is White-hall, called formerly Rincolisky, a good house of Samuel Townshend, Esq., pleasantly situated on an arm of the sea. The castle of Rincolisky belonged to the Coppingers, but it was originally built by the O'Driscols. To the W. of Rincolisky is a broad, deep bay, called Roaring-water bay, and, in Irish, Lough Trasnagh; at the head of the bay are the ruins of the castle of Kilcoe, built by the Mac-Cartys, a branch who styled themselves Lords of Clan-Dermot. They had also the castle of Cloghan. More to the west, opposite Horse-island, is the ruin of the castle of Rosbrin, which belonged to O'Mahony, being boldly erected on a rock which hangs over the ocean. The proprietor of this castle, in Queen Elizabeth's time, turned pirate; which caused the Lord President, Sir George Carew, to demolish it, and the W. side is battered to the ground. There is an ancient Irish MS. called, from this place, the psalter of Rosbrin, and contains little else than a genealogical account of this family of the O'Mahonys. Two miles more W. are the ruins of Ardintenant castle, the chief residence of O'Mahony, of W. Carbery, seated near the eastern point of Skull harbour. Skull is but a small, insignificant village, having few buildings besides the church and parsonage house. To the N. of it stands an high, conical hill, called Mount-Gabriel; on the top of it is a remarkable lough, which is but a few yards broad; it has been sounded from the N.E. with 100 fathom of line; although the lead stopped, yet the hole was deeper, it being choked up with a long, coarse grass, which the Irish call fenane. The water oozes out of the mountain to the N.W., and this cone is above 300 yards higher than the level of the sea; from it is a noble prospect of a vast extent of a rude, uncultivated country, from the Mizen head to Ross, with an infinite number, as Milton says,

> ———Of sea-girt isles,
> That, like to rich and various gems, inlay
> The unadorned bosom of the deep.

As also several bays, creeks, and harbours, which I shall particularly describe in another place. The mountains are here thrown together with such irregularity and confusion as to form a great variety of hollow bottoms, that often represent the figures of many artificial basins, where, if any springs chance to rise, they produce several lakes before they can find issues for the waters, or otherways constitute so many impassable turf bogs. Between the Leap and Skibbereen are many loughs, stored with trout and eels, which the Irish call aghills; and some have small floating islands, which swim from one side to the other: I have seen of them above ten yards broad; they are usually composed, at first, of the above-mentioned long grass, which gathering together by degrees, being blown off the adjacent grounds in September, form a kind of a tussock, and increase every year, by the addition of slime and other matter that they collect in floating about the sides and edges of the lakes. In the parish of Kilmacabea is a lake, called Loughdrine, which the country people hold to be miraculous, and say that on a certain day of the year all the islands in it change places and shift from one side to the other; at which time vast numbers of people assemble at this lough, where they erect booths, and feast, everyone bringing bits of bread, meal, &c., to feed the fish in the lake..

In the same parish is another, called Ballinlough, stored with a fine, large, red trout; on an hill, to the E. side of it, is an ancient Danish entrenchment, said to have a subterraneous passage down to the lake. In this and several other loughs are several fresh water wrinkles, exactly resembling those on the sea shore; and as mussels and other kinds of sea shell-fish are often found in fresh water, I do not wonder that we often discover varieties of shells in places remote from the ocean.

(To be Continued.)

DETECTING BLOOD STAINS.

A new method of distinguishing human blood stains is now being employed with some success. It is the practical result of the experiments made by Bordet in 1898-99. He showed that by injecting defibrinated blood of an animal into animals of different species, the serum of the latter animals acquired the property, after a certain time, of agglomerating and dissolving the red corpuscles pertaining to the species whose blood had been injected. The serum thus obtained has been called cytolitic. He also showed that this serum, when mixed with defibrinated blood of another species, furnished at the end of a few minutes a red liquid, clear and limpid, while if added to the serum of the first animal whose blood had been used to prepare the cytolitic serum it gave an opaque liquid which soon formed a flaky precipitate. It is this observation which Uhlenbach has applied to the diagnosis of human blood. He injected every six or eight days about 10 cubic centimeters of defibrinated beef's blood into a rabbit, and after five injections he obtained a serum which dissolves beef's blood exclusively. By taking a one per cent. solution of the blood of 18 different animals and adding six or eight drops of the serum obtained from the rabbit, he found that all the tubes except that containing the beef's blood remained perfectly limpid, while the latter became cloudy and gave finally a woolly precipitate. A series of similar experiments upon human blood gave the same results, and he was able to distinguish between the former and beef's blood in samples which had been dried for over a month. The researches of Wassermann and those of Schultze, in which human blood has been compared with that of 23 different animals, confirm those of Uhlenbach, and the precipitate was obtained only with human blood; one exception must be made, that of monkey's blood, which at the end of a certain time gave a very slight precipitate. The method is very efficacious, and blood which is three or four months old may be detected in this way, where other methods fail. The experimenters state that the material of the blood stain to be examined should be soaked in a small quantity of a normal salt solution, and after filtering, the liquid is divided in equal parts in two test tubes. To one is added a few drops of the serum of a rabbit which has undergone the treatment with human blood, and to the second the serum of an untreated rabbit. A third tube contains diluted blood of another kind of animal, and to it is added another portion of the serum of the first habbit. The tubes are kept at 37 deg. C. and if at the end of an hour the contents of the first tube become cloudy and then precipitate while the other two remain clear, it is certain that the spot is that of human blood, except in the remote case where monkey's blood might be considered.

ASTRONOMICAL OBSERVATIONS.

PHOTOGRAPHY AS AN ADJUNCT.

In late years the photographic plate has become as essential an implement of the astronomical observatory as the telescope itself. The place can see much more through the telescope than the human eye. The reason is evident. When an astronomer is watching a certain star through his telescope, the rays of light which are emitted from that star only make a momentary impression upon the retina of his eye. They have hardly excited the optical nerve, when this effect is wiped out again and the eye made ready for a new impression. The sensitive plate, however, acts differently. The successive impressions made upon it by a luminous body remain, and added to each other increase in strength with the time of exposure. If, therefore, a plate remains exposed, say for hours, the object, however faint, will finally leave some impression upon the plate, and hence the great advantage of the camera for astronomical observations.

Not only have large numbers of stars and nebulae be discovered by means of photography, but the structure, too, of many celestial objects, particularly the nebulae, has now been revealed in a degree which surpassed all expectations.

Thus, for instance, a nebula was discovered some time ago which had never before been visible through any telescope. Photographs of this nebula were taken night after night, and by comparing them it was found that the nebula changed its form from time to time. New discoveries as to the form of the nebulae have also been made by photography. Photographs taken by a two-foot reflector show that the nebulae are not diffused, hazy masses, but that their structure is most complicated, often consisting of exquisitely fine filaments and delicate narrow rifts. In these photographs the inter-sections of such filaments and rifts can be set in the measuring machine with almost the same accuracy that is possible in the case of star images.

The nebulae of luminous clouds are altogether different from what we call stars, or star clusters. They are immense accumulations of luminous matter of a very subtle kind. As their light is very faint, they escape the ordinary observation; in fact, out of the eight thousand nebulae which have thus far been discovered, only two or three are visible to the naked eye. They are very different in form. Some of them exhibit a remarkable spiral structure, while others, called "ring nebulae," are circular with a dark spot in the centre. Again others are very irregular in form, sending out sprays and streams in all directions, and contain dark openings or lanes. With regard to the size of the nebulae so much, at least, can be said that, on the whole, it far exceeds the diameter of the largest known fixed star. Some, indeed, are so enormously large that the entire solar system, Neptune included, could easily move within them. And yet the diameter of Neptune's orbit is five billion miles. It would take an express train travelling at the rate of sixty miles an hour ten thousand to fifteen thousand years to go from one end of such a nebulae to the other.

The difference between the eye and the photographic plate, mentioned above, which speaks in favour of the plate in a few extreme cases, is due not to a defect, as it may appear, of the human eye, but rather to one of its greatest perfections. For should the impression of a luminous object which we are looking at remain longer than a moment, it would badly interfere with the vision of another object at which we are looking right afterwards. If the impression of the things seen around us were not wiped out immediately, we should see a hundred different pictures at the same time, mixed together in a great confusion, and our eyes would be practically as useless as a photographic plate becomes when more than one picture has been taken on it by mistake. To the honour of the eye and its Creator it must be said that it is the most wonderful photographic camera ever devised. It is not only furnished with rapidly closing shutters, the eyelids, with an automatic, self-adjusting lens and diphragin, with a sensitive film, which is acted upon and developed instantly so as to represent the most delicate details with colour and all, but it is given to us in pairs and set in such a way that we are able to take stereoscopic pictures of the objects around us, and each one of the two is kept in good working order for years and years, is cleaned, repaired, lubricated automatically, requiring only a minimum care on our part for its preservation; not to speak of the marvellous vital process, which raises all these operations to a higher order, so that we become conscious of the world around us, and "see" the things as they are, not the impressions which they cause. Indeed, the eye alone is a stringent proof that there exists a wise Creator.

THE FISHERMEN OF WEXFORD.

BY JOHN BOYLE O'REILLY.

There is an old tradition sacred held in Wexford town,
That says:—"Upon St. Martin's Eve no net shall be let down;
No fishermen of Wexford shall, upon that holy day,
Set sail or cast a line within the scope of Wexford Bay."
The tongue that framed the order, or the time, no one could tell;
And no one ever questioned, but the people kept it well.
And never in man's memory was fisher known to leave
The little town of Wexford on the good St. Martin's Eve.

Alas! alas for Wexford! once upon that holy day
Came a wondrous shoal of herrings to the waters of the bay.
The fishers and their families stood out upon the beach,
And all day watched with wistful eyes the wealth they may not reach.
Such shoal was never seen before, and keen regret went round—
Alas! alas for Wexford! Hark! what is that grating sound?
The boats' keels on the shingle! Mothers! wives! ye well may grieve;
The fishermen of Wexford mean to sail on Martin's Eve.

"Oh, stay ye!" cried the women wild. "Stay!" cried the men white-haired;
"And dare ye not to do this thing your fathers never dared.
'No man can thrive who tempts the Lord!" "Away," they cried "the Lord
Ne'er sent a shoal of fish but as a fisherman's reward."
And scoffingly they said, "To-night our nets shall sweep the Bay,
And take the Saint who guards it, should he come across our way."
The keels have touched the water, and the crews are in each boat;
And on St. Martin's Eve the Wexford fishers are afloat.

The moon is shining coldly on the sea and on the land,
On dark faces in the fishing fleet, and pale ones on the strand,
As seaward go the daring boats, and heavenward the cries
Of kneeling wives and mothers, with uplifted hands an eyes.

"Oh, Holy Virgin! be their guard," the weeping women cried;
The old men, sad and silent, watched the boats cleave through the tide,
As past the farthest headland, past the light-house, in a line
The fishing fleet went seaward through the phosphor-lighted brine.

O, pray, ye wives and mothers! All your prayers they sorely need
To save them from the wrath they've roused by their rebellious greed.
Oh! white-haired men and little babes, and weeping sweethearts pray
To God to spare the fishermen to-night in Wexford Bay.

The boats have reached good offing, and as out the nets are thrown,
The hearts ashore are chilled to hear the soughing seawinds moan:
Like to a human heart that loved, and hoped for some return,
To find at last but hatred, so the seawind seemed to mourn.

But ah! the Wexford fishermen their nets did scarcely sink
One inch below the foam, when lo! the daring boatmen shrink
With sudden awe and whitened lips and glaring eyes agape,
For breast-high, threatening, from the sea uprose a Human Shape!

Beyond them, in the moonlight, hand upraised and awful mien,
Waving back and pointing landward, breast-high in the sea 'twas seen;
Thrice it waved and thrice it pointed, then with clenched hand upraised,
The awful shape went down before the fishers as they gazed!

Gleaming whitely through the water, fathoms deep they saw its frown,
They saw the white hand clenched above it,—sinking slowly down!
And then there was a rushing 'neath the boats, and every soul
Was thrilled with greed; they knew it was the seaward going shoal.

Defying the dread warning, every face was sternly set,
And wildly did they ply the oar, and wildly haul the net;
But two boats' crews obeyed the sign, God-fearing men were they,
They cut their lines and left their nets, and homeward sped away;
But darkly rising sternward did God's wrath in tempest sweep,
And they, of all the fishermen, that night escaped the deep.
Oh, wives and mothers, sweethearts, sires, well might ye mourn next day;
For seventy fishers' corpses strewed the shores of Wexford Bay.

TO CLIMB EARTH'S HIGHEST PEAKS.

The mighty peaks of the Himalayas, several of which rise far above the loftiest elevation attained by any other mountains on the globe, have long challenged the mountain-climber with impunity. Sir Martin Conway got to the top of one, 21,000 feet in height, in 1892, but the real giants rise more than a mile above that level. Now Dr. Jacot-Guillemot, with a party of two Austrians and three Englishmen, has started for India to attempt the ascent of Mount Godwin-Austen, formerly known as Mount Dapsang. If he succeeds in this attempt, he may yet try higher peaks. The highest climb on record is Fitzgerald's ascent of Aconcagua in the Andes, about 23,000 feet.

LITERARY NOTES.

The last was a week of obituaries. Three distinguished names—distinguished in very different ways—have been erased from the roll of the living—Professor Cowell, Sir Charles Gavan Duffy, Edna Lyall. Professor Cowell was one of the many men of whom the universities are honourably proud; he did his work to the utmost of his power, and devoted his gifts to helping younger men. When he became Professor of Sanskrit at Cambridge active steps were at once taken to promote an intelligent study of Oriental languages. First came the Semitic Languages Tripos in 1878; then, in 1893, the Indian Languages Tripos, and in 1895 the Oriental Languages Tripos. He gave Edward Fitzgerald Spanish lessons by way of the plays of Calderon, and it was he who brought to England the manuscript of the "Rubaiyat," and translated it to the wise Woodbridge recluse. In thinking of Fitzgerald's immortal rendering of Omar, Cowell's name should never be forgotten.

✧ ✧ ✧

Sir Charles Gavan Duffy was a man of a very different type; his enthusiasms took shape in action. At first he was associated with that spirited revolutionary party known as the Young Ireland Party, and he, with Thomas Davis and John Blake Dillon, founded the "Nation." The dead statesman's career has been the subject of many long newspaper articles during the past week, and we need not enlarge at any length in this place upon the position he occupies as a writer. Let it suffice to say that Sir Charles Gavan Duffy wrote on many subjects, and always with a certain grip and enthusiasm. Two of his best known books are his "Conversations with Carlyle" (whom he knew intimately), and "My Life in Two Hemispheres."

✧ ✧ ✧

The "Atlantic Monthly" prints a buoyant article on "The Literary Pilgrimage." Authors, says the writer, will for ever go a-pilgriming:—

An eternal type is this roadster of letters, successively reincarnated and with such singular persistence that thence comes a farm from incurious question: to find out what aim bids the sensitive author run hazards so dire. I note many aims, each good in itself,—or if not good, then at least serviceable and worthy of sympathetic consideration. See: they are these,—the love of truth, the love of art, the love of right, the love of men, the love of self. And however glib the scribe's plea that he serves but one lord, I must answer he serves all five; however distinctly he announces himself or ths or that and none other, I nevertheless declare him five fellows at once. He is scientist, poet, preacher, philanthropist, and blatant self-trumpeter.

✧ ✧ ✧

Thus, with his staff in hand, the literary pilgrim takes the road; he sees villages, towns, the broad country, the intricate alleys, and in circumstances he observes men and things Yet his life is not all joyous:—

The life is the life of the vagrant. For a thousand friends you have not one intimate. In a hundred cities men shout at you cheerily. "Why, man alive! where ever did you drop from?"—and then suggest birds and bottles, yes and pay for them! but the old friends,—the tried, faithful time-tested, long-loved comrades and yoke-fellows—these the literary seven-league-booter doesn't have and can't get. Nobody calls him by his first name. There are no babies named for him, and if he wanted to borrow fifty dollars, I don't know whose door he'd knock at.

And at the end comes weariness; the world-strangeness wears dull." Yet it was worth while, for a tthe end the pilgrim says:—

"I have fought a good joust, said my say, tried with what grace there was in me to interpret the world movement, and so to accelerate it." And when the din of the fray is stilled forever, and the last weapons laid down, and the troopers themselves put to rest and he with them, there will yet remain his testimony of whatever he saw and heard in the world,—a record of which history will one day make use; for he in his time did portray with candid, fearless truth the life men lived, the thoughts they thought, and the works they laid hand to.

✧ ✧ ✧

The "Author" is apparently not inclined to extend to aspiring amateurs quite the open-hand that was extended to them by Sir Walter Besant. In the current number it goes to Mr. Marion Crawford's novel, "The Three Fates," for a portrait and a denunciation of "ink-drunkards." Theirs must be a "black list" indeed. In Mr. Crawford's words, they "have looked upon the ink when it was black and cannot be warned from it, and their nostrils have smelled the printer's sacrifice." And then we have the "Author" comparing ink-drunkenness to that produced by opium, chloral, or morphine, with terrible results to those "beings who are rendered objects of pity to their friends and of despair to themselves by an insatiable desire to write."

✧ ✧ ✧

The ills the writer is heir to include "poverty, despair, heartsickness," not to mention a morbid industry. Since, however, we have actually mentioned it, here is Mr. Crawford's warning under this head:—

Let a writer work until his brain reels and his finger can no longer hold the pen, he will nevertheless find it impossible to rest without imagining he is being idle. He cannot escape from the devil that drives him, because he is himself the driver and the driven, the fiend and his victim, the torturer and the tortured.

✧ ✧ ✧

Certainly, the anxious father or friend who wishes to frighten away boy or girl from literature as a means of livelihood has not far to look for the "awful example" in literature. At this moment two books are newly published in which bitter things are said of the literary life. Robert Buchanan declared that he would rather see a son of his dead than see him take to literature. Mr. Gissing's book, "The Private Papers of Henry Ryecroft," has for one of its burdens and refrains an exultant escape from that New Grub street which Mr. Gissing drew such a powerful picture years ago. Henry Ryecroft writes in his diary:—

With a lifetime of dread experience behind me, I say that he who encourages any young man or woman to look for his living to "literature," commits no less than a crime. If my voice had any authority I would cry this truth abroad wherever men could hear. Hateful as is the struggle for life in every form, this rough-and-tumble of the literary menu seems to me sordid and degrading beyond all others. Oh, your prices per thousand words! Oh, your paragraphings, and your interviewings! And, oh, the black despair that awaits those downtrodden in the fray.

✧ ✧ ✧

Meanwhile, the whetting of literary appetites goes on. We are given in one quarter a long list of novelists who live in the country, far from the madding crowd, and visions of their rural independence are called up. Elsewhere the town-pent literary aspirer is told that it is becoming more and more the custom for authors to migrate in the winter. Mr. Kipling is at the Cape, Mr. W. E. Norris is on the ocean, Mr. Eden Phillpotts and Mr. Arnold Bennett are in Algeria, Mr. Mason is in Morocco, Mr. Zangwill fleets the time on the Riviera, and Mr. Barry Pain starts for Egypt next week. Who does not want to be an untethered novelist?

✧ ✧ ✧

Upon the borderland of literature lies the drama; and though its potentialities as a political instrument have never been entirely ignored, they have seldom been realised in practice. Nevertheless, there are a few historical examples on record of the drama turned to political ends. It is impossible to doubt that when Dryden wrote his "Amboyna" for the stage he was instigated by the Government, who wished to inflame national antipathy towards the Dutch before declaring war against them. One of the most curious incidents in English history was the political feeling aroused by Addison's "Cato." As a staunch Whig, and as a friend and associate of the great Whig officials, it is possible that Addison intended to perform a party service in the production of this patriotic play. But however, that may be, both Whigs and Tories resolved to turn it to account; both claimed its sentiment as peculiarly their own. Pope, in one of his letters, describes how upon its first night at Drury Lane "the numerous and violent claps of the Whig party on the one side of the theatre were echoed back by the Tories on the other," and how Bolingbroke, between the acts, sent for Booth, who played the part of Cato, and gave him fifty guineas for so ably defending the cause of liberty.

✧ ✧ ✧

At the time when it has become a popular literary pose to declare that Charles Dickens has ceased to be appreciated by the reading public it is interesting to find that dramatic adaptations of the novelist's works are to be the fashion in the London theatres during the coming season. Whatever the literary critics may say, the theatrical people, whose chief business it is to judge the public mind, do not believe that Dickens has lost his hold on the understanding and appreciation of the people. Indeed, with surprising unanimity they seem to have come to the conclusion that at the present moment Charles Dickens is a winning card to play. Several ambitious schemes for the dramatic presentation of Dickens's novels are already announced. The most ambitious and enterprising is perhaps that of a syndicate of London actors, with Mr. Charles Cartwright at the head, who are venturing their own money on a series of Dickens' adaptations to be played at matinees at a West End theatre. The strongly-marked characterisation of the great London story-teller appeals naturally to the actor, and in each of the novels there are sufficient good characters to go round. "David Copperfield," for instance, which will probably be the first of the syndicate series, is full of good character parts, as also is "Barnaby Rudge," which will probably be the second of the series of adaptations.

✧ ✧ ✧

This syndicate will not rely upon the existing dramatic versions, of which some were very hurriedly done, and others were prepared with special thought for the requirements of some actor-manager. Instead, an entirely new series of adaptations has been arranged for. Mr. Ben Landeck, one of the most ingenious and successful of the younger stage authors, has been commissioned to prepare the acting versions. At the Grand Theatre, Islington, another series of Dickens' plays is to be produced, with "Little Nell" as the opening piece. But a still more notable Dickens play to be shortly seen is Mr. Comyns Carr's version of "Oliver Twist," to be produced by Mr. Tree, with that distinguished actor in the striking part of Bill Sykes. Mr. Wilson Barrett also, always quick to see the tendency of popular appreciation, is contemplating playing the effective part of Ham Peggotty in an adaptation of his own of the "Little Em'ly" portion of "David Copperfield." And there are rumours of several other Dickens ventures. So many people are considering Dickens' plays that the stock of copies of the versions made by Andrew Halliday and other adapters has been sold out. The explanation of the Dickens revival is to be found in the great successes which have been made by Mr. Martin Harvey as the hero of "The Tale of Two Cities," and by Mr. Bransby Williams in a series of Dickens character impersonations he has given in the music-halls. It was the ready recognition given by the music-hall public to the characters Mr. Bransby Williams reproduced which suggested to the syndicate of actors before-mentioned the continued popular attractiveness of the great novelist's works.

SCIENTIFIC TOPICS.

One of the latest long-distance and high-speed electric railways is between Seattle and Tacoma.

✧ ✧ ✧

The new U.S. cruiser "Baltimore" will be the first warship to be fitted with steel furniture. Naval Constructor Capps and his assistant, Constructor Nutting, have found that all the essential furniture of a man-of-war can be made of steel. The reason for the use of steel furniture is to be found in the fact that serious damage was done during the war with Spain by the furniture on the ships taking fire.

✧ ✧ ✧

The New York Aquarium added to its collection on December 10 a snapping turtle which was one of the best ever seen in captivity. Unfortunately, the creature died three days after it was received. It was a Mississipi snapper, and measured from the point of its beak to the tip of its tail 4 feet, 7½ inches. Its upper shell was two feet long. The total weight of the animal was 106 pounds.

✧ ✧ ✧

The value of waterfalls has greatly increased since the electrical era (says the "Mining and Scientific Press"). Time was when a cataract was valuable only for scenic purposes, but now it is useful as well as ornamental. Niagara is worth one thousand million dollars more as a source of electrical power than merely as a sight. California waterfalls are increasing in value in a commensurate degree. Snoqualmie Falls, in Washington, has enhanced in value 5,000 per cent. in the last few years.

✧ ✧ ✧

Professor Ferdinand Braun, of Strasburg University, announced before the Strasburg Scientific Society that he has discovered a method of producing electrical energy of unlimited volume and projecting it into space in the form of electric waves to any desired distance. Professor Braun claims that his new method secures greater accuracy of transmission in wireless telegraphy, and that he attains a more perfect attunement of transmitting and receiving instruments.

✧ ✧ ✧

The artist, J. F. Raffaelli, now in Paris, has devised a means of solidifying colours so that superior effects can be secured without the use of the palette and brush. It is also stated that the new method has the advantage of rapidity. An exhibition of seventy-two works of various character, done by twenty different artists, was held recently at the Durand-Ruel gallery in Paris, and attracted a great deal of attention, not only because of the novel method by which they were made, but because of the excellence of the results attained.

✧ ✧ ✧

Some experiments made by H. Schoentjes, of Ghent, with double glazing for windows, which is sometimes adopted with a view to reduce loss of heat, show that there is a certain distance of separation between the glasses at which the heat lost is a minimum. The glass used in his experiments was 2 millimetres (.079 inch) thick, and the loss was least when the distance between the opposing sheets was somewhere between 67 millimetres and 117 millimetres (2.64 inches to 4.61 inches). With double walls at the best distance apart the rate of loss as compared with single walls was about halved.

✧ ✧ ✧

Miss Ida May Fuller has brought a suit for infringement against Messrs. Gilmore and Thompson, of the New York Academy of Music, and Frank McKee, manager of the "Ninety and Nine" Company, which filled a date at that house recently. The alleged infringement consisted of the use of a device by which the flames are realistically imitated by the use of widths of silk, moved by the action of a rotary fan, the illusion being heightened by the coloured lights from a limelight. One of the thrilling scenes of this performance is the passage of an engine through the leaping flames, going to the assistance of some fire-stricken pioneers.

✧ ✧ ✧

The manufacture of lightning rods has declined to such an extent that the business has almost been lost sight of. There appears to be no mention of it in the American census reports, there being no reports of any output of this character made by any electrical manufactory, and only one firm of electrical engineers announces the design of lightning rods as a part of their business. Lightning strokes are reported to be more rare, especially in the cities, where there are such an abundance of electrical wires which serve to protect the surrounding properties.

✧ ✧ ✧

Mrs. Sarah Wood Clarke, of New York, is the inventor of a device which is said to greatly increase and improve the sound of the piano. There was recently given a demonstration of the improvement at one of the leading hotel ballrooms of New York. The device is a shell-shaped construction placed inside the lid of a grand piano, and when this is opened as usual for a performance the shell acts as an auxiliary sounding board, improving the tone of the instrument and increasing its volume.

✧ ✧ ✧

A. A. Phibbs, who is the inventor of a self-heating branding iron, has just returned to his home in Denver, Col., after a trip through all the principal countries of Europe in the interests of his invention. Although this method of branding was introduced only a short time ago, it is now being widely adopted through the West. The device consists of a copper brand on the end of a steel tube. The latter acts as a reservoir for gasoline, which is turned into gas and burned inside the branding metal, which is thereby kept hot constantly. The self-heating branding iron is now patented in fourteen countries.

✧ ✧ ✧

A paper improvement is announced from Chicago, by which the strength of the paper is greatly increased. This process was worked out by Dr. John Weisner and Adolph Gehrman, both of the Columbian Laboratory. The latter was until recently the City Chemist connected with the Health Department. The process is not ready to be announced, but Dr. Weisner says they have gone far enough to say positively that they have discovered a formula by which the strength of all paper can be increased four or five times by the addition of some chemicals while the paper stock is in the course of manipulation.

✧ ✧ ✧

Last spring Governor Odell, of New York, appointed a commission to inquire into the necessity for establishing a State Electrical Laboratory in connection with the Union College of Schenectady. The commission has completed its report, and recommends an appropriation of 275,000 dollars for buildings and electrical equipments. The laboratory is to supply information on questions of electrical science, and an official standard for electrical measuring instruments and apparatus, together with standards for electric wiring of buildings for the protection of the municipalities and the general public. Such a laboratory has been established in Germany, and has proved a success.

✧ ✧ ✧

A hollow axle for railroad cars is being made by the Howard Axle Company, of West Homestead, Pa., which concern is controlled by the Carnegie Company. For the purpose of fully determining the value of this innovation, the axles are being fitted to one of the pressed steel cars of the latest design, which after six months of service will be examined and compared with another car, fitted with the solid axle, which has been in the same service. The axle is being made under the Merader patent, and the advantages claimed for it are less weight, lower cost, and greater service. The manufacture of the hollow axle is a much simpler operation than that of the solid axle.

✧ ✧ ✧

A new steam yacht in New York waters is the "Revolution," which was built at the works of the Charles L. Seabury Company, at Morris Heights, to demonstrate the adaptability of steam turbines to commercial marine purposes. The engines are the design of Charles C. Curtis, and the boat is 178 feet over all, 16½ feet beam, and 7 feet draught. While the boat was not built for speed, she has shown herself to be one of the fastest crafts in the waters around New York. The "Arrow" of Charles R. Flint, which has a reputed speed of 39 knots an hour, barely beat her in a three hours' run, and the turbine boat pulled all around the "Monmouth," which is said to be the "Arrow's" second.

✧ ✧ ✧

A very startling instance of the deterioration of leather, produced under conditions demanding quicker tanning by the use of various chemicals, thus decreasing the durability of the material, is afforded by the fact that the British Museum expends £4,000 a year in rebinding books in leather. Modern leather is widely different from the material produced by what is now regarded as an effete process, its life being limited to fifteen years. In the search for cheaper and quicker processes of making leather, large quantities of sulphuric acid are used, and this chemical, in combination with others, causes the material to decompose rapidly in the course of a few years.

✧ ✧ ✧

The work on the other branches has not yet been completed. On this road motor cars and trailers are used, and trains are generally made up of two motor cars and two trailers. An electric locomotive is also used for freight and postal cars, and several new locomotives are to be built. At last accounts there were 32 trains running over the Milan-Varese section, among which were seven direct trains which made but one stop between the terminals and cover the 44 miles in 53 minutes. In view of the success of the recent tests and the completion of the new branch, the project for electric traction from Naples to Rome, which has been discussed for some time, is being actively taken up. Besides this, there will be several branches such as Velletri-Terracina and others in the South of Italy. The extensive system which is contemplated will take a large plant, this being estimated at 40,000 horse-power, of which the Naples-Rome system alone will require 25,000. A number of hydraulic plants are to be erected to supply the roads, and these will use the falls of the Liri and the Volturno, as well as the Anione, the Pescara, and several other streams.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

DUBLIN, TUESDAY, SEPTEMBER 25, 1787.

A bank, we are informed, is about to be established at Newry, to open in January next, and to be conducted on the same plan as that of Belfast.

Friday last six pieces of ordnance and two covered waggons were escorted from the Castle of Dublin to Chapelizod by a party of the Royal Artillery, preparative to the field practice and grand review of the present garrison. And there is every reason to conclude that the exhibition will be very grand and curious from the fine appearance of the men with their new uniforms, arms, and accoutrements; and also from the elegance and ingenuity of the plan, which, we are told, will be an attack and defence, from the Park-gate near the Circular road, to Castleknock.

On Monday next, the 10th of October (the usual day of induction falling on Sunday), Alderman William Alexander will be sworn into the office of Lord Mayor, at Dublin Castle, before his Grace the Duke of Rutland; after which William Humphrey and Brent Neville, Esq'rs., will be sworn into the office of High Sheriffs.

The Lord Mayor-elect is, we hear, to give a most sumptuous entertainment on the above day to his Grace the Lord Lieutenant, the nobility, and gentry.

Further accounts, in respect to the storm, mention that a great number of deer-skins have been driven in at Killiney Bay, which makes it apprehended that some American vessel has been lost not very far distant from that quarter; and another account mentions that several hogsheads were seen floating off the coast of Wicklow, which confirms the idea of further disasters by the storm.

A number of the military have been sent down to protect the Bordeaux vessel lately driven on the North Bull, which was chiefly laden with butter, a great deal of which is already recovered, and it is expected the whole will be got off without damage.

Early yesterday evening three post-chaises, with passengers, and a gentleman's carriage, were stopped on Donnybrook road, and robbed by a gang of villains to a considerable amount. Two hackney carriages were in the like manner stopped near Baggotrath Castle, and robbed.

Sunday night the house of Mr. Robinson, of Crampton court, public notary, was robbed of plate and wearing apparel to a considerable value, by a man whom the maid-servant brought in to spend the evening with her, unknown to the family; about twelve o'clock Mr. Robinson, not knowing of any person being in the house, locked up the doors and went to bed; in a short time after, the fellow wanting to go home, found he could not get out, but, however, broke open the doors, and made his escape with the booty abovementioned; the girl gave information where the fellow might be found, and he has, we hear, been taken and committed to the New Prison.

His Grace the Duke of Rutland has visited the ancient town of Galway, and the Corporation presented to him a most loyal and affectionate address, accompanied with the freedom of that town in a gold box. In the course of his Grace's tour he has also visited Birmingham, the elegant seat of Lord Louth, and was, when the last accounts came away, at Mr. Martin's, where, it is said, the elegant and rational amusement of private dramatic entertainments is exhibiting with the greatest eclat, and that Mrs. R. Martin has performed several characters in such a style as scarcely to be equalled on any stage.

On the Chapelizod road a most daring gang made their appearance on Saturday and Sunday nights, and committed several robberies; some of them were very closely pursued, but effected an escape near Mr. Gile's livery stables. It is, however, a very happy circumstance that several of them are known, and we doubt not but the accustomed vigilance of the Commissioners of Police will cause their officers and guards to use their utmost exertions to bring these different gangs of robbers to public justice, and timely extirpate such a set of desperate miscreants, who otherwise must prove of the most terrifying and fatal consequence to the public.

LIMERICK, SEPTEMBER 24.

Saturday the Right Hon. Henry Grattan and his lady arrived in this city from Killarney.

About the hour of ten o'clock last night, Mr. Andrew Vokes, of Ballynecurra, was stopped by two footpads armed with pistols, near Mr. Fennessy's Nursery, who robbed him of his watch and some cash.

BELFAST, SEPTEMBER 24.

In the storm of Thursday night last, we are sorry to hear that the "Hillsborough Packet," Captain Veacock, from Fortpatrick to Donaghadee, not being able to make the Pier, from the violence of the gale, was driven upon the rocks, near the town, and went to pieces. Though there were several passengers on board, providentially no lives were lost.

CORK, SEPTEMBER 24.

The Merchants, Traders, and Citizens, having met the Mayor this day at the Council Chamber, in consequence of his requisition to them, to consider of renewing their application to Government for establishing Mail Coaches between Dublin and Cork, and Cork and Waterford, it was unanimously resolved: "That a memorial to his Grace the Lord Lieutenant should be immediately prepared, to be signed by the Mayor, Sheriffs, Merchants, Traders, and Citizens, which will be sent to the Coffee-house to-morrow, at twelve o'clock, for their signatures; after which it will be forwarded by the Mayor."

We hear that a Privy Council will shortly be summoned for the purpose of carrying into consideration the expediency of establishing mail coaches on the three principal roads from Dublin to the extremities of the kingdom—that is, to Cork, Belfast, and Galway.

WHITEBOY INTELLIGENCE.

On the night of February, the 14th inst., about 200 of them, mounted and armed, went to the house of John Murphy, steward to Mr. John Casey, of Flower-hill, in the North liberties of this city, and obliged him to swear that he would inform his master, from Captain Right, "That if he did not turn out his tithe of hay for the Clergyman, which he had drawn in, and if he should take any more tithe whatever, they would hough his cattle, and otherwise injure him. On the same night one stack of barley, the property of John Dinan, farmer, and one stack of wheat, the property of the Widow Hurly, near Youghal, were burned. On the night of the 16th, they cropped a horse, at Raghduganig, in this county, which had been the preceding day employed in drawing the impropriate tithes of Dunmahon parish. On the night of Monday last they burned a large stack of corn on the lands of Ballinvriskig, in the North liberties, the property of Mr. Robert Parker, whom they suspected for buying his tithe, as he had threshed part of his corn. On the night of Tuesday last they cut off the ears of an horse, the property of John Creedon, of Shronagire, in the parish of Clonedrehad, in the barony of the west division of Muskerry, who had taken his tithe. On the same night they came to the houses of — Sheehan and—Murphy, farmers, near the Ovens, and burned a particle of tithe-corn which they had bought even under the Whiteboy prices. Last Wednesday night, from 30 to 40 of them, went to the house of Mr. John Archer, of Rathrout, parish of Ballinadee, to warn him against taking any tithes. They demanded a gun, and on his refusal to give it, one of them proposed to break open his door, but being informed that he was well prepared to receive them, they desisted. They then went to the house of the Rev. Mr. Weekes, curate of the parish, and fired several shots, which greatly terrified his family, and Mrs. Weekes having appeared to them, they also warned her and her family, under severe penalties, not to have anything to do with tithes. They went to several other houses in the parish, and left threatening letters in them, and afterwards proceeded to the house of Luke Murray, proctor to the Hon. and Rev. Mr. Jocelyn, rector of said parish, and obliged him to come out of his house to them, when they instantly knocked him down, dragged him with a rope a considerable way, and then horse-whipped him in so cruel manner, that he lies dangerously ill, and told him, if he had in future anything to do with tithes, they would put him to death.

CORK SEPTEMBER 24, 1787.

On Saturday evening last, as Mr. John Blake (one of the constables for the barony of Barrymore) and Corporal Baker, with a party of the 47th Regiment, were conducting one Kelly to the county goal, by virtue of a warrant and committal from Henry Peard, Esq., for a robbery, they were attacked near Dixon's Glin (near Upper Glanmire), by a riotous mob, consisting of about 60 or 70 men (with an intent to rescue said Kelly), all armed with muskets, blunderbusses, and pistols, and well supplied with ammunition, who kept up a continual running fight for about three miles from the corporal's party, who expended all their ammunition except one round. The corporal and his party kept up a constant fire upon the rioters, by firing single shots, but could not do much execution as the day was very wet, and as all the rioters were inside ditches on each side the road except one of Kelly's sons, who leaped into the road from behind a ditch, and fired at the soldiers, and wounded one of them in the arm, but was shot dead on the spot. By accounts from Glanmire, we hear there are three of the rioters killed and five wounded. Too much praise cannot be given to the corporal, constables, and soldiers for their cool and spirited behaviour on this occasion, as they brought off their prisoner, and lodged him in the county goal.

CLONMEL, SEPTEMBER 24.

Committed to the county goal, the 21st inst., by Edward Collins, Esq., Michael Bourk, otherwise Prince Bourk, of Tipperary, who stands indicted in the Crown Office of the county of Tipperary, for having, with some disorderly persons, by force, violence, and menace, tendered an oath to William Ryan, of the neighbourhood of Tipperary, farmer. He is also committed, by Nicholas-Southcote Mansergh, Esq., charged by information, with assaulting Thomas Maxcy, and taking out of his breeches pocket a silk purse, and nine guineas in gold. This man, for upwards of a year, evaded a strict search made for him by the gentlemen of the neighbourhood of Tipperary, but was at length apprehended by the activity of the sub-constables of Middlethird district, resident in that town, and was conducted here by the chief and sub-constables.

(To be continued.)

RATES OF SUBSCRIPTION.

"DUBLIN PENNY JOURNAL."

Post free to any part of Ireland, Great Britain, Australia, New Zealand, Canada, United States.

Twelve months, 6s 6d; Six months, 3s 3d; Three months 1s 8d.

Printed and published for the proprietors at 90 Middle Abbey street, Dublin, by W. F. Dennehy, to whom all cheques and money orders should be made payable.

LORD PORTLESTER'S CHAPEL.

ST. AUDEON'S CHURCH, DUBLIN.
FROM A DRAWING BY PETRIE, 1832.

LORD PORTLESTER'S CHAPEL.

WITH NOTES ON THE EUSTACE FAMILY.

The following sketch of this ancient icture from the pen of Petrie accom- ies his picture of it in the old "Dublin ny Journal," 1832:—

here is, perhaps, no ancient city of ent importance in the British Islands ; has preserved so few ancient architec- l remains as our own metropolis. Of ern ruins we have, alas, but too many t of ancient ones, such as the mind d take pleasure in surveying, there is ost none: there is not even a single house remaining erected previous to the last century, and with the exception of our venerable Cathedrals, we have no one important architectural characteristic of an ancient city, and no ecclesiastical ruin of any kind, except the little chapel which is the subject of our prefixed illustration.

This ruin, which is scarcely known even to most of our fellow-citizens, constitutes a portion of the ancient church of St. Audeon's parish, which was once the most wealthy and respectable within the city. The date of the original foundation of this church is unknown—it certainly existed previous to the arrival of the English, and was appropriated to the treasurer of the Cathedral of St. Patrick by Archbishop Henry de Loundres, in 1213, and in 1467 erected into a distinct prebendary. The present church, however, has no claim to such remote antiquity, as it exhibits the architectural peculiarities of the 14th and 15th centuries. It originally consisted of a double aisle, separated by six massive octagonal columns, supporting gothic or pointed arches; but the present church only occupies a fourth of the original edifice, the remainder being, as represented in our engraving, in complete ruin.

This parish church was eminently distinguished for its ancient monumental remains, few of which, however, have survived. Amongst these, one particularly deserving of attention lies near the east end of the south aisle. It is a handsome table monument of black marble, bearing the recumbent effigies of a knight in armour, and his lady, and is still remarkably perfect.

This tomb was erected in the year 1455

by a remarkable character of his time, Sir Roland Fitz-Eustace, Baron Portlester, in the County of Kildare. He successively filled the important offices of Deputy, under the Lord Lieutenancy of Ireland of George, Duke of Clarence, the brother of Edward the Fourth—then of Lord Chancellor—and lastly High Treasurer of the Kingdom, which place he held for no less a period than 38 years. He was enobled under the title of Baron of Portlester by Edward the Fourth, in 1462; but after all his accumulation of honours, he ultimately experienced the vicissitudes of human life, having before his death been removed from the treasurership and subjected to many troubles and afflictions. He died in the year 1496, and was interred in the Franciscan Abbey Church of New Abbey, in the County of Kildare, which he had himself founded, and in which there is a similar monument to his memory, and that of his lady, the daughter of Jenico d'Artois.

The tomb in St. Audeon's Church bears on the margin the following inscription in the black letter or gothic character:—

"Orate pro anima Rolandi Fitz Eustace de Portlester, qui hunc locum sive capellumdedit, in honorem beatæ Mariæ Virginis, etiam pro anima Margaritae uroris suae, et pro animabus omnium fidelium defunctorum."

The steeple of this church was rebuilt in 1670, the former one having been blown down in 1668.

The history of the Eustace family being of considerable interest, we subjoin from Webb's "Compendium of Irish Biography" the following sketches of three remarkable bearers of the name:—

Eustace, or Fitz-Eustace, Sir Roland, Lord Portlester, was descended from a branch of the Geraldines to whom Henry II. had granted the country round Naas. In 1454 he was appointed Deputy to Richard, Duke of York; and again in 1462 he filled the same office for the Duke of Clarence. Subsequently he was tried for plotting with the Earl of Desmond, and acquitted. Created Lord Portlester, he married Margaret, daughter of Janico d'Artois, by whom he had two daughters; the elder married Gerald, 8th Earl of Kildare. He held the office of Treasurer of Ireland for many years, and was in 1474 appointed to the custody of the great seal, which six years afterwards he refused to surrender when the King granted the post to another. This was for a time a great hindrance to public business, until the King authorised the construction of a new great seal for Ireland by Thomas Archbold, Master of the King's Mint in Ireland, and that in Eustace's hands was 'damned, annulled, and suspended," while his acts as Treasurer were also repudiated. A turbulent spirit was at that time shown by many of those who should have been foremost among the King's supporters. Eustace refused to give up the seal; his son-in-law, Kildare, positively declined to admit a new Lord-Deputy, Lord Grey; James Keating, Constable of Dublin Castle, broke down the drawbridge, and defied the Deputy and his three hundred archers and men-at-arms to gain admittance; and the Mayor of Dublin proclaimed that no subsidy should be paid the Earl; while a parliament held at Naas repudiated Lord Grey's authority; and one summoned at Trim declared the proceedings of Kildare's parliament at Naas null and void. Lord Portlester died 14th December, 1496, and was buried at Cotlandstown, County of Kildare. Two monuments were erected to his memory—one in the new abbey, Kilcullen, which he had founded in 1460; the other in St. Audeon's Church, Dublin, where he had built a chapel to the Virgin.

Eustace, James, 3rd Viscount Baltinglass, a descendant of preceding, who distinguished himself in the Desmond war, was born early in the 16th century. Having with other lords of the Pale complained in 1576 to Elizabeth that their liberties and privileges had been annulled by the imposition of a cess, and that no tax ought to be levied upon them but by Act of Parliament, he was, with Lords Delvin, Howth, and Trimleston, committed prisoner to the Castle of Dublin, while their lawyers, whom they sent to represent their case to the Queen, were committed to the Tower of London. Mr. Richey says: "The opponents of the cess were the best and most loyal of the Pale—Baltinglass, Delvyn, Nugent, Howth, Plunket, Sarsfield Nenagh, and Talbot. Thus all these thoroughly English gentlemen were laid in prison in the Castle for stating that although most willing to supply the necessities of the Government, they objected to illegal exactions, forbidden by a series of Acts of Parliament, and which every Deputy had denounced as mischievous and unjust." After a year's confinement, they gave way; "but," says Mr. Froude, 'they went home in bitter humour, and the rebellion in the south was a sore temptation to them. Had they risen when Desmond rose, the resources of English power would have been severely tried. . . . [Baltinglass] was a passionate Romanist; but besides his creed he was connected in blood with the marauding tribes of the Wicklow mountains. He was the owner of Glenmalure, the scene of the murderous performance of the Naas garrison, and the victims of that remarkable atrocity were dependents of the house of Eustace. After vainly endeavouring to persuade the Earl of Kildare to rise with him, he, in the middle of July, 1580, threw off his allegiance, and sent letters to his friends asking them to join in defending their country and their religion from the assaults of the English, saying: "A woman incapable of orders could not be head of the Church—a thing which Christ did not grant to His own Mother." The Four Masters thus relate his proceedings: "James Eustace . . . broke down his castles, after having embraced the Catholic faith and renounced his sovereign; so that war and disturbance arose on the arrival of Arthur, Lord Grey, in Ireland as Lord Justice. The Kavanaghs, Kinsellaghs, Byrnes, Tooles, Gaval-Rannall, and the surviving part of the inhabitants of Offaly and Leix, flocked to the assistance of James Eustace; so that from the Slaney to the Shannon, and from the Boyne to the meeting of the Three Waters, became one scene of strife and dissension." One of Lord Grey's first acts was to collect a large force and march against him and his confederates entrenched in Glenmalure. Possibly they were put upon their guard by the Earl of Kildare, who was in Lord Grey's company. The English force of 800 men was led into an ambuscade and cut off almost to a man—Sir Peter Carey, Colonel John Moor, and Francis Cosby being amongst the slain, and the Lord-Deputy Grey escaping with difficulty. After this success, Lord Baltinglass appears to have hastened to join the Desmonds and their Spanish allies in Kerry, and to have taken an active part in the Desmond war. His fortunes, after the death of the Earl of Desmond in 1583, are thus related by Holinshed: "The Viscount of Baltinglass, being aduertised of the death of the earle of Desmond, which was no small grief vnto him, and he also verie wearie of his trotting and wandering on foot amongst bogs, woods, and desert places (being altogether distressed, and in great miserie, and now destitute of all his friends and acquaintances, and not able to hold head anie longer against her majestie's force), did embarke himself for Spaine, in hope to haue some releese and succor, and to procure some aid from the King of Spaine; and by that means to be of some abilitie to renew his force and rebellion. But he found in the end verie small comfort. And therefore of a verie melancholic greefe and sorrow of mind, as it is thought, he died, being in verie extreme pouertie and need." His death is supposed to have taken place in 1583. By an "ex post facto" law, known as the "Statue of Baltinglass," the Eustaces were deprived of their estates and titles. Sir Bernard Burke cites strong reasons in favour of the present representative of the family being legally entitled to the viscountcy.

Eustace, Sir Maurice, Lord Chancellor, descended from family of preceding, was born at his father's seat at Castlemartin, about 1590. He gained a fellowship at Trinity College, and was called to the bar, where he soon distinguished himself. He was a clear-headed man, and lost no opportunity of advancing his own interests in those disturbed times, and received grants of Harristown and other lands forfeited by Lord Baltinglass. As sergeant-at-law he attracted the notice of Lord Strafford, and in 1639 he was elected Speaker of the Irish House of Commons. His bombastic inauguration speech, given in "Flanagan's Chancellors," is singularly illustrative of the times. In the Journals of the House of Commons under 1647 is to be found his complaint concerning the stealing of his cattle from Clontarf for the use of the army. After the Restoration, in 1660, he was appointed Lord Chancellor; but as he was one of the Lords Justices, Archbishop Bramhall was appointed Speaker of the Lords. He opposed some of the most unjust results of the Acts of Settlement and Explanation. He continued Chancellor until failing health obliged him to resign the seals to Archbishop Boyle. He

elighted in rural affairs, and his demesne
; Harristown came to be regarded as the
ose beautiful seat in Ireland. The ex-
hancellor died in 1665, leaving his estates
, Kildare, Dublin, and Wicklow, besides
ie Abbey of Cong, to his nephews, Sir
ohn and Sir Maurice Eustace; also a
great house" (which probably gave its
ame to Eustace street) in Dame street,
» Trinity College for the maintenance of
Hebrew lecturer. He was interred in
t. Patrick's Cathedral.

KEEN ON MacCARTHY MORE.

BY MRS. DOWNING, 1765-1881.

Oh woe! Oh woe
That here thou'rt lying low,
hat the beatings of thy gallant heart are o'er.
That we bend above thee now,
With that death-white on thy brow;
Oh woe! Oh woe!
MacCarthy More.

Come round, come round
All you that often found
home within his ever-opened door.
Give your full hearts relief,
Raise high the wail of grief;
Let it pierce the mountain side,
Let it echo far and wide;
Oh woe! Oh woe!
MacCarthy More.

That yelping pack!
Bid the huntsman call them back;
ike the sails from the shallop on the shore.
Let the warhorse idly feed,
For of greyhound, boat, or steed
Now he'll never more have need;
Oh woe! Oh woe!
MacCarthy More.

The orphan's friend,
Who the widow dared defend,
hen, threatened and when wronged, she shrank
before
The tyrant of the plain;
But he never spoke again,
For thy bullet pierced his brain,
MacCarthy More.

Oh, bitter woe,
She, with her locks of snow,
mes to mourn for the noble one she bore.
With form so weak and frail,
With cheek so worn and pale,
Let her clasp the coffin lid,
Where her only son lies hid.
Well may she fainting fall;
Woe for her, and for us all.
Oh woe! Oh woe!
MacCarthy More.

And fair young wife,
Give up thy loving life;
t thy heart feel its anguish to the core.
Braid back thy yellow hair,
For the crape coif thou must bear.
And years of grief for him
Shall make thy bright eyes dim.
Are there any standing by
Who have greater cause to cry?
Oh woe! Oh woe!
MacCarthy More.

Fling wide the gate
Where the stricken clansmen wait;
e are coming with the master they adore,
Not to the hunting ground,
But to his burial mound,
Oh woe! Oh woe!
MacCarthy More.

Now, men of stalwart vein,
While your hot tears fall like rain,
Raise high the anguished cry,
Let it rend the rocks and sky,
Oh woe! Oh woe!
We come to lay him low,
Oh woe! Oh woe!
MacCarthy More.

AUGUSTA HOLMES.

A FRANCO-IRISH COMPOSER.

It is a sad coincidence that, just as the native music of Ireland is winning the general recognition for which it has waited so long, one of its most distinguished exponents should pass away.

Augusta Mary Anne Holmes, the daughter of Irish parents, and Irish in sympathy and temperament, was born at Paris in 1847. Her musical talent became apparent at any early age. Fearing that she might adopt the art as a profession, her parents did their utmost to discourage her purpose, in which, however, she persisted with a perseverance born of genius.

In her girlhood she became one of the most noted piano amateurs, and won spontaneous recognition wherever heard in public or private. By the time she had reached womanhood the brilliancy of her execution and a notable versatility had given her an established place as a virtuoso.

Mme. Holmes, in responding to encores, had frequently been carried by sheer force of inspiration into improvisation. Composers recognised upon these occasions an innate contrapuntal faculty demanding culture. She became a pupil of Franck and Saint-Saens, and produced a large number of works, including songs, dances, symphonic poems, and the various species of musical design which afford the contemporary composer an almost unlimited opportunity for invention and ingenuity.

Mme. Holmes was a passionate lover of the music of her race. Her symphonic suite, "Ireland," will always represent the highest achievement of her combined brain and heart. It has been frequently heard in European musical centres. Her most impressive compositions in addition to that are an opera, "Hero et Leander," the Psalm "In Exitu," performed by the Philharmonic Society in 1873, a symphony on the subject of "Orlando Furioso," of which an Adante Pastorale was performed at the concerts du Chatalet in 1877, a symphony on the subject of "Poland," universally popular in western Europe, and a symphonic ode entitled, "Ludus pro Patria," performed in 1888 at the Paris Conservatory.

Her prize competition, "Lutetia," was played for the first time in 1884. Another of her competitive compositions, entitled "The Argonauts," performed in 1881, raised her to the highest place in the estimation of orchestral writers.

Critics have agreed that the essential characteristics of Mme. Holmes' musical compositions are intense imagination, originality of design, and intrepid execution, together with, at times, an exquisite tenderness. The influence of Wagner is recognised in her ensemble effects. The spiritual melodiousness of her racial temperament is apparent in all her compositions. Probably her greatest public triumph was her wonderful symphonic poem, "Andromeda," and the triumphal ode which made a phenomenal success when first performed at the Paris International Exhibition of 1889.

Mme. Holmes felt at the start that her woman's name, if not her Irish parentage and sympathy, would be an obstacle in her career, at least as a composer. She, therefore, adopted the nom-de-plume of "Hermann Zenta" in her earlier published works. But at the Conservatory and in society she never concealed either her Irish descent or her Irish sympathy. She was also a delightful singer, having a well-developed voice of normal range, sympathetic quality, and unusual endurance, capable of conveying to an audience every phase of her own deeply Celtic emotions. She lived for a long time at Versailles, and was a familiar figure within the fane and in its environs, being also a devotee of nature, whose many lovely modes of expression abound in the vicinity of the best-known suburb of the French capital.

A Celt in every fibre, Mme. Holmes rendered arduous and unflinching devotion to the adopted country of her parents during its military vicissitudes.

Whenever Mme. Holmes' works were performed on miscellaneous programmes, the fact that their author was a woman did not occur to anyone, their constitutional strength and typical perfection commanding admiration on musical grounds alone. All critics agree that, as a composer, Mme. Holmes is not only the first of all women in music, but belongs in the highest category of the musical composers of the age. It was her own opinion, often expressed, that her Gaelic descent contained the richest portion of a natural endowment which made professional success inevitable.

Mme. Holmes was also a familiar figure in the libraries and literary circles of the French metropolis and other European capitals. Versed in the classics (which have always been cultivated to the highest excellence in higher French education), as well as in medieval and modern literature, she had no need to call upon others to write either prose or verse for her musical works, preparing her texts habitually herself. Parisian society preserves many delicious stories of the facility with which she improvised rhyme and unjingled rhythm while sitting at the piano and entertaining brilliant companies with musical extemporisations. She had also learned to play upon some of the principal orchestral instruments in order the better to qualify herself for orchestral composition. One of her most devoted advisers in the latter was Klose, the director of the band of the artillery of the Imperial Guard, and professor of the clarionet in the Paris Conservatory.

It was at her home and in her studio that Augusta Holmes was seen most characteristically. Naturally kind, her generosity to young aspirants in musical art was widely understood, and her purse was ever at the service of talent or misfortune. Her method of ascertaining merit was decisive and practical. She was indisposed to take anybody's word. As art is in its nature executive, the applicant for her assistance was promptly requested to prove title to encouragement by demonstration. If the musician that would be were an instrumentalist, a performance upon the chosen instrument was the only conclusive witness for Mme. Holmes. If a singer, she made scientific allowance for age, health, diet, previous instruction, climate, and the day's weather. Many good voices are unable to show their possibilities for weeks at a time on account of the influence of passing conditions upon the most sensitive of all musical instruments, the vocal chords. Many of the most popular singers in Europe owed to Augusta Holmes their successful start after prolonged rebuffs because she was willing to give them time and generally the necessary means requisite to a favourable examination. She was said also to possess an unerring judgment concerning fundamental ability in music which she believed to depend more largely upon temperament than on training. She was also inexorable in requiring apprentice singers to live a life of rigorous rectitude of mind and body as a pre-requisite to her co-operation in the profession. The "Latin Quarter" will talk for many months of the noble hearted

and clear-headed friend to whom so many of the poor and gifted among them are indebted for their opportunities in not only music, but also in the kindred arts.

THE HISTORY OF BREAD AND BUTTER.

"Nothing but bread and butter for breakfast," complains the school boy or girl. It was not ever so. "I know what's what; I know upon which side my bread is buttered," says Ford in his "Lady's Trial," plainly demonstrating that in the year 1639 buttered bread was considered not a necessity, but a luxury to be desired and striven for. And Lowell's immortal lines:—

The bread comes back in many days,
And buttered, too, for sartin,

are obviously an echo of this bygone state of things. Addison, again, writing early in the eighteenth century, tells a story of some young ladies who, in order to save the price of the "Spectator," proposed to their father to give up bread and butter for breakfast, much as people now might offer to give up bacon.

From such scattered hints as these we are left to construct as we can the history of bread and butter. The name and date of that inventive genius who first bethought himself to spread the one upon the other and thus combine two constituents in an organic whole is lost in the twilight of the past.

Butter is frequently mentioned in the Old Testament, but not in close connection with bread. Butter-making was not among the original arts of either Greece or Rome. The Greeks learned it finally from the Scythians, and give to the substance produced the name since adopted in all languages, Bourupoy (from Bous—cow, and rupos—cheese), a derivation which accounts for the seemingly weird forms, buttyr and butyr, not unknown among us even within the last one hundred years. The Romans, in their turn, were instructed in the mysteries of dairy work by the Germans. But in both the great nations of antiquity, though a pious opinion obtained concerning butter as a "pleasant food" and possible substitute for oil in cookery, it was practically used for medical and cosmetic purposes only.

This preference for oil has survived in Southern Europe even to our own days. In more northern regions the Teutonic tradition holding butter in high esteem probably kept its ground during the Middle Ages.

Falstaff's scornful allusion to his recruits as "toasts in butter" seems to imply that buttered toast at any rate was known in the days of Elizabeth.

ST. LOUIS EXPOSITION.

Some idea of the magnitude of the Louisiana Purchase Exposition may be gleaned from the following facts:—

The St. Louis World's Fair will be approximately twice as big as any former International Exposition.

The Centennial Exposition at Philadelphia covered 236 acres, the Paris Exposition of 1899-1900, 336 acres, the Columbian Exposition at Chicago 633 acres, the Pan-American at Buffalo, 350 acres.

The St. Louis World's Fair will cover 1,200 acres.

The construction cost of the Paris Exposition was 9,000,000 dols., that of the Columbian Exposition 48,320,000 dols., and the total cost of the Pan-American Exposition was 10,000,000 dols.

The estimated cost of the St. Louis World's Fair will be 30,000,000 dols. This will mean 40,000,000 dols. by the time the work is completed.

Before the Exposition gates are open the city of St. Louis will have expended the enormous sum of 20,000,000 dols. Of this amount 5,000,000 dols. was appropriated for the fair through the municipal assembly, her citizens raised 5,000,000 dols. additional by private subscription, and by popular vote at a special election the charter amendments were carried which will enable the city to expend 10,000,000 dols. for street paving and other improvements.

AN ARMY OF BRIDES.

M. Paul du Chaillu, the African explorer, during the course of a lecture given at St. Petersburg related that during his sojourn in West Africa he had received 22,000 offers of marriage. One black king offered him 753 brides in a single day. He had explained that if he married one the other 752 would be jealous. The king quite agreed with him, and invited him to marry all of them.

OUR WEEKLY STORY

LONGMAN'S TEST CASE.

BY CHARLES MORRIS BUTLER.

I.—THE SHERIFF'S LETTER.

Chicago's Chief Inspector of Police, John D. Shea, at 10 o'clock had finished reading his reports from the various precincts under his charge. Feeling relieved he had settled back in his seat for a quiet smoke and perusal of a newspaper, when he was handed a letter marked "private." It was as follows:—

"Bordenville, Ill., May 10.

"To Inspector Shea. Dear Sir—A series of very remarkable robberies has taken place in this (Borden) county, during the past few days.

"First, the store of Mr. W. T. Haynes, of Lewistown, was entered and robbed of all the available cash and notes usually kept in the safe for security. No violence was used in opening the safe or gaining entrance to the store. Hayes alone has knowledge of the combination of the safe, and only one other person has a key to the store.

"In Vaughanton, the general store and post-office of Miller Bros. was robbed in about the same manner as that of Hayes'. All the firm's money was taken, but not a dollar's worth of stamps or money belonging to the Government, and there was more value in these than all else stolen. Owing to this, the Government will not interest itself in the case.

"Several other places have been looted. The drug store of Janes and Co. and Dr. Wright's office in Bordenville. The police force is unable to cope with the theory, and Mr. Adolph Miller has requested me to procure a detective from your city to work up the case, guaranteeing reasonable expenses. I take the liberty of addressing you in this behalf, knowing of your interest in ferreting out crime; and trust that you will recommend to us a shrewd, secretive man for the position, one who can keep quiet, as we do not wish to alarm the neighbourhood.

"Yours truly,
"T. C. HANSCOMB,
"Sheriff of Borden County.

"P.S.—Enclosed find 50 dollars advanced fees for railroad fare, etc."

"Jackson," said the Inspector, turning to his stenographer, "answer this letter and say that I shall be pleased to detail a man upon the case at once." He then touched a button, and when a young lad opened the door entering, said:

"Alex, notify Mr. Jenks that I desire to see him."

A ministerial-looking personage entered the room almost immediately, noiselessly taking a seat near the Inspector. "Well?" he queried.

The Inspector handed him the letter. "This makes the sixth letter received from different parts this morning."

"True," curtly responded Mr. Jenks as he read the letter, "and all in the same strain, too; 'robbery; very mysterious manner; no clue; baffles the local police.' Quite an epidemic of crime."

"I want you to help me form some plan of procedure for the man I shall place upon the case. First look upon the map and see if Bordenville, Lewistown, and Vaughanton are connected by rail."

"The towns are connected," said Jenks examining the map. "Illinois Valley R. R. Bordenville, 4,500; Lewistown, 3,000; Vaughanton, 1,500 population."

"From first glance," mused the chief, "it looks very much like a common series of robberies—perhaps a gang following the wake of a circus or something like that. But I haven't had the privilege of adding a page to my 'unexplained crime scrap book' now for several months, and it is almost time to put down the outlines of another mystery not cleared up."

"For once in our lives," suggested Mr. Jenks, very affably, "suppose we simply call in the man we intend to send out and refrain from giving him any 'pointers,' but rather let him work up the case in any way he chooses—fail or succeed, just as he may."

"So be it," said the Inspector, "and what do you say to deputising Longman on the case? He made a very great success out of that Gardner-Wymer-Ravenswood affair, you know?"

"The very man! I have an idea that he will turn out to be the coming sleuth; sharp as a whip. You, yourself, Shea, were a little surprised at the development of the case." Mr. Jenks was the legal adviser of his chief, and seemed to be in very good spirits this morning.

Longman was called in from the waiting-room, while a letter of introduction was being written for his use.

"Longman," said the Inspector, "I am going to grant you a leave of absence, with privilege of working on a private case." He handed the detective Hanscomb's letter. "Do you want it?"

"Sure," spoke up the detective quickly, "of course, I want it! I am dying of inaction at present!"

"What do you think of it?"

"I haven't had time to think!" said Longman.

"Good!" exclaimed the Inspector, approvingly. "You are starting out all right. Now, Mr. Jenks wishes this to be a test of your ability, so I refrain from giving you any instructions. However, I can make you this proposition: If you succeed in clearing up this case I will see that you draw pay while away—if you fail, you get only what Hanscomb allows you. How's that?"

"I don't wish the city any bad luck," said Longman, "nor you either, Jenks, but as you consider this as a test of my ability rest assured that I shall do my best to clear up the mystery. I trust that it will be a complicated affair and that I can unravel it in a manner different from what you anticipate." The Inspector, Jenks, and Longman had been quite friendly ever since the case spoken of.

"You accept the case? You pick up the glove, as it were?" asked Jenks.

"Certainly," responded Longman.

"Then we will call the preliminaries closed," said the Inspector. "I will expect a report in writing every day. Here is your letter of introduction to the Sheriff and 50 dollars to pay your expenses. Good-bye, and don't let me see you for a week unless you clear up the case before that." And he bowed the detective to the door.

II.—EXTRACTS FROM INSPECTOR SHEA'S DIARY CONTAINING DETECTIVE LONGMAN'S REPORTS.

First Day.—Went to city office of Illinois Valley railroad for time table. Asked agent if circus company was or had been using tracks between here and Bordenville. No special cars out, but a company of theatrical people, thirty full fares and special scenery, knowing to be making one night stands along the route. Took train at 7.30 p.m. for Lewis-

Rostillian, two miles W. of Cloyne, formerly belonged to Robert Fitz-Stephen, to whom half of the kingdom of Cork was granted. But the castle, which some years ago stood here, was built by the Fitz-Geralds. It is at present the seat of the Right Hon. the Earl of Inchiquin, whose ancestor, Murrough, Lord President of Munster, took this castle, ann. 1645, which was the same year retaken by the Earl of Castlehaven. It is a noble seat, pleasantly situated on an arm of the sea at the S.E. side of the harbour of Cork, where the tide gently flows to the garden wall, and boats come up to the stairs. The present house was built on the ruins of the ancient castle. On a terrace, near the water, are some small pieces of cannon mounted, which, upon firing, render several echoes through the various hills that surround the harbour. In the house are several good family pictures; on the staircase are two large pair of those fossil horns, known by the name of moose horns. From this pleasing situation, one may see,

> ——The crouded ports,
> Where rising masts an endless prospect yield,
> With labour burn, and echo to the shouts
> Of hurry'd sailor, as he hearty waves
> His last adieu, and loosening every sheet,
> Resigns the spreading vessel to the wind.
> Thompson, p. 121.

This prospect is terminated to the W. by the islands of Spike and Hawlbowlin, and to the N. by the great island. White-well, near Rostillian, is frequented on certain days of the year by the superstitious Irish devotees; it is a fine limpid, soft water, flowing from a lime-stone rock, and not far from it is a pleasant light chalibeat spaw. Adjacent to the house is a noble park. To the S.W., near the harbour's mouth, is Cork-beg, now the seat of Robert Uniack Fitz-Gerald, Esq., built in a peninsula, to which is a narrow isthmus from the mainland; near it are the ruins of an old castle, said to have belonged to one of the Condons, for whom there is an old tomb in the decayed church of Cork-beg. Here is most excellent lime-stone, esteemed the best in the barony. On the E. side of the harbour are the remains of a large, regular fortification, with platforms below for gun-batteries, level with the water. This work was erected towards the end of queen Elizabeth's reign, but suffered to go to ruin. Near this is a lesser fortification, which, in the reign of the late King James, was made use of to annoy the landing of the Earl of Marlborough; this battery was soon taken by the seamen. The headlands, which form the entrance of this noble harbour, are little more than half an English mile asunder, so that vessels are no sooner in than they are land-locked on all sides in a large, deep, smooth, and still basin. The shore being very high on all sides, affords a noble shelter from almost every wind; but has this disadvantage, that there is scarce room to erect batteries to fortify the harbour. More to the S., on the sea-side, is Trabolgan, an old seat of the Roches, a branch of the Fermoy family.

Poor-head is the most southern cape of this barony, from whence one has a prospect of Kinsale head to the W., and a considerable tract of the sea coast to the east; this cape is bold and lofty, and well answers to Shakespeare's description, that,

> ——It is a cliff, whose high and bending head
> Looks fearfully on the confined deep.

On the western side of Cork harbour, within the mouth, is an high, round land, called Corribiny-point; on its summit is one of the ancient tumuli, raised to the memory of some Irish or Danish hero of former ages. These sepulchres were often placed on the sea-coasts; witness that of Æneas for his nurse Caieta, mentioned by the Mantuan bard.

> Tu quoque littoribus nostris, Æneia nutrix,
> Æternam moriens samam; Caieta, dedisti;
> At pius exequiis Æneas rite solutis,
> Aggere composito tumuli, postquam alta quierunt
> Æquora, tendit iter velis.
> Æneid. VII.

> And thou, O matron of immortal fame!
> Here dying, to the shore hast left thy name:
> Caieta still the place is call'd from thee,
> The nurse of great Æneas' infancy.
> Now, when the prince her fun'ral rites had paid,
> And o'er her bones a lofty mound had made,
> He plough'd the Tyrrhene seas with sails displayed
> Dryden.

And they were often, in after ages, used as land marks for mariners to steer by.

Not far from the strand of Ballycroneen, there stands on a hill a pillar stone, 8 feet high, the end of which seems to be buried deep in the earth. More to the W. is a place called Liscally, is a strong moated Danish entrenchment, with one of the highest mounds I have seen, being 12 feet high, and seems to have been less impaired by time than any other in this part of the country. Ballykendrick castle is a good, strong building, between this and Cloyne, and formerly belonged to the Fitz-Geralds.

A little to the N.E. of Middletown is a range of rocky hills, on which grow several aromatic plants; and the fields hereabouts are covered with great quantities of comfrey.

Middletown, so called from its situation, midway between Cork and Youghal, being 10 miles from each, is a borough and market town, well built and pleasantly situated, a river running at each end of it, and the tide flowing up to it, being in the N.E. angle of Cork harbour. It consists of one long street, ranging from the north to the south bridges. Here is a good market, both of flesh and fish. The Irish still call it Castre-ni-chora, i.e., the castle of the ford; and from thence an ancient abbey was called Chore abbey; in Irish, Monastre-ni-Chora, and in the records called Monasterium de Choro Sancti Benedicti Beat. Mar. Virg. It was a daughter of the abbey of Neany, or Magy, in the county of Limerick, the monks being furnished out of that house for occupying this abbey. It was founded about the year 1180, according to Ware, by the Fitz-Geralds; and, according to Jungelin, by the Barrys. Gerald Fitz-Richard, Bishop of Cloyne, appropriated the vicarages of Clonmult, Danigin, Donilbam, and Bally-spellany to this house, ann. 1476. It was granted, upon the dissolution, to Sir John Fitz-Edmond Fitz-Gerald, of Cloyne, who forfeited it in the rebellion of 1641. This town was erected into a corporation by the interest of Sir St. John Brodrick, who rebuilt the church and steeple and the greatest part of the town. It is governed by a sovereign, two bailiffs, and twelve burgesses, who return two members to Parliament. The late King James also incorporated the place; by whose charter, in 1687, Sir James Cotter, Knt., was appointed sovereign, and Philip Roche and Dominick White, merchants, bailiffs thereof; but this charter soon went into disuse. Here is a fair market-house, built with hewn stone, and adorned with a clock; and besides an English school for the education of poor children in the Protestant religion, there is a public free-school, which is an elegant building, composed of one main structure and two returns, over which was lately an handsome dome. This school was founded, ann. 1709, by the Lady Elizabeth Villiers; she was eledest daughter of Sir Edward Villiers, Father of Edward, Earl of Jersey, and maid of honour to Queen Mary when Princess of Orange; and in 1695 was married to the Lord George Hamilton, third son of William, Duke of Hamilton, afterwards created Earl of Orkney (26). She expended a considerable sum of money in building this house, and settled a good estate on this endowment, for the support of a master, two ushers assistants, a writing-master, and £50 a year for scholars entered from this school into the University of Dublin (27).

(To be Continued.)

CHRYSANTHEMUMS.

By R. Heaton.

We spring from the earth at the Winter's birth
When the ground is bare
And we reign supreme, like a passing dream
Till the world is fair.

We brave the gale, and the rain and hail,
Afraid of none!
While our petals blaze like the golden rays
Of the setting sun.

From bronze we shade, and to pink we fade
As the rosy morn;
And our lips are kissed by the dewy mist
Of the early dawn.

To mauve we turn and to crimson burn—
Then fiercer glow.
But our souls delight in our petals white
As the driven snow.

(26) Collin's Peerage of England vol. 3. p. 533.

(27) She reserved to herself a power to make rules for the governing this school. The governors first appointed by the charter were the earls of Orkney and Inchiquin, Thomas Brodrick, Alan Brodrick, and Samuel Maynard, esqrs. lieut Peter Bettesworth, and their respective heirs, together with the bishop of Cork, and the sovereign of Middletown. They nominate the master, who has £100 a year salary; an usher, who has £20 per annum and a writing-master, £20 per annum. There is £10 per annum for repairs of the house, with the sum of £50 to be distributed in exhibitions to scholars (of this house) in Dublin College, as the majority of the governors shall direct, provided no more than £15 be paid to one person. And if such scholars are not to be had, this money is to go to such charitable uses as the governors shall direct. The estate bequeathed to this school, are the lands of Ballynehortig, Ballynereguine, Ballynemeuile, Ballynodagha, 64 acres of Tullaghloane, lying in the barony of Kinalea and Kerricurihy, and all the lands leased by the late king James to sir Richard Mead, at the rent of £100 per annum. The lands of Ballysabeg and Kilgoban, in the barony of Carbery, containing 331 acres, and all other lands in the said barony, formerly set to William North, esq, by the late king James, at £100 per annum.

ANCIENT IRISH SOCIETY.

THE IRISH FIGHTING CLANS.

THE O'CARROLLS OF ELY.

By Rev. F. R. MONTGOMERY HITCHCOCK, B.D.

PART II.

We now come to an unpleasant episode in the history of the Sept, a family dispute, which did more to weaken its power than any foreign oppression could have done. To cut a long story short, when John, son of Maolroona O'Carroll, died in 1485, the chieftainship of the Sept was claimed by another O'Carroll, who was elected on account of his splendid qualities. This was the famous Maolroona O'Carroll, who, according to the Four Masters, was "the most distinguished man of his tribe for valour, prosperity, and excellence, to whom poets, travellers, ecclesiastics, and literary men were most thankful, and who gave, and entertained, and bestowed more presents than any other who lived of his lineage." But though devoted to literature, the patronage of all that was excellent, and the dispenser of princely hospitality, this, the best of the O'Carrolls, was, like the British Prince Alfred, equally proficient in the arts of war. For, while he was "the anvil of knowledge, and the golden pillar of the Elyans," he was also "the supporting mainstay of all persons, the rightful victorious rudder of his race; the powerful young warrior in the march of tribes; the active triumphant champion of Munster." This Maolroona O'Carroll was as popular among the English as he was among his own people. For he wooed and won no less a bride than the Lady Fitzgerald, daughter of the Earl of Kildare. Her sister had been previously wedded to Bryan O'Conor of Offaly. But Maolroona died, unlike most of the O'Conors, however, in his own castle on St. Matthew's Day (1532), after he had heard of the defeat of the Earl of Ormond by his sons, who took many horses, and some ordnance at a ford which was called Bel-atha-na-bh Fabcun, in memory of the achievement. His eldest son, Ferganainm, or the "man without a name," was chosen to succeed him. But the sons of John O'Carroll, the former chief, who had distressed the closing years of Maolroona by conspiring with his foes against him, at once took the field against Ferganainm, and, seizing the Castle of Birr, continued to harass the supporters of Ferganainm, who entreated the Lord Deputy, his uncle, to come to his aid. This the latter did without delay. And taking on his way the Castle of Killurin, in Geashill, the Castle of Eglish, and the Castle of Ballindoany, or Ballindown, where the sons of John had fortified themselves, he proceeded to storm the Castle of Birr. During the attempt on this fortress, which he assailed from the Monastery of Birr, the Earl was wounded in his side by a bullet, but still persisted in the attack until the place was stormed. The Earl was recalled shortly afterwards to England to give an account of his stewardship, and to answer why he, a person of English descent, had, in spite of the statute of Kilkenny, allowed his daughters to marry the Milanesian Irish, and was committed to the Tower by Henry VIII. There he died shortly afterwards (1535).

In the meantime he was succeeded by Lord Grey, whose presence was almost immediately required in the country of the O'Conors and O'Carrolls For "Silken Thomas" had commenced his absurd rebellion, and induced the only two willing clans to rally round the standard of revolt. Down to Offaly and Ely came the new Deputy, and took the castles of Eglish, Birr, Modereny, Modrymore, and Broghill, but not before much destruction had been wrought by Ferganainm. However, this proved an instance of the soft answer turning away wrath, for while O'Conor was driven from his land, and was followed by the unrelenting hatred and unremitting severity of Lord Grey, the O'Carroll succeeded in conciliating him and throwing dust in his eyes when he tendered his submission to him in Dublin Castle. It was one of the charges made against this unfortunate nobleman that he had overlooked the outrages that Ferganainm had committed. It would have been better for these Viceroys had they and their daughters seen less of the fascinating O'Carrolls.

However, the King himself in 1539 concluded a treaty with Ferganainm on the conditions that the latter was to pay tribute for Ely O'Carroll, to furnish forces to the King, and to give the Deputy passage through his dominions whenever it was necessary. Poor Ferganainm, however, did not long survive this new settlement of the question, for the unhappy man, now infirm and blind, was treacherously killed in his own castle of Clonlisk, by Seige, his kinsman, the son of Donagh and the grandson of John O'Carroll, and by one of the O'Mulloys, who seemed ever ready for such acts of inhumanity. It was a terrible scene, the assassins seemed to have got a secret entrance into the castle and attacked the blind prince unawares, but he defended himself with such vigour while some of his attendants, most of them unarmed, hurried to his assistance, and presented their defenceless bodies between the miscreants and their king, and thus obtained the glory of dying with their master.

Now ensued a decade of fighting with varying fortune, but out of which the O'Carrolls seem to have emerged the best. Trusting more to their natural wit than to the force of their arms, they secured favourable terms from their invaders, who saw that it would be wiser to treat the sept at all events with more apparent consideration than they had done. But it is questionable if there was any sincerity on either side. In 1548 it is said that Thady O'Carroll (Thady being the same as Teighe or Tadg, poet) made an arrangement with Brabazon by which he engaged himself to supply the King with forces, and that shortly afterwards he surrendered his dominion of Ely O'Carroll to King Edward VI., who restored it to him with the title of Lord Baron of Ely. But this statement is not well authenticated. It is certain, however, that this Thadeus was able to secure possession of Birr and to inflict a defeat on the English settlers. But Thadeus did not live long to reap the fruits of the victory, which were not, however, fated to be lasting. For he was slain by Cahir O'Carroll, who became Baron of Ely, and who perished as he deserved by the sword of another rival, William O'Carroll. The seed of dissension, sown by John O'Carroll and fostered by the English was indeed producing a harvest of blood in 1554.

This William wisely tendered his submission to the English, and was acknowledgde by them as the successor to the title of Lord of Ely, and having promised to fight for the King and Queen of England, and to send Queen Mary a number of horse and foot, was made Governor of Ely by Royal patent. This was all the wily William desired. The moment the Deputy's back was turned he began the old game of plundering the English settlements, in spite of the fact that the Deputy, before he had withdrawn, had taken hostages fro William and his confederates for their go behaviour, which did not last long. For find that after his return, the Earl of Ess was obliged to undertake an expedition throu Feascall to punish the O'Mulloys, and advan ing with great rapidity to Lemyvanane Castl now called Leap, he took William by surpris and the latter only escaped by the swiftness his horse. Teige O'Carroll was then put the Governorship in his place by the Englis Deputy, who saw the advantage of promotin division in the ranks of the O'Carrolls, whic was not hard to do among so quarrelsome sept. But William was not done with, for h returned in an unexpected manner to his f vourite stronghold, Caistan-an-Leine, the Cast of the Leap, and after slaying the Englis garrison, was once more master of Lemyvanan His triumph, however, was but short live for he was afterwards severely defeated by th soldiers of Essex, and had to draw in h horns and eat humble pie. It was at this tim that the districts of Leix and Offaly were mad into the shires of King's County and Queen County. Ely, which was omitted at the time being included in King's County afterward Dangen then became known as Phillipstown Maryborough being created the capital Queens County.

Under the 8th of March, 1546, we have a interesting document drawn up by "Betwyxt Sir Henry Sidney, Knight, Lord Deputy of Ire land, for and on behalf of the Queenes's Mos Excellent Majestie, of those parts, and Si William O'Kerroll, of Lemyvanan, in th countrie called Elye O'Kerroll, and now to l parcell of the King's County." This was deed of surrender, a full copy of which given in O'Donovan's translation of the Fou Masters. Its chief interest nowadays arise from the list of thirty-six landed proprietor who held the land of Ballybritt and Clonlisk under the O'Carrolls. The evident object Ely in delivering his possessions to th "Queene's most honourable Court of Chaun cerie of Ireland" was to secure them by letter patent, one of the conditions of the surrender for his illegitimate sons, of whom he ha four—John O'Kerroll, Teighe O'Kerroll, Cal loghe O'Kerroll, and Donoghoe O'Kerroll. An this he managed to do, and so excluded th legitimate heir, his own brother, Donogh Keoghe O'Kerroll, from the succession.

But the Irish septs of Ely, Leix, Offaley, an Fearcall still continued in a restless and un pacified condition. While giving fair words t the English Deputy they ceased not to pre upon each other, and to plunder the propert of the settlers, like the moss-trooping Scots o border fame. One of these expeditions agains Birr terminated fatally. For we read tha Conal Buighe, the son of Gillpatrick, the so of Pierce O'Moore, was slain at Birr in th territory of Ely, and the historian's commen is that "it was better that he was killed, fo it was to plunder the town that he had come But while the Irish wolves were quarrelling i their dens, the English bloodhounds were o their trail, tracking them to their lairs. Lor Grey, reinforced by cavalry and infantry fro England, was upon them, and "pacified" th O'Carrolls and the O'Molloys, whose chief h ordered to be executed as a seditious person On his return the Deputy released a hostage William, the son of Ferganainm, whose tragi cal death has been described. But the un fortunate man was not fated to enjoy th liberty of his native air, for as he was return ing he was attacked by some of his own clans men, who were opposed to his claims of th lordship of Offally, and who "slew him a once and left his body exposed to the claws o wolves and ravens." But the murdered man' son, John, was chosen to be the Lord of Ely He, too, did not enjoy his honours long. Fo Teighe's perfidious example was doomed to b perpetuated. John O'Carroll was stabbed th very next year, 1582, "with abominable an unprofitable treachery" by Mulroona, the so of Teige Caoch. The assassin then became victim of assassination, falling three month

afterwards by the hand of a brother of the man he murdered—Calvagh O'Carroll.

This Calvagh O'Carroll was then nominated chief of the clan, which position he managed to hold for fifteen years. He is described by the Four Masters as "a warlike, defending man, and a strong arm against his English and Irish neighbours; he was a knight by title and honour, by authority of his sovereign." In the Parliament convened by Sir John Perrott at Dublin (1585), this Calvagh O'Carroll was a distinguished figure. But there is an indelible blot of shame on his escutcheon. For it appears that Calvagh had hired some of the MacMahons from Monaghan to help him in the plundering expeditions, but when their time for payment came he had no funds to settle with them. With unspeakable truculence he conceived the idea of "removing" them. Accordingly, in his Castle of Lemyvanane, where O'Banane made his immortal leap, he made a great feast in honour of his mercenaries. But at the end of the banquet, when the revellers were overcome with the pleasures of the table, the orders were given to close the doors, and the perfidious host, violating all the traditions of hospitality, which were often of more weight in the eyes of the Celt than the laws of God, caused his armed retainers to fall upon the defenceless men who had fought his battles, and slew them to a man.

For this act of unparalleled atrocity Calvagh paid the penalty. The O'Neills from the North invaded his land, harrying and carrying all before them, and in June of the following year his life was taken "by some inferior gentlemen of the O'Carrolls and O'Meaghers." Such was the melancholy end of a great warrior, whose crimes prevent us from regarding him as a hero. When we compare the callousness and perfidy of such men—the prevalent type of the Celt at the close of the sixteenth century—with the gallantry and chivalry of their English contemporaries, of whom Sir Philip Sydney is an example, we cannot but lament the fact that his life of constant rapine and murder tended to foster all that was low and cunning, and banished all that was generous and noble from the heart of the Celtic Chief. There was nothing to encourage but much to impede the spirit of chivalry in the associations of the Irish chieftain, who knew himself to be safe in his stronghold from the representatives of the law he had so basely broken. It was well for Ireland that a new race was coming to infuse higher ideas and better customs into the wild but warm blood of the Irish clans, who when trained and disciplined have proved on many a field and in many a clime that they are inferior to no race in the game of war and the arts of peace.

In the last year of the century that had witnessed so many distressing scenes and doughty deeds we find that the O'Carrolls, who were then posing as dutiful and loyal, though, we need hardly add, little trusted servants of the Crown, were ordered to invade the O'Molloys of Fearcall, who were at this time living in the heated atmosphere of family feuds and open sedition. This order the O'Carrolls must have been only too willing to obey. Sir Charles O'Carroll appears in command of 100 men in the muster roll of the Lord Deputy Mountjoy, dated 26th March, 1600, and Captain Mulrooney O'Carroll as commanding 100 foot in O'Carroll's Country in the same and the two following years.

The seventeenth century saw many changes in this powerful sept. When the so-called "undertakere" were planted in Ely, O'Carroll, much to the disgust of the dispossessed, but much to the advantage of our poor distressful country, those of the O'Carrolls who fell in with the existing order of things fared well, while those who did not, for a time defied the English from behind their stout fortresses of Emill, Dunkerrin, or Frankfort, Lemvanane, and Clonlisk.

On an inquisition held in the year 1612 Tighe O'Carroll was found to possess some ninety acres, but Lord Thurles, on behalf of his father, the Earl of Ormond, declared that the said Teige had surrendered his claim to the Earl, and held the property as the latter's tenant. The O'Carroll afterwards disputed this statement when he found that Sir Laurence Parsons had been given possession of Birr, but after petitioning the King three times the decision was given against him. Thus endeth the connection of the O'Carrolls with their old town, which now, thanks to the genius, enterprise, and wealth of Sir Laurence and his worthy successors, was transformed from being the headquarters of a lawless predatory chieftain, and the scene of murders and rapine, into the centre of culture, civilisation, and religion—as it once was—in the midland counties of Ireland. Birr rapidly improved. Its streets were lighted, its poor were employed and protected, glass was introduced from the Bigo factory, chimneys were erected on the houses, and single women were forbidden, under pain of being exposed for three days in the stocks, to sell liquor. The "Black Castle" of Birr—a forbidding ruin that stood prominently above the river's bank, presents a significant contrast with the handsome baronial residence which has taken its place, and which has stood as many sieges and seen as much fighting under its valiant defenders—whose history in places reads like a romance—as any other castle in the land. In 1639 we read of a search made by Sir William Parsons, of Birr, and Captain William Paisley, Provost-Marshall of Munster, in the Castle of Clonles, where O'Carroll was suspected of plotting a conspiracy. The bird was flown, but the searchers found a quantity of muskets and pikes and a secret chamber, which had been used in former times for coining money. Another stronghold of the once powerful sept was Dunkerrin, the fortress of the ash tree, which afterwards passed into the hands of Thomas Francks, who obtained by grant the lands of Coologe and Castleroan; and became known as Frankfort Castle.

But the last memoirs of the O'Carrolls are associated with Emmell, a castle that had long been in their possession, and one that, like the others, except Leap Castle, which, strange to say, is now held partly in the O'Carroll name and right, was taken from them The Irish Rebellion of 1641 hastened the climax. Then the O'Carrolls, Molloys, Kennedys, and the neighbouring septs rose and burnt down the castles of the settlers, and in many cases murdered the inmates. This cruelty was not, however, universal. Many instances of gallantry and courtesy extended by the rebels to the English, notably the polite treatment which Lady Anne Parsons received from Colonel Moore, who besieged Parsonstown, relieve that story of some of its repellent and melancholy features. The tide of fortune turned, and Emmell was granted by Cromwell to Captain Rose, and its owner had to take up his abode in Cullenwaine, where he died in 1681.

He was succeeded by his son, Lord Anthony Carroll, who made a supreme but ineffectual effort to retrieve the fortunes of his ancient house. However, he was able to recover Emmell. For Captain Rose, not feeling at all safe among such determined and dangerous neighbours, who had been the loyal supporters of the House of Stuart, to which he and his late general officer, the Lord Protector, had proved traitors, was glad to dispose of it by deed of sale to Long Anthony in 1676. Anthony now became regarded as the Lord of Ely, and endeavoured, with some success, to unite the scattered fragments of his sept. However, the revolution of 1688 burst upon the land, fanning into flame the now dormant elements of party strife and hatred, and Anthony, like all the Irish chieftains, remained loyal to the King. Their loyalty cost them dear. Anthony armed his men, and took part in a great many encounters under the brilliant leadership of Sarsfield. In one of his expeditions he seized Nenagh, which was then in the hands of a party who had ever been opposed to the Stuarts. And although the castle was dismantled and its walls had not been rebuilt since Ireton demolished them in 1651, he thought of making it his headquarters for his operations in Ormond. However, he was forced to abandon it on the approach of General Leveson against him, so he evacuated the town after burning it down to prevent it being of use to the Orange party. There is no doubt that his movement was accelerated by the report that a strong body of William's men were marching against Emmell. Those men never reached their destination. The gallant Anthony was before them. And as the Dutchmen were endeavouring to pick their way through an Irish bog at Barna, the Place of the Gap, the Celts flew upon them like wolves upon their prey, and the scene of the slaughter that ensued bears the name of "the Blessed Togher" or pass through the bog.

But when King James fled, Anthony showed his wisdom by returning to his estates and submitting to the new condition of things, which he could not alter, with a good grace. Finally, the lavish hospitality of Anthony's great grandson, Richard O'Carroll, who was compelled to mortgage his castle and estates, extinguished the flickering glories of this illustrious house.

[The End.]

NOTES AND QUERIES.

RUINED CHURCHES AND SHRINES IN IRELAND.

THE ROCK OF CASHEL.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Sir—Reading the very excellent article on the Rock of Cashel, by the Rev. R. E. Fitzhenry, M. S.S., Ph., D., which appeared in the English "Catholic Fireside" some short time ago, allow me to correct through the columns of the "Dublin Penny Journal" a slight inaccuracy appearing therein. Mr. Fitzhenry states that in the tomb of the O'Kearney's is buried David O'Kearney, who was Archbishop of Cashel from 1604 to 1625. Dr. O'Kearney died on the 14th August, 1624 in the Cistercian Monastery of Carbon-blanc, near Bordeaux, and I have never heard his remains were brought for interment in our monumental tomb in the "Rock of Cashel," or our tombs outside of the rock, but always understood his remains were interred where he died. Dr. O'Kearney was for a time the sole representative of the Catholic Hierarchy in Ireland, but he, too, in the end was forced to fly. His will, executed at Carbon-blanc, bequeathed to the Jesuits a considerable sum of money, and to Paul Ragget, then superior of the aforesaid monastery, he left £100 for maintenance of the house. To the Jesuits of Cashel, his rich missals and breviaries. To his successor in the Archiepiscopal See a gold ring set in emeralds, presented to him by Pope Paul V, and to the same a pictoral cross of great price, given him by a princess of the Imperial House of Austria.

Being the last of the great and ancient family of the O'Kearney's, whose history and genealogy from the 10th century, I trust soon to add to your list of Irish County and Family Histories in the "Dublin Penny Journal," believe me, yours truly,

FRANK PATTERSON O'KEARNEY.

Salford, February 21st, 1903.

SOLUTION OF A PIANOFORTE PROBLEM.

Professor Henry T. Eddy, of the University of Minnesota, described at the Pittsburg meeting of the American Association an invention of Dr. S. A. Hageman, of interest to musicians. It is a pianoforte which renders the diatonic scale in perfectly just intonation to any desired key. It differs in outward appearance from an ordinary piano only in having, in addition to the usual pedals, a bank of a single octave, somewhat like organ pedals, which actuate a bank of sliding bars, and these in turn, move the bridges on which the strings rest, and adjust them simultaneously to any key. This Professor Eddy believes to be the first practical solution of the problem of just intonation for instruments with fixed keys.

A COUNTY CORK COMMUNIST.

Comparisons are frequently instituted between France and Ireland, but no two countries could present a greater contrast in respect to Socialism, Communism, or kindred "isms," whether in theory or practice, which find in France their centre and their life; whilst in all Ireland, and that only very lately, there is but one insignificant body, located in Dublin, which openly avows its adherence to Socialism. This contrast is all the more remarkable, seeing that Ireland is by far the poorer country, and that poverty engenders the discontent and desperation which are generally at the root of Socialism, and the still more baleful and destructive tenets of the Anarchists and the Nihilists. There are, of course, some forms of Communism or Socialism which are perfectly innocuous, such as those Communistic experiments not unfrequent in the United States of America, with one of which some of the most gifted of the American race have been connected, such as Nathaniel Hawthorne, the late Father Hecker, and other persons of education, talent, and position; but these, like similar foundations of a more radical or objectionable character, all alike end in failure. Reference will be made further on to some Communistic establishments set up in England; but nothing of the kind, we believe, has ever been attempted in Ireland, where the only prominent advocate of Communistic views was the now forgotten Corkman, William Thompson, who, curiously enough, belonged to that class which in this country is most tenacious of its rights and privileges, whether lawfully or otherwise obtained.

From a little book, long out of print, named "Sketches of Carbery," written by a Dr. Donovan, since dead, published by Gall, Dublin, in 1876—one of those much-needed local histories, of which there are unfortunately too few issued in Ireland—are derived the following particulars relative to the life and opinions of this extraordinary man—"In the neighbourhood of Lough Adereen, near Glandore, is a townland called Carhoogariff—i.e., "the Rough Quarter." This land belonged to a very remarkable and eccentric personage—a philosopher named Thompson, whose peculiar habits, strange creed, and extraordinary theories created a great sensation in Glandore and the immediate vicinity at the period alluded to. The philosopher was the son of a Cork merchant, and had spent a considerable portion of his time in France and Belgium previous to 1830, where he imbibed the revolutionary doctrines prevalent in France at that time. He was in the habit of visiting Glandore occasionally, and settled down there a short time before his death, which took place in 1832.

He soon became a local celebrity, on account of the eccentricity of his character. Thompson belonged to a Society of Communists or Socialists which made itself prominent in his time, and were known as St. Simonians in France and the United States. In Scotland and England Robert Owen, Hamilton, and Combe were the chief supporters of the system.

Thompson, being in possession of Carhoogariff, and having a considerable amount of money at his command, determined on gratifying his hobby, and carrying into practical effect his favourite idea, in the establishing of a community on the principles of mutual co-operation, united possessions, and equality of exertions and the means of enjoyment and he wrote a work indicating by its title the principles referred to.

Under the system which he wished to establish, a number of persons were to settle on a spot of ground, which was divided into equal lots of, say, one acre to each person, every individual, at the same time, bringing in a capital of from £20 to £100, as the case might be. Each person was to pursue the avocation in life which pleased him most, and for which he was best suited. He was to have an interest and share in the general prosperity of the community, whilst he contributed by his personal exertions to the welfare of all, exchanging when he wished the products of his own industry for any articles belonging to other members which he might require, and so forth.

Thompson laid the foundation of a row of buildings at Carhoogariff, where the co-operative community were to reside, and he also erected a sort of round tower or turret at Carhoogariff, which he furnished as a private residence, the ruins of which are still to be seen. He did not live long enough to carry his views into execution, as death cut him off in the midst of his speculations in 1832.

On his death all ideas of establishing the community were abandoned. He left the bulk of his property to some co-operative society to carry out the formation of a Socialistic community; but his will was upset at law, being declared invalid, as it was maintained that the property was willed for immoral purposes—one of his peculiar principles being that there should be a community of wives as well as of property.

Thompson, though a visionary and a theorist, was a man of acute intellect and considerable information. He was a strict vegetarian, and very temperate in his habits. His political opinions were those of a Red Republican, acquired in France, having adopted the revolutionary ideas prevailing there, which reached their climax in 1830.

He used to walk about Glandore carrying a tri-colour flag at the end of his walking-stick. The country people looked upon him as a sort of magician, as he was in the habit of publicly exhibiting experiments of a chemical nature, while in his own peculiar fraternity he was considered a man of ability.

One of his more practicable and reasonable speculations was the establishment of a Deep Sea Fishery Company, to superintend and develop the fisheries along the south coast, making Glandore the chief depot and centre of action, but this, like his other projects, fell to the ground.

In his will he bequeathed his body to his medical attendant, giving most minute particulars as to the preparation of his skeleton, and how the ribs were to be tipped with silver, that it might present a fashionable appearance, etc.

Monsieur Baume, a phrenologist, came across from London to claim the cranium, in order to lecture on its phrenological development. Thompson's property descended to his sister, but, being very heavily mortgaged, had to be sold in the Encumbered Estates Court. The turret he erected has tumbled down, and his co-operative buildings have been ra ed to the ground; but the eccentricities of the philosopher, his extraordinary will, and his strange career will long furnish subjects for story and gossip in and around Glandore.

The following supplementary details respecting Thompson are copied from that very entertaining volume "A Life Spent for Ireland, or The Memoirs of W. J. O'Neill Daunt" (London, Unwin, 1896). Writing under date of April 17th, 1857, Mr. Daunt says—"Rode yesterday to Skibbereen to consult Dr. Donovan (not the writer of Sketches of Carbery) about my infirm health. Discussing the best road to take home, he mentioned the little turret, for some years a noted landmark, near the base of Carrigfodha. . . . The me tion of the turret introduced the mention its founder, an eccentric man named Willia Thompson, usually called by his acquaintanc 'Philosopher Thompson.' I remember hea ing him spoken of by my father when I w a boy. The philosopher was an infidel. 'H bequeathed his body to me,' said Dr. Donova 'and with it the library, on condition of m string up his bones together "secunde artem," and sending his skeleton as a memen of love to a Socialist lady in England, a Mr Wheeler, to whom he had been attached.

"He was uncle to one of the Whites o Bantry, who expected to be his heir, and wh who insisted on having the body interred an the Anglican burial service performed over i before the will was read. The officiating par son was Jones, of Drumbeg. A poor woma became clamorous at the graveyard, insistin that no infidel should be interred among th graves of her deceased kindred. White silence her scruples with a sovereign, and she had no gone three fields away when, in crossing a ditch, she sprained her wrist, which accident she ascribed to a Divine judgment. After the funeral the will was read. The deceased had enjoined that no priest, whether Christian Mahomedan or Hindoo, should meddle with his obsequies. When Parson Jones heard this he became enraged at having read prayers over such a reprobate.

"I was anxious to obtain the library," continued the doctor, "and to entitle myself to it under the terms of the will, I exhumed the body and prepared the skeleton for Mrs. Wheeler, who sent to Ireland for it. The philosopher had bequeathed his whole estate to found a Socialist community at Cononagh, near Skibbereen, according to certain rules laid down in a work he had published. But the rules were so detestably immoral that no court of law would sanction them. The will, therefore, was pronounced to be void; and the testator's sister came into possession of the estate as next-of-kin. I never got the library, though I had earned it. . . . The philosopher had picked out a dozen or so of the most irreligious rascals he could find to act as his executors."

William Thompson was author of at least three volumes, whose titles are:—

1. Appeal of One Half of the Human Race, Women, against the Pretensions of the Other Half, Men, to Retain them in Political, and thence in Civil and Domestic Slavery (Against Mill's Article on Government). London: 1825. Prefixed to this work is a portrait of Mrs. Wheeler.

2. Labour Rewarded, the Claims of Labour and Capital Conciliated; or How to Secure to Labour the Whole Products of its Exertion. London: 1827.

3. Practical Directions for the Speedy and Economical Establishment of Communities on the Principle of Mutual Co-operation, United Possessions, and Equality of Exertions, and of the Means of Enjoyments, etc. 1830.

LECTOR.

NATIONAL AND STATE FLOWERS.

The national flower of England is the rose; Ireland, the shamrock; Scotland, the thistle; Germany, the cornflower; France (royal), the lily (imperial), the violet; Japan, chrysanthemum; Spain, the pomegranate; Greece, the violet; Prussia (as a State), the linden blossom; Saxony, the mignonette; Hanover, the red lily. Although the United States has as yet no national flower, about half the States have chosen a state flower, either by an act of legislature or the vote of the school children. Alabama chose the goldenroad; Colorado, the columbine; Delaware, the peach blossom; Idaho, the lilac; Iowa, the rose; Maine, pine cone and tassel; Minnesota, the moccasin flower; Montana, the bitter root; Nebraska, the goldenrod; New York, the rose; North Dakota, wild rose; Oklahoma, mistletoe; Oregon, goldenrod; Rhode Island, violet; Utah, sego lily; Vermont, red clover; Michigan apple blossom; California, poppy; Kansas, sunflower; Nevada, sage brush, and Washington, the rhododendrom.

LADY MORGAN.

FROM A DRAWING BY MACLISE MADE SEVENTY YEARS AGO.

LADY MORGAN.

"And dear Lady Morgan! look, look, how she comes,
With her pulses all beating for freedom like drums;
So Irish, so modish, so mixtish, so wild,
So committing herself, as she talks, like a child;
So trim, yet so easy; petite, yet big-hearted,
The truth and she, try all she can, won't be parted.

. . . . .

She'll put on your fashions, your latest new air,
And then talk so frankly, she'll make you all stare:
Mrs. Hall may say 'Oh!' and Miss Edgeworth say 'Fi!'
But my lady will know the what and the why.
Her books, a like mixture, are so very clever,
The god himself swore he could read them for ever;
Plot, character, freakishness, all are so good;
And the heroine's herself playing tricks in a hood.
So he kiss'd her, and called her, 'eternal good wench';
But asked, why the devil she spoke so much French?"

The above quotation from the author of "Ultra Lapidarius" serves well to describe Maclise's picture of Lady Morgan in Fraser's Magazine in the thirties, which shows the brilliant author of the papers on "Old Dublin," reprinted in our last two issues, sitting before a cheval glass in her baby house in London trying on the last sweet thing in the coal-scuttle bonnets then in vogue.

At her rooms in William street, London, after the death of her husband, Sir Charles Morgan, on her well-known evenings of reception, she loved to see congregated in her miniature but dainty rooms all the lions of the hour, artistic, scientific, and literary. Queen regnant of the motley crowd was the vivacious hostess, omnipresent among the heterogeneous conglomerate, with a smile for one, a tap with her memorable green fan for another, and an arch compliment for a third, blending into an harmonious whole, and reconciling with unerring tact, the most incongruous elements—Russian and Pole, Orangeman and Papist, author and critic, Royalist and rebel, Bohemian and banker, the threadbare journalist and the sprig of aristocracy—when she could catch him. Nay, it is even said that when an indignant Milesian presented himself with the expressed intention of reproaching her with her absenteeism and desertion of the "Liberator," she sent him away with the conviction that she was a femme incomprise—that her heart was in "dear old Dublin"—and that she only lived in England to benefit the Irish, and prevent them from being imposed on by the Sassenach! She was a woman who wore well, and to her was still applicable the description of one who had known her long ago at "the Castle" as "hardly more than four feet high, with a slightly curved spine, uneven shoulders and eyes, gliding about in a close-cropped wig, bound by a fillet, or solid band of gold, her face all animation, and with a witty word for everybody." Prince Puckler Muskau, who made a tour in Ireland in 1828, was struck by her as "a little, frivolous, lively woman, neither pretty nor ugly, and with really fine and expressive eyes." Another admirable pen portrait of her at a later period, in the midst of her London glories, was contributed by her friend, Mrs. S. C. Hall, to the charming memoirs of the husband of the latter, where her marvellous tact as one of the queens of society is pointed out—her brilliant talents, her expressive features, and the singularly pleasant intonations of her voice.

Of course, there are plenty of portraits of so celebrated and charming a personage. David D'Angers modelled her in France, Sir Thomas Lawrence painted her in England, and Samuel Lover in Ireland. There is a portrait in La Belle Assemblée for August, 1824, engraved by H. Meyer from a drawing by W. Behnes, which cleverly preserves her archness of expression; and we get a good profile view from the medallion by Wyon, engraved in relief by the Collas process, and published by Tilt, in the Authors of England, 1834, 4to.

EVENING.

By Rev. John Costello.

From the German of Kinkell.

The daylight wanes, the smiling vision
Of the spring bloom hath well nigh fled;
And like a dying old tradition
Fades in the west the evening—red.
The bird's head 'neath his wing is resting,
The hush of slumber is around;
The weary steed is homeward hasting,
All things their place of rest have found.

Only afar the murmuring river
Glides onward o'er the darkling wold
Its surface like a silver mirror,
Set in a frame of burnished gold;
The sails that o'er it gleam and quiver,
Kissed lightly by the evening wind,
Float to their destined haven ever,
And soon their place of rest shall find.

A sound high over earth's dominions
Of birds in rapid flight is heard,
With rustling of unnumbered pinions
The solemn evening air is stirred;
From sunny southern climes returning,
To build by northern lakes their nest,
There, all the summer months sojourning,
Shall they now find their place of rest.

And thou, my heart! the bird resemblest,
Art like the bark that onward glides,
The longings keen, with which thou tremblest,
Deep in thy inmost pulse abides.
Whether with swift, unceasing, motion
Thou like the bird dost journey on,
Or sailest like the bark life's ocean—
Thou, too, shalt rest when life is done.

Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

ENNISKILLEN, a borough and market-town, and a parish, partly in the barony of Magheraboy, but chiefly in that of Tyrkennedy, county of Fermanagh (of which it is the chief town), and province of Ulster, 21½ miles (S.E.) from Ballyshannon, and 80½ (N.N.W.) from Dublin. This place, which takes its name from the island in Lough Erne, in which it is situated, and was formerly called Inniskillen, was, previously to the time of Jas. I., merely a stronghold of Maguire, chieftain of Fermanagh, who had a castle here, which was taken by the English forces under Sir Richard Bingham, in 1594; but no sooner had that general retired, leaving in it a royal garrison, than it was besieged by the forces of O'Donnel and his confederates. A detachment sent to its assistance by the Lord Deputy was totally defeated, and the garrison, after holding out to the last extremity, being compelled to surrender, were inhumanly slaughtered by the assailants, who pleaded the like cruelty on the part of Bingham, when he took the town, as a justification of their revenge. The town, though it holds a conspicuous place in Irish history and is now the capital of the county, is of no great antiquity. The island being considered an important spot for the establishment of a military force, a royal fort was erected there about the commencement of the 17th century; and the advantage of its situation for a town induced Jas. I., in 1612, to make a grant of one-third of it to William Cole, Esq., ancestor of the Earl of Enniskillen, on condition of his building a town upon it, settling in it twenty British families to be incorporated as burgesses, some of whose descendants still hold burgage tenements; and assigning convenient places for a church and churchyard, a market-house, public school, 30 acres for a common, and a site for a prison to be built for the custody of prisoners and malefactors within the limits of the county of Fermanagh. This last condition seems to imply that it was intended to make this the assize town and capital of the county from the very date of its foundation.

On the breaking out of the war in 1641, the town was defended by its founder and governor, then Sir William Cole, who despatched the first intelligence of that event to the English Government; and so active were the inhabitants in opposing the enemy, that they not only repulsed the insurgents with great loss, but also made themselves masters of the castle of Maguire. While the Earl of Ormonde acted in concert with the royalists, this town opposed the Parliamentarian interest and firmly resisted every attack made upon it by the forces of that party; but it was finally compelled to surrender to Sir Charles Coote. During the war of the revolution, the inhabitants firmly adhered to the cause of Wm. III., whom they proclaimed king; they chose Gustavus Hamilton as their governor, and bravely defended the town, which became a refuge for the Protestants of the north-west, from all assaults of the adverse party; and from the embarrassment they caused to James's forces during the siege of Londonderry, the Protestants assembled in the town soon became celebrated as the "Enniskillen men." Lord Galmoy was sent with a detachment of James's army to reduce them, and for this purpose invested Crom castle, their frontier garrison, situated on Lough Erne; after an unsuccessful stratagem to produce intimidation, by ordering two painted tin cannons to be drawn by eight horses towards the fort, the garrison, being reinforced from Enniskillen, made a vigorous sally upon the besiegers, drove them from the trenches, and returned with triumph with considerable booty and the mock cannon which had with so much apparent difficulty been drawn up and planted against them. So successful and formidable were the frequent excursions of this band, that the ruling party in Dublin actually expected them speedily at their gates; and at length a plan was formed for attacking the town at once by three different armies. For this purpose, Macarthy, an experienced officer, who had been recently created a peer, encamped at Belturbet with 7,000 men; Sarsfield, another general equally distinguished, led an army from Connaught; while Fitz-James, Duke of Berwick, prepared to attack it from the North. The Enniskilleners, aware of the movements of the Connaught army only, marched out of the town with great rapidity, surprised the camp and routed the forces with much slaughter. On the approach of the Duke of Berwick, some companies sent from the town to seize a post which they might have defended against his numbers, ventured beyond the prescribed bounds and were cut to pieces; but on the approach of Hamilton, the governor of the town, the Duke of Berwick retired with his forces. Macarthy, at the head of an army which had already defeated Lord Inchiquin in Munster, marched towards Enniskillen and invested Crom castle; a detachment under an officer named Berry was sent to the relief of the castle, but finding it necessary to retreat before a very superior force, which had been detached by the enemy to intercept him, he was pursued, and a skirmish followed, in which the townsmen were victorious. The arrival of the main bodies respectively under the command of Macarthy and Wolsley, the latter, one of Col. Kirk's officers, brought on a general engagement near Newtown-Butler and Lisnaskea, from both which places the battle has taken its name. The inferiority of the Enniskilleners in numbers was counterbalanced by superior resolution and energy; they defeated and pursued the assailants, granting quarter to none but officers; about 2,000 were killed in the engagement, and of 500, who plunged into the lake, only one escaped drowning; about the same number of officers were taken prisoners, among whom was their general, Macarthy.

The town is situated on an island in the narrowest part of Lough Erne, or rather in a strait several miles in length, which connects the great northern and southern expanses of the lake, and in which are numerous inlets. By the charter of Jas. I., granted in 1613, the corporation consists of a provost, 14 burgesses, and all the inhabitants of the island as a commonalty. The same charter conferred upon the entire corporation the privilege of sending two members to the Irish Parliament, which they continued to do till the Union. Enniskillen was the birthplace of Lord Plunket, and gives the title of Earl and Viscount to the family of Cole, by which it was founded.

ROYAL IRISH ACADEMY.

On the 24th February, at a general meeting of the Royal Irish Academy, an interesting paper was read by Professor J. P. O'Reilly, C.E., dealing with the orientations and certain architectural details of the old churches of Dalkey Town and Dalkey Island. The chair was occupied by the President of the Academy.

In the course of his paper, the author alluded to the different mentions made of the churches in the early authors of the 18th and 19th centuries, more particularly those given in Wakeman's paper on the Dalkey Island Church, and Mr. Elrington Ball's recent work on the history of Co. Dublin. From these it could be seen that these churches were pre-Norman, and that very little was known as to the time of their construction, or as to the particular saint to whom they were dedicated. Judging from the dates of the festivals assigned to one or other of these saints, and taking into account the direction of the orientation of the old church of Dalkey, he concluded that the St. Bega, to whom the church was dedicated, was the saint venerated at Dunbar, in Scotland, and whose festival was given on the 3rd, 6th, and 7th September, according to the different authorities. The lecturer then described the old church of Dalkey Island, and submitted drawings illustrating its site and form of construction. He discussed the details of the south-east windows of Dalkey Town Church, and showed that its peculiar construction allowed the rays of light to penetrate the church so as to determine the arrival of certain festivals, and that the upper compartment of the window pointed to about the date of September 4th, a very close agreement with the dates assigned as festival days for the St. Bega, to whom the church was dedicated. He compared the window with the corresponding south-east one of Dalkey Island Church, and submitted reasons for the belief that the latter existed and was enlarged by the workmen engaged on the Martello Tower, as mentioned by Wakeman. He then considered the question of the orientation of Dalkey Island Church, and showed that it was intended to be due east and west, and that when the error was discovered, the Greek cross, mentioned as being cut on the rock in front of the church, was carved as a starting point for a true east to west line, which passed through that point and the north-west edge of the building. Referring to the unit of measure employed in the building of the church, Professor O'Reilly gave a series of measurements, from which he concluded that the unit made use of was the Castillian "Vara," or yard. A consideration of this subject raised the general question of the units of measure in use in Ireland at various times prior to the introduction of the British standard measures.

A vote of thanks having been accorded the lecturer, it was unanimously agreed to refer the paper to the Council of the Academy for publication.

Subsequently the Todd Memorial Lecture was delivered by Mr. Edward Gwynn, M.A., F.T.C.D., the subject being "The Legends of Tond Clidna and other places."

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

By CHARLES SMITH, M.D.

Æquum est enim meminisse & me, qui discerem hominem esse et vos, qui Judicetis ut si probabilia dicentur nihil ultra requiratis. Cicero Univers

In Two Volumes.

VOL. I.

The Second Edition, with Additions.

Chapter IV.—Continued.

But to return from Mount Gabriel, justly reckoned the steepest mountain of its length in Ireland, towards the coast, passing by Skull, I proceed west to Leamcon, a pretty seat of Mr. Hull, near a good harbour, between Long Island and the continent. Here are two castles of the Mahonys in ruins; the larger is called Black-castle, built on an island, to which is a very narrow passage easily defenceable; and more west is the castle of Ballydesmond, now Ballydivilin, another old seat of the Mahonys, boldly erected on a rock hanging over the ocean.

More westerly, in a peninsula, formerly called the Aldern-head, stands Crookhaven, once a place of some note, but now a small, inconsiderable fishing-town, near an excellent harbour, and one of the best outlets in Europe for vessels to sail to any place whatsoever. The lands about it are exceeding rocky and barren, a great part of which belong to the see of Cork. Near it are the ruins of an old castle, called Castle-Meghan, said to be built by Meghans, or, according to others, by the O'Heas.

The extreme point of this tract is called Ballyvogy- head, between which and the opposite cape, called Missen-head, anciently the Notium Promontorium of Ptolemy, is a great bay; and another between that and Three-castle-head, so called from three square towers built on it by the Mahonys; then comes the larger bay of Dunmanus, which has its name from Dunmanus castle, erected on the east banks thereof by that sept, and was fortified with walls and flankers. Near it is a good house of Mr. Donovan, with adjacent fish palaces; it is the estate of Sir Charles Moore, Bart. Towards the bottom of the bay is Dunbeacon, another castle of the Mahonys; it was purchased from Mr. Michael Apsley by Sir Richard Boyle, Dec. 9, 1602. Near it is a good house of Mr. Driscol; it is now the estate of Mr. Townshend. This whole peninsula, from Ballydehad village to the bay of Dunmanus is called Ivaugh, and belonged to O Mahon-fune, whose castles I have already enumerated. Crossing the bay of Dunmanus, we come to another peninsula, called Minterbarry, a most barren country, washed on the E. by Dunmanus bay, and by Bantry bay on the W. Towards the N. part the MacCartys, who were known by the name of Mucklagh, had a good seat at a place called Cool-long. All this country is mountainous, rocky, and boggy beyond description.

Here moss-green trees expand the smallest leaf,
Here half an acre's corn is half a sheaf,
Here hills, with naked heads, the tempest meet,
Rocks at their sides, and torrents at their feet,
Or lazy lakes, unconscious of a flood,
Whose dull brown naiads ever sleep in mud.
Yet here cotnent can dwell.——— Parnel.

A small river, named Four mile water, so called from its distance from Bantry, falls into the bay of Dunmanus; and near it is a good house of Mr. Blair. The N.W. part of this barony was anciently named Clancahill, and belonged to O'Donovan, as I have already mentioned. Here are few places of any note, except Barnahelly, now Tonson's-town, and Butler's-gift, two new built farm-houses with some improvements.

Dromaleague is a small, inconsiderable village; an accident happened here a few years ago, caused by lightning, which shattered a slate-house; for entering at the east it passed through the west end, and left both walls pierced through in many places, without making any considerable crack, and doing no other damage, although there were many people then in the house. Not far from this place is Castle-Donovan, seated among the mountains formerly the seat of O'Donovan. More easterly is Togher castle; it belonged to the MacCartys, of Glawnacrime, which is still a wild, desolate tract, except a little tolerable land near the castle, where the soil is brown and deep, and produces corn and fruit. To the S. runs a branch of the river Bandon, down to Dunmanway.

A stupendous chain of lofty mountains terminate this barony on the N.W., which runs through the northern parts of Bantry into Glanerought, in Kerry. The principal of these mountains in this county are those of Daunce and Shehy, either of which are little inferior to the mountain of Knockmeledown, in the county of Waterford, whose perpendicular height is 900 yards. At the foot of Shehy is a lake stored with a species of red trout, which never rise at a fly; and I have heard of the same being in the lough near Blarney castle.

Having mentioned everything remarkable in this barony, I shall proceed to describe the islands on the coast, some of which are pretty large.

The island of Cape Clear is the most southern land in Ireland; but it has been misplaced in all our maps and sea-charts. It is a parish of itself, containing 12 plowlands; in the ecclesiastical books it is called Insula Sancta Clara; and in the old Irish MSS. Inish Damhly. The north side bears potatoes, barley, and a little wheat; and the south is mostly a craggy rock. On the N.W. point stand the ruins of a castle, built on a rock in the sea, called Dunanore, i.e., the Golden-fort. There is a very narrow passage, about a yard broad and 10 yards in length, to this castle; this path is high and steep on both sides, the sea on either hands being very deep, so that few but persons well used to it will venture to walk it over; when I got up to the top of the castle, and saw the ocean roaring on all sides of the rock, I wished heartily to be again on the main land. This castle and island formerly belonged to O'Driscol, and were taken, on the 22nd of March, 1601, by Capt. Harvey, who soon after obliged Sir Fineen O'Driscol to submit to Queen Elizabeth.

In this island there are about 400 families, who have a good quantity of sheep and cows, some swine and horses, but all their cattle are very small. The island is scarce able to support its inhabitants, who are often obliged to have provisions from the shore, and in the most plentiful years they never send any to market. Towards the middle of the island is their chapel, a large building, but as destitute of any ornament as a barn. Here most of the inhabitants meet on Sundays and holy days; and near it is the priest's house, who is temporal as well as spiritual judge in his parish, and is absolute governor of the island; but, perhaps, as poor a one as any in Christendom. A little to the east of the castle is a cove, called Tra Kieran, i.e., St. Kieran's strand, on which is a pillar stone, with a cross rudely cut towards the top, that they say was the workmanship of St. Kieran (17),; and near it stand the walls of a ruined church, dedicated to the same saint. This stone they hold in great veneration, and assemble round it every 5th of March, on which day they celebrate the festival of their patron. On the S.W. side of the island is a creek, in which a large vessel may be saved upon occasion; and there is a smaller one on the north side, opposite to it, only fit for boats. Between these creeks is a narrow isthmus, about a quarter of a mile broad, with hills to the east and west, which from the sea makes the island seem to be divided. In the south cove there are from seven fathoms to 18 feet of water, where a very rich vessel, about twenty-six years ago, was saved, being in the greatest distress, having several feet of water in her hold; she came in by the light of a candle from a cabin in the island, and when day appeared the crew found themselves in a snug basin, but in what part of the world they did not know, being directly come from the West Indies.

Towards the west end of the island is a freshwater lough, abounding with a black kind of worm, about two inches long, shaped like a leech, soft, and easily break-

(17) This Saint Kieran was the first Bishop of Saiger, now a part of Ossory. Archbishop Usher says, he was born in this island. Primordium, p. 785.

ing to the touch. The water of this lake is of a most saponaceous abstersive quality; it very readily dissolves soap; and the inhabitants affirm that if a cask in which train oil had been kept was to be laid for a few days in this lough, it would be taken out sweet and clean. A quantity of this water was twice transmitted to Dublin, where it was examined by Dr. Rutty, who affirms he obtained a small quantity of natron from it, to which he imputes the above saponaceous quality. The inhabitants here are generally a very simple, honest people, thieving being a vice little known among them. If a person be found guilty of a crime, he is directly banished to the continent, which is the greatest punishment they can inflict on the criminal, who endeavours all he can to remain on the island. They have no liquor for their ordinary drink, except water or milk; yet very few houses are without a bottle of rum or brandy, which they will generously offer to a stranger. The houses are built with stone, mostly thatched with potato stalks, and these artfully kept down by nets, which cover the whole roof. These nets are made of ropes of straw, the meshes not quite a foot square; to the ends of these, stones are tied, which hanging down round the eves, form no disagreeable sight. There are several villages and hamlets upon the island.

They have 30 or 40 boats belonging to the place, with which they take considerable quantities of fish, and by this means they are enabled to pay their rent. When a bad season comes, they generally run in arrear, but they very honestly clear it off when the fish returns. The principal fish taken here are cod, hake, ling mackerel, &c.; hake is their staple fish, which they salt and dry. The Kinsale fishermen also come hither, and build huts, where they cure their fish, and for this they pay a smart rent. Most of the inhabitants are strong and healthy, and are seldom invaded with disorders, dying generally of old age, chiefly owing to their temperate living, hard labour, and clearness of the air. Brandy-drinking is their only debauch. They are kind to each other, courteous to strangers, who very rarely are seen on the island, and are excellent pilots, being all fishermen. But what is most pleasing, the linen manufacture has got some footing in this island; for I have seen tolerable crops of flax; most of the women spin, and it is said they purge and whiten their yarn to a degree of perfection by means of the soft water of the lake before mentioned.

Many of the rocks of this island are composed of an excellent white freestone, resembling Portland stone; they have also a black kind, proper for flags and hearthstones, which they carry by sea to Cork; and round the island are plenty of crabs and lobsters.

Adjoining to Cape Clear, between it and the main land, is the island of Inishircan, which I take to be Inis-kieran, or the island of St. Kieran, rather than the former. In this island stood the castle of Dunelong, over against that of Dunashad, which castles were possessed by the O'Driscols, and defended the mouth of Baltimore harbour. They were surrendered to Capt. Harvey on the 23rd of Feb., 1601-2, after the defeat of the Spaniards by O'Driscol. There was afterwards a regular fortification erected in this part of the island, which was garrisoned in Queen Anne's time, but it has been for several years dismantled. Near it are the remains of a barrack; and there are some old pieces of iron ordnance still lying among the rocks. Within the walls of the fort, Capt. Lionel Beecher has a good house. About a mile to the S. are the remains of an ancient abbey, founded anno 1460, for Franciscnas, by Florence O'Driscol, built after the model of that of Kilcrea, but this is much smaller. The steeple is a low square tower, from whence runs the nave of the church, with an arcaded wing to the south. Some parts of the building are slated, having been used for fish-houses when the pilchards frequented this coast. This island has very good land in it, and its soil is vastly preferable to that of Cape Clear.

In the bay of Baltimore are several islands, as Spanish island; also the island of Dunegal, a large, fruitful spot; and higher up is another, called Clare island. Midway N.W. between Cape Clear and the main are three islands, called the Calves; the west calf contains 44 acres. These are falsely laid down in all the sea-charts. Carty's island lies between these and the shore, and is larger than any of the Calves.

To the N.W. of Inishircan lies Hare island, a large, fruitful spot; and near it are four small islands, called the Schemes; also along the coast, in the following order, from east to west, are Horse island, containing 100 acres; Castle island, containing 119 acres; Long island, containing 316 acres; and west of all these is a small spot, called Goat island.

All these islands, together with the adjacent coast, produce large crops of fine English barley, by means of sea-sand, which is the manure mostly used.

This barony gave title of Earl to the noble family of Vaughan. John Vaughan, who was knighted for his services in this kingdom, by the Earl of Essex, in Queen Elizabeth's time, was, the 18th of James I., created Lord Vaughan, of Mullingar, and, by King Charles I., Earl of Carbery. His son Richard was created Lord Vaughan, of Emlyn, English honour, 19th of Chas. I.; these titles are now extinct. The last Earl, whose name was John, died January 16th, 1712, in the 74th year of his age. His daughter and sole heiress, the Lady Anne Vaughan, was married to his Grace the Duke of Bolton. It at present gives title of baron to the Right Hon. George Evans, whose father was created Baron of Carbery, May 9th, 1715, the first of George I.

There is a barony of Carbery in the county of Sligo, and also another in the county of Kildare; but they are small, inconsiderable tracts in respect of this barony.

(To be Continued.)

SOME DUBLIN HOLY WELLS

In the published reports of the very interesting lecture on the "Holy Wells of Ireland" delivered in the Father Mathew Hall, Church street, recently by the Rev. George O'Neill, S.J., M.A., the speaker referred to the principal holy wells scattered here and there throughout Ireland dedicated to various saints, and in particular described St. Phelan's Well at Clontarf, St. Augustine's Well at Galway, which was instrumental in effecting a marvellous cure which has been amply attested by leading citizens of Galway, and other wells dedicated to St. Augustine, St. Brigid, the Blessed Virgin, St. Columbkille, St. Patrick, St. Kieran, St. Kevin, St. Canice, St. Enda, and others. The wells in the county Dublin, about 50 in number, were specially sketched, including one close to Merrion, on the road from Donnybrook, on east side of Ailesbury road; Our Lady's Well at Mulhuddart, two at Dalkey, St. Patrick's Well at Nassau street, one in Bailey's timber yard in North Anne street, one under the present roadway in Patrick street, one on the high road from Dublin to the Scalp, beyond Stepaside, at Wellpark; one near Finglas, one at Lusk, Castleknock, Clondalkin, Hill of Lyons, Montpelier, Swords, Lucan, St. Kevin's Well at rere of the fruit shop at corner of Montague street and Camden street; one between Old Connaught and the Scalp, ont at Portrane, one close to the bridge over the Tolka at Drumcondra, one near Coolock, one at Donnybrook, at Malahide, Skerries, Templeogue, Tallaght, Bohernabreena, Glenasmole, one at foot of Kilmashogue Mountain, beyond Rathfarnham; one under the Three Rock Mountain, beneath the old Church of Kilgobbin; one at Jamestown, one at Kill-o'-the-Grange, at Blackrock. Mr. MacArthur writes:—In addition to the celebrated wells in and near Dublin above-mentioned, we have others—Lambay and Feltrim; the Finglas Well is dedicated to St. Patrick; St. Brigid's Well at Rathcoole, St. Kevin's at Ballymore, St. MacCuilin's at Grallagh, St. Morchuda's at Portrane, St. Anne's at Ballinascorney, St. Kenny's at Donabate, St. Maelruan's at Tallaght, St. Benedict's Well, Dalkey Island.

St. John's Well, Kilmainham, was at the now site of the junction of St. John's road and the South Circular road, near the Royal Hospital. Burton, the historian, of Kilmainham, described it as "the Siloam of Kilmainham once, now a neglected rill. Beside it, in the days of yore, the Asiatic templar spake of Jerusalem and laved his hands." The festival was on each 24th June. St. Tintan's Well, Howth, is on the east side of the Hill near the little ruined chantry of that name; the festival here was held each 21st October.

St. Dolough's Well had over it a Latin inscription, translated, beginning:—

> Bethsaida's sacred pool let others tell
> With healing virtues how her waters swell;
> An equal glory shall Fingallia claim,
> Nor be less grateful for her blissful stream.

We had long ago another St. Dolough's Well in the city of Dublin, near the Chapel of St. Dolough, in the lane running from Fishamble street to Wood quay. St. Dolough's Well here was the baptistry a few feet away from the Chapel, and adorned with emblematic fresco paintings. An account in 1747 says: "In Bone street, now Fishamble street, stood formerly a chapel of ease to St. John's Church, dedicated to St. Dolough, an anchorite whose feast is celebrated on the 1st of August, on which day and during its octave is visited a famous well in Fingal, between Belgriffin and Kinsealy, about five miles from Dublin, contiguous to a church sacred to the memory of this vener-

ole solitary whose life was formerly pre-rved at Malahide, but now not to be met ith."

Under the passed-away Church of St. ride's was a famous well; and city wells cluded Mary's Abbey Well, St. James' Well, ie Well in the glen near the Viceregal odge, Phœnix Park—the Fionn-uisge "or ear water" of old—to give some instances.

MUSEUM DEMONSTRATION.

On 24th February Mr. R. M. Barrington gave a monstration in the Museum, Kildare street, der the auspices of the Royal Dublin Society. ie demonstration dealt with the subject of Birds Useful to Farmers," and in the course of s remarks Mr. Barrington dealt at considerable igth with the habits of birds most commonly own to and most liked by farmers, not only Ireland, but elsewhere. A number of such ds, he said, were really not quite so bad as y were generally supposed to be, for though y did certainly manage to accomplish some mage, it was not on quite such a large scale was pretty generally supposed. Amongst m he mentioned the sparrow, which he imed was useful to farmers during practically even months out of the twelve. The thrush d blackbird he described as being invaluable as troyers of grubs, though they were injurious, smuch as they carried the seeds of the briar t hedgerows. The starling had no equal ongst the birds, from the farmer's point of w, as it did practically no mischief, except to es. The wood-pigeon did service by eating cken-weed and other noxious growths, a pro- which it continued for from ten to eleven nths of the year. More or less similar ser- s were rendered by other birds, such as the ow wagtail, bullfinch, and crow, the last- ned of which did an enormous amount of good.

MY GARDEN.

I have a little garden set
With lavender and mignonette,
And here my dial stands to mark
The dawning of each day from dark—
And here, as Beatrice imaged fair,
The strong light shining on her hair,
Closing here eyes in death's repose,
While on her hands the white dove throws
The longed for poppy flowers of sleep—
So I my trys with death would keep,
Beside my garden's dial stone
Like Dante's Beatrice—alone.

My garden of sweet dreams and fancies,
Tall lilies and my purple pansies,
My rosemary for remembering
The love of many a bygone spring;
Were it not best to pass away
In evening hour of quiet day,
Alone beside my gentle flowers,
Who comforted my lonely hours
And blessed me as such beings bless,
With their exceeding loveliness?

Alone—in one swift moment pass,
Leaving no shadow of the grass,
Where oft my earthly form hath shed
A shadow on each garden bed—
All unattended—voiceless prayer
Uttered beside me—everywhere—
Into the flowerless, strange unknown,
Alone—still in God's hands—alone.
—Arabella Romilly, in the "Rambler."

TOUGH GLASS.

C of the so-called "lost arts" appears to v been re-discovered, partially, a least, by Kauffeld, of Matthews, Indiana. It is a s of making glass of extraordinary tough- so that it will withstand rough usage and t changes of temperature without break- The composition of the new glass is the of the inventor. The product is said to te as transparent as ordinary glass, and, s, even a little clearer. Tests that prove rprising toughness of this glass are: Boil- ter in a lamp chimney made of it, and uch a chimney to drive nails. If the chim- first cooled in ice-water and then suddenly a flame it does not crack.

SOCIETY OF ANTIQUARIES.

On 24th Feb., an evening meeting of the Royal Society of Antiquaries of Ireland was held at the Society's Rooms, 6 Stephen's green. The President, Mr. John Ribton Garstin, D.L., presided, and the attendance was large

Two Papers were read, one "A List of High Sheriffs of Co. Carlow from the earliest date to the last Century," by Colonel Vigors, and "Celtic Heraldry and the Arms of the Kingdom of Ireland," by Rev. Canon Ffrench, M.R.I.A.

Colonel Vigors, in the course of his Paper, said his list went back to the 14th century, and he had brought it down to the first year of the present century. The first year of the 14th century was his starting point, although there was no doubt sheriffs were appointed a long time before that date. Sheriffs appear to have been sent to this country in the 13th century, and in 1281 there was a report from the Bishop of Waterford complaining that these gentlemen were injurious to the King and also to the people. The total number of names he had got exceeded 300, the first being in 1307, De Vale. There were many blanks in the list up to 1538, when many well-known names occurred—Fitzgerald, St. Leger, Carew, and Kavanagh. One was murdered in the year 1358, and the Abbot of Graigueananagh was fined 40s. Many of the sheriffs were appointed during pleasure and appeared to have held office for many years. It was very possible for some years sheriffs were not appointed, and the Seneschals did their work. The duties of Seneschals appeared to resemble those of the sheriffs, and they were given power to finish "rhymers, Irish harpers, idle men and women, and those who aided them, and all such idle men and women" (laughter).

On the motion of Mr. Reddington Ball, seconded by Canon Ffrench, it was resolved to refer the Paper to the Council to be published.

The President, in putting the motion, said in late years the Lieutenants of counties, who were modern officers, comparatively had rather taken the place the sheriffs previously occupied; still he had no doubt the calling together of the counties was the duty of the sheriff, and he could call on any man to help to keep the peace. It was also part of his duty to see that executions in his county were carried out. He himself had one experience of this kind, and the letter from the executioner was commendably brief. It was: "My terms is 10 guineas and I brings my own ropes" (laughter).

Rev. Canon Ffrench, in the course of his Paper on "Celtic Heraldry," said the arms or badges of which he was about to treat were Imperial bearings or allegorical designs, emblazoned on the shields and standards of the ancients. Necessity required the different nations and tribes should be some well-known sign or badge by which they could distinguish one from the other. In Egypt they found the earliest traces of the use of heraldic symbols, or badges. In Ireland banners bearing various colours seem to have been associated with the different tribes at a very early period. Favourite signs worn by the ancient Irish were a dead serpent and the rod of Moses. Badges and signs seemed to be common enough among Irish tribes, such as the Red Hand of the O'Neills. The Celtic tribes were distinguished by the particular colours worn, and they had ocular demonstration of that in the tartans of the Scotch of to-day, and in Ireland each class was known by the number of colours worn, which was specially regulated by law. The ancient Irish had a heraldry of their own, by which the various tribes were distinguished, one from another, but when they sought for any coat-of-arms of the whole land they were face to face with a difficulty. He was disposed to think the heraldic colour of Ireland for the time being was that of the tribe which supplied the country with the Ard Righ. The arms of Ireland for a great number of years after the Conquest was now borne by Munster alone, and in the time of Edward IV. a commission reported that the arms of Ireland were three crowns, and the meaning to be attached to this was a subject of great controversy. Some held it represented the Three Kingdoms, and others that it represented the Triple Crown of the Pope. How did green obtain its present position as symbolic of the Emerald Isle? One explanation was that it originated with the Ulster Irishmen, who made a blend of orange and blue and obtained green, but there was proof that emerald green was borne on an Irish standard long before their time. It would seem green began to assert itself as the National colour in the 16th century, and it succeeded in establishing itself in the 18th century. One of the probable reasons might be that the Heralds had made green the ground of the Shield of the Province of Leinster, and thus gave it great prominence

A discussion followed, and it was resolved to refer the Paper to the Council to be published.

THE EARLDOM OF DESMOND.

The following interesting note of the Earldom of Desmond appeared in "Notes and Queries," London, April 23rd, 1892, over the signature "Ave, Vale, Salve," but the present writer has some idea that it was subsequently controverted. The title is still held, we believe, by an English nobleman, Lord Denbigh; but, as in the case of Lord Clancarty, his connection with the Geraldines of Desmond is very remote, if not entierly non-existent:—"The last Geraldine Earl of Desmond died A.D. 1607, unmarried, at the age of twenty-nine, in the Tower of London, where he was brought up as a Protestant by Queen Elizabeth, who was his godmother. He is always called "The Queen's Earl" for that reason. She created him Earl of Desmond by a fresh patent dated October 1st, 1600, his father, the Earl Palatine of Desmond, having forfeited his title, having been outlawed for his rebellion, when his estates were also confiscated to the Crown, before he was murdered in 1583. Besides this only son he left several daughters, the eldest of whom, Lady Katherine Fitzgerald, was married to Daniel O'Brien, the brother of the fourth (the great) Earl of Thomond, and he was created Viscount Clare for his services to the English Crown. His grandson, the third Viscount Clare, was outlawed, and his property, about 56,931 Irish acres, was confiscated for his adherence to James II., whom he followed into France after the Battle of the Boyne. His two sons went with him into exile. The eldest died of wounds, unmarried. His brother Charles succeeded as fourth Viscount Clare, commanded the Irish Brigade, and died of wounds at the Battle of Ramillies. In Thomas Davis's ballad he is called 'the brave old lord.' His only son, the fifth Viscount, was heir at law of the eighth Earl of Thomond, his cousin, and was known in France as Count of Thomond before he was promoted to be a Field Marshal after the Battle of Fontenoy, May 12, 1745, when the English were defeated. He left two sons, one of whom died in childhood, and the other aged 19, unmarried, in 1774. The property of the title then ascended to the heir of the line, or rather to the descendants of Honora O'Brien, sister of the third (exiled) Viscount, who had married her kinsman, John Fitzgerald, thirteenth Knight of Kerry. Their son, Maurice, was fourteenth Knight of Kerry, succeeded in his turn by John Fitzgerald, fifteenth Knight of Kerry, who died in 1741, leaving an only son, Maurice, sixteenth Knight of Kerry, who died (having married Lady Ann Fitzmaurice) without offspring in 1779, leaving his estates in Kerry to his only sister, Elizabeth Fitzgerald, who was the wife of Militia Colonel Townshend, of Castletownshend, Co. Cork. They had an only son, Richard Boyle Townshend, M.P. for Dingle in the last Parliament of Ireland. He married in 1784 Henrietta, daughter of John D. Newenham, of Maryborough, Co. Cork, and left several sons, who all died unmarried except the third son, the late Rev. Maurice Fitzgerald Stephens Townshend, Vicar of Thornbury, Gloucestershire, who by his second marriage in 1864 to Jane, daughter of J. H. Hussey de Burgh, of Kilfinane Castle (Co. Cork?) left two sons, and those two sons, Maurice and Hubert, represent the Geraldine Earls of Desmond and the O'Brien Earls of Thomond in 1892."

LITERARY NOTES.

The Royal Irish Academy is the richer by the gift of rare books and manuscripts relating to Irish history made by Sir Charles Gavan Duffy before his death. Including the large collection are letters and autographs of distinguished men extending over a period of 60 years. Perhaps the most interesting item of all is the scrap-book, in which Sir Charles placed his fine collection of portraits and caricatures covering practically the whole of the nineteenth century.

✧ ✧ ✧

A Dickens Exhibition will be held at the Memorial Hall, Farringdon street, on March 25, 26, and 27, under the auspices of the Dickens Fellowship. This is the first exhibition of Dickensiana ever held in London. A large number of promises have been received of the loan of MSS. and other relics, and Mr. Matz, the hon. secretary, would be glad of further offers of exhibits, which will be adequately insured. Communications should be addressed to him at 8 Whitefriars street, London, E.C.

✧ ✧ ✧

The first thing that strikes one on glancing through the long list of authors in the "Literary Year-Book" for 1903 (George Allen) is that while an overwhelming majority of the gentlemen supply the dates of their birth with a pleasing frankness, only one lady author in twenty is willing to acknowledge how old she is. It may be that our writers of the gentle sex are generally of the opinion of their illustrious predecessor, Madame de Staël, that a "woman is the age she looks." On the other hand, there is only one lady author who "desires her address to be withheld," and, knowing how much she dislikes advertisement, we would not for worlds reveal it.

✧ ✧ ✧

On the whole, so far as British authors are concerned, the list seems very full and representative; but there might be some slight improvement in the selection of foreign writers. Among French authors, for instance, M. Abel Hermant, president of the Societe des Gens de Lettres, ought certainly to have been included, and room might well have been found for M. Yves Guyot, who deals so largely with England in his writings on political economy. At all events, both of them have more interest for English people than, for instance, Mdme. Beauregard and M. Edmond Rousse, even though the latter are French Academicians.

✧ ✧ ✧

The question of the gains of literature has again cropped up, this time in connection with Mr. Bret Harte, and "A Man of Kent" pertinently reminds an American commentator that there is no melancholy conclusion to be drawn from the fact that Bret Harte left only a few hundred pounds. "Surely the question is not what he left, but what he spent. I know on the best authority that Bret Harte received to the last the highest price for his serial stories, but he did not save; he spent his income."

✧ ✧ ✧

Mr. Arnold G. Graves's "Clytaemnestra: a Tragedy," which will be issued shortly, with a preface by R. Y. Tyrrell, Litt.D., is not a Greek play in English, but a Greek story treated from the standpoint of the modern dramatist. In selecting his theme Mr. Graves has chosen perhaps the one subject in Greek tragic literature which lends itself to such treatment—"The Orestea"—a story dealing with emotions, passions, and situations common to all time, and appealing not only to mature scholars and lovers of poetry, but to men, young and old, who are interested in dramatic literature and the analysis of human nature.

✧ ✧ ✧

We must confess (writes the "Globe") that the up-to-date treatment of Dickens reminds me rather of that principle of "linked sweetness long drawn out" which the small boy loves to apply to his butter-scotch. "It has not hitherto occurred to anybody," says a contemporary, "to gather together the various prefaces which Dickens wrote to his books." Well, we should rather think it had not Nevertheless, this curious operation is to be performed in a supplementary volume to Messrs. Chapman and Hall's new "Biographical Dickens." That edition is so excellent that we cannot but rather deprecate the Procustean method. True the volume will also contain Dickens's contributions to "Household Words" and "All the Year Round," and other writings not previously collected.

✧ ✧ ✧

There is some amusing reading here and there in the section of the "Year-Book" called "The Contributor's Guide." The editors of various periodicals plead for stories with "conventional pleasant endings." One desires "no mud or blood" to be sent him; another solicits articles on subjects treated from a "surprising" point of view; while the conductor of a commercial organ announces that "articles scolding the British manufacturers are not invited." One may add that the "Year-Book" is full of useful information on agreements, royalties, copyright at home and abroad, publications, publishers, and so forth. There is a slip on p. 21 where "Walter" ought surely to be "Douglas" Jerrold. The "Periodical Publications" section wants revision badly. It contains a number of errors.

✧ ✧ ✧

Mr. Andrew Lang, in the introduction which he contributes to the George Douglas Brown Memoir volume, just issued by Hodder and Stoughton, has a word in defence of the "Kailyard school." He says:—"That school, I venture to assert, has by dint of a clever nickname come to be unduly despised en masse by persons of culture; I mean the kind of culture that is the child, not of experience, but of casual veerings of opinion. You may call Burns and Hogg Kailyard poets. You may call Scott's best passages of rural life and character and most of Galt Kailyard. Nicknames, like blank verse, are "not argument." Many excellent, some really admirable works have been executed by Kailyarders. Not all of them "wallow naked in the pathetic" or serve up death-bed scenes." Concerning Mr. Brown's story, "The House with the Green Shutters," Mr. Lang says: "I think it is art, but freakish, and, to use a Scotch word for our national characteristic, it is 'thrawn.'"

✧ ✧ ✧

It is a wise editor who knows his own son's manuscript. The remark is suggested by an interesting revival—in the pages of the New York "Lamp" (nee the "Book-Buyer")—of the story of Macaulay's first essay. In August, 1815, Zachary Macaulay inserted in his paper, the "Christian Observer," a violent attack on "the present universal and most ruinous practice of novel-reading," written by a correspondent who signed himself "A. A." The censor was not sparing of his adjectives, and he argued that, since man's imagination is corrupt, novels, as its fruit and food, should be utterly annihilated.

✧ ✧ ✧

This article was read by young Tom Macaulay, who was then just steeped to the lips in Richardson, Maria Edgeworth, and Fielding. He accordingly wrote a spirited reply to "A. A..," signing himself "Candidus," and reviewing the subject with all the sagacity and championship of his sixteen years. He divided novels into classes, and judged them as follows:—"The bad novels, the foolish and pernicious tales which should be all thrown into the fire. . . . Secondly, the harmless and entertaining, which should be read but occasionally. . . . Such is 'Waverly'; such are 'Evelina' and 'Cecilia,' and such the productions of the immortal Le Sage. Thirdly, the novels of Fielding and Smollett. These writings constitute a peculiar species of fictitious history, and one, I am sorry to say, more obnoxious to censure than most others. At the same time, the man who rises unaffected and unimproved from the picture of the fidelity, simplicity, and virtue of Joseph Andrews and his Fanny, and the parental solicitude of Parson Adams, must possess a head and a heart of stone. Fourthly, the moral novel, which may be read with considerable benefit. . . . Such are the spirited productions of Miss Edgeworth. . . . Fifthly, religious novels, which ought to be read. . . We have not only the authority but the example of Mrs. More our our side; a name loved and venerated by all who love and venerate genius with real Christian piety."

✧ ✧ ✧

This article was inserted by Zachary Macaulay, and it produced a storm of replies. He then learned that it had been penned in his own house by his own son. The thunder soon died away in the "Christian Observer," but for years there was a difference of opinion between father and son on the propriety of novel reading, and, as Trevelyan says, the worst was to come; for on Tom's return from Cambridge, Zachary Macaulay had to endure the distinction of being "at the head of a family in which novels were more read and better remembered than in any household in the United Kingdom."

✧ ✧ ✧

According to the "American Bookman," the most popular novel in the United States for 1902 was "Mrs. Wiggs of the Cabbage Patch," a book which has also had considerable success on this side of the Atlantic. Sir Gilbert Parker's "The Right Way," "The Mississippi Bubble," and "The Virginian" come next, and we are followed by "The Crisis," "The Man from Glengarry," "The Leopard's Spots," "Lazarre," "The Cavalier," and "Sir Richard Calmady." I hear (says the "Literary Lounger" in the "Sketch") that there is a distinct slump in the sales of fiction in the United States, and that it is becomingly difficult to organise a "boom." The fact is, of course, that the reading public is learning a certain amount of discretion, and is becoming tired of having fifth-rate fiction forced upon it by gigantic and flamboyant advertisements.

✧ ✧ ✧

A clever piece of fooling (says "The Academy") reaches us from Birmingham. It is called "Everyman's Education: A Morality Play," and its authors are C. W. Mathews and W. C. Mathews. The characters are Knowledge, Various Universities, the Board of Education, and an Out-porter. Sir John Gorst represents (without permission) the Board of Education. Sir John has rather a bad time of it. When the Universities have had their say Learning speaks:—

They've gone.
Perhaps you've had enough of it, Sir John?
SIR JOHN (in despair)
I've had enough of it to turn my brain,
My head is simply splitting with the strain.
I think I'd better cut the matter short,
And go and worry out a draft report.
So while they're out of sight I'll slip away
And make my exit.
LEARNING,
Au revoir.
SIR JOHN,
Good-day.

After which the Universities returns and Learning leads them across the stage:—

They follow her, as nearly in the attitude of Mr. Byan Shaw's "Love Baubles" as the circumstances of the case, and the licenser of plays, permit. They all disappear through the door leading to Chaos—Oxford stooping to pick up a bauble on the way. The lights are low; the shrill triumphal laughter of Learning alone is now audible.

Is Birmingham, then, coming to the rescue?

SCIENTIFIC TOPICS.

San Jose, California, has just been equipped with a system of electric lighting, the current for which is carried from a point in the heart of the Sierra Nevada Mountains, 173 miles distant from San Jose.

✧ ✧ ✧

It is possible that Florida phosphate will meet a serious competitor in the recently discovered deposits on Ocean Island, northeast of the Solomon Islands, as they seem to yield a material superior in quality to the Florida phosphate.

✧ ✧ ✧

During the last few years the bow is gradually supplanting the trolley wheel in the European street railway service. The bow consists of a large metallic loop, which rests against the electric wire at right angles. The advantages of the bow are: greater contact surface, continuity of contact, no need of reversing the bow when the direction of the car is changed, or of readjusting the contact in passing curves.

✧ ✧ ✧

Franz, the German astronomer, published two years ago an exhaustive treatise on "The Mountains and Craters of the Moon." In this work the latitude and longitude of each mountain and crater were worked out, and since that time his books has been used in all the observatories of the world as the standard. Professor Pickering, of Harvard, has been at work recently on a new atlas of the moon, discovered that no accounts has been taken heretofore of the altitude of the craters. He has discovered that the latitude and longitude measurements of each are greatly affected by the height. All previous measurements used in the study of the moon by astronomers will have to be corrected by the new series of tables, upon which Professor Pickering is still at work.

✧ ✧ ✧

Ever since Professor Tyndall first discovered the movements of glaciers, attempts have been made by scientists to ascertain the exact depths of these natural phenomena by boring. Their efforts, however, have not been attended with very conspicuous success, owing to mechanical difficulties that have been encountered. But Professors Blumcke and Hess, from Barvaria, who are well known for their studies of glaciers, have succeeded in boring through the Hintereis glacier in the Otzhal Alps, and found the ice to be 153 metres deep. The machine used for boring was driven by hand, and somewhat resembled that usually employed for experimental boring in mines, but was fitted with special arrangements for washing out fragments of ice from the bore hole to prevent their freezing together again. The expenses of the investigation, which is of incalculable benefit to science, were defrayed by the German and Austrian Alpine Clubs.

✧ ✧ ✧

The annual report of Mr. F. T. Allen, U.S. Commissioner of Patents. for the calendar year ending December 31, 1902, has been forwarded to Congress. It appears that during the twelve months its statements embrace there were 48,320 applications for patents filed in the Patent Office, 1,170 applications for design patents, 151 applications for a reissue of patents, 2,602 applications for registration of trade marks, and 1,121 applications for registration of labels. Of these applications there were 27,776 patents issued, including designs; 110 patents reissued, 2,006 trade marks registered, 767 labels and 158 prints. The number of patents that expired was 23,331. The number of allowed applications awaiting the payment of the final fees was 9,284. The number that were forfeited by non-payment of fees was 4,471. The total expenditure of the office were 1.393.345.54 dollars. The excess of receipts over expenditures was 159,513,54 dollars, and the total balance to the credit of the Patent Office in the treasury of the United States was 5,488,984.61 dollars.

✧ ✧ ✧

More patents were issued to citizens of the District of Columbia in proportion to population than any other State of Territory in the United States, the ratio here being 1 to every 1,080 of the population. The Patent Office issued 27,886 patents during the year 1902, the largest annual issue in its entire history. The number of mechanical patents issued during the year 1902 is 27,136, exceeding by 1,578 the issue of such patents for the preceding year, which was then the largest number issued by this office in any year. The work of handling this business it should be noticed that the class of mechanical patents, which has increased so largely in numbers during the last year, comprises those cases which involve the largest amount of work in their consideration. The increase of work indicated by the figures given has been met in some degree by the increase in the number of examiners which was provided in the Appropriation Bill for the year 1902-'03.

✧ ✧ ✧

The work of classification of patents has progressed satisfactorily during the past year, and the results of this valuable system are now available to facilitate the examination of the question of novelty of inventions. The duties of the assignment division of this office are to record assignments of patents and inventions, and to furnish manuscript copies of records of the office when required. During the year 1902, 24,091 deeds were received for record, of which 22,833 were recorded. Copies of records were also made, which included 16,576,150 words. The number of deeds received was 1,102 in excess of the number for the preceding year, and the number of words written in furnishing copies of records was 2,056,110 more than for the preceding year. These figures serve to indicate the rapid growth of this portion of the work of this office. During the last year Section 4883 of the Revised Statutes was amended by act of Congress, approved April 11, 1902, the change making it no longer necessary that patents should be signed by the Assistant-Secretary of the Interior.

✧ ✧ ✧

The recent experiments in America and Europe with the disease germs collected on gelatine plates from the dust of the city streets, demonstrate almost to a certainty that our municipal health would be greatly improved if there were some simple method provided to keep the dust from entering our homes and lungs. The tests made with the germs thus collected indicate that people in large cities are practically living directly over a "Cave of Furies," and that all around exist the bacteria and microbes of a score or more of dangerous diseases. If this dust remained spread over the streets of the city, it would do little harm; but every wind blows it around, and every street cleaner sweeps up enough of it to destroy a whole houseful of people. There is something insidiously dangerous in the street sweeper's broom. Death actually lurks therein far more than in the filthy corners of the streets left untouched by broom or wind. Sunshine destroys more disease germs than any other agency of nature, and when the direct rays of the sun can penetrate to the heap of filth and dirt the destruction is great. The street sweeper's work of stirring up the disease germs of the avenues is consequently partly checked in its direful results by the action of the sun's rays, which have a better opportunity to reach the floating particles of dust than when they are covering the streets in thick layers. But the dust disturbed by the broom in dark streets and alleys is not thus purified.

✧ ✧ ✧

The experts appointed by the Paris Medical Society to investigate the subject of street dust in its relationship to diseases and their spread, reported recently that the only safe way to cleanse the public thoroughfares was to flush them with water. One good hydrant, with a fair pressure of water, would do more towards cleaning the streets than half a hundred sweepers. The latter would merely collect the coarse and more visible pieces of dirt and cart them away, while the fine, impalpable dust which contained the dust germs would be left floating around in the air or disturbed in our open windows. Flushing the streets with a good force of water would carry the germs away through the sewers, and in the case of consumptive germs they would be effectually prevented from rising into the upper air for the people to breathe. A pile of filth may reek with poisonous germs, and yet if kept moist the danger to those living nearby may be comparatively small. When the dry, warm weather comes, however, the germs are separated from their environments and float in the air.

✧ ✧ ✧

One of the most satisfactory solutions to the dust problem comes from Germany, where a number of chemists have been making extensive experiments with the germs collected from the dust of Berlin and Vienna. By sprinkling chemicals of a powerful nature in the streets once a week, or once every fortnight, all disease germs are destroyed. These chemical disinfectants of the streets, or as they might more properly be called, insecticides, are prepared for ordinary disease germs that are found in the dust of streets, but there are other mixtures suited to specially virulent disease germs that may occasionally find their way into particular streets or cities. In this way it is supposed that there would be little danger of the diseases spreading further by means of the dust. There is every reason to believe that in many of our disease epidemics the dust-laden wind has been an effective agent in carrying them from one street or town to another. Sometimes the clouds of dust have been blown several hundred feet away, and small particles in the upper air have floated around for days before finally dropping to the earth again. In the upper currents of air they might travel a hundred miles before descending low enough to be breathed in by people.

✧ ✧ ✧

It has been estimated by German experts, who have made more of a study of these questions than any other nationality, that tropical diseases have in this way been carried by the wind from the mainland to islands ten miles and more in distance. Heretofore it has been said that tropical diseases were more or less local, and that the germs rarely reached an altitude of a few feet. But this must be modified in the case of germs which are carried upward by means of fine dust. While not volatile enough to float to any great distance in the air, they might easily be carried up there by the wind, and then distributed around over a wide area before falling. The germs which are destroyed by the warm rays of the sun would, of course, be killed by this exposure to the direct sunlight, but many of our worst disease germs are not injured in any way by the hot sun. They could easily be carried around indefinitely. When warm, moist, and "muggy" weather comes in our cities, we speak of it as disease-breeding weather, and this probably more aptly describes the conditions than anything else. But such disease-breeding weather would have no injurious effect upon our health if the germs of disease were not already scattered around. Sometimes o few days of warm dry weather, followed by wind, will produce the right conditions to fill the air with the germs. Right after a snowstorm or heavy rain the air is clarified, and there are fewer germs breathed in that at any other time. Every one feels the tonic of such air, and enjoys the mere breathing of it.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

WATERFORD, SEPTEMBER 25.

Yesterday the New City Court-house was opened, on which occasion the Mayor, Recorder, and a number of the Corporation attended. They afterwards adjourned and dined together at the New Assembly Rooms.

DUBLIN, THURSDAY, SEPTEMBER 27.

The exportation of Irish manufactured sail-cloth to a port in the East country has been made this week from hence—a very pleasing circumstance, as the advancement of the sail-cloth manufacture has long been a desideratum with the friends of Ireland.

In consequence of the present confused state of political affairs, a special Council of all the principal Ministers of State has been summoned for Monday next, at the Council Chamber in the Castle, where his Grace the Duke of Rutland, who has been so long absent from the metropolis, is to preside.

The happy and gentle change of weather that succeeded the late stormy winds, has enabled all the vessels stranded on the North Bull to get off. The perishable parts of their cargoes have, however, received considerable damage, as well as the vessels; the Bordeaux man is come up to the quay to be decked.

The Hillsborough packet-boat which went to pieces last Thursday night on the rocks of Donaghadee, is the second instance of the shipwreck of a Government packet between this country and Great Britain since the first establishment of these vessels; and what is still more remarkable, that in neither case a single life was lost.

We hear the proposed surveys respecting the construction and improvement of the Inland Navigations pursuant to the Act of Parliament of the last Session, will be completed before the rising of the next, in order that the legislature may may determine on the most eligible plans, and vote such sums as may be necessary for encouraging their prosecution.

The Druids-Temple discovered on that part of the lands of Killiney, called Mount-Druid, is esteemed to be a much more curious and remote piece of antiquity, than even the Stone Coffins. This Temple, beyond doubt, was erected before the introduction of Christianity by St. Patrick into Ireland; and possibly may be two or three thousand years old. It is composed of a circle of great stones, and contains three altars, with a large circular figure cut in stone, and supposed to represent the Sun, which they worshipped; and a semi-circular figure, on another stone, for purposes to us unknown. The circumference of the Temple is about 135 feet. A more accurate account of these antiquities is shortly expected.

DUBLIN, FRIDAY, SEPTEMBER 28, 1787.

Amongst the circumstances that have contributed to the conjecture of hostilities speedily commencing, is the arrival of a tender in our harbour, for the reception of sailors. This is the forerunner of immediate press-warrants, and accounts for the precipitation and bustle of the mariners in endeavouring to shelter themselves in secure concealment.

By letters from the North of Ireland we learn that some deluded people in the neighbourhood of Armagh, begin to illegally to embody, under the appellation of "Break-of-day Boys."

We have the pleasure of hearing that the fishery on the North-West coast of this kingdom has begun with great success; upwards of seven hundred vessels are fully employed, from the Bay of Galway to Achill-head, a distance of one hundred and twenty miles along shore. The take is abundant, and, if barrels and salt be not wanting, twenty or thirty thousand lasts of two barrels each, may be cured, ready for home use or exportation, by the middle of November next.

Sunday evening, about half an hour before dark, a post-chaise, with a foreign gentleman and his lady, now on their travels, was stopped on Donnybrook road, not a quarter of a mile from Stephen's Green, by four fellows, who robbed them of two curious gold watches, and money to a considerable amount.

The late William Talbot, of Mount-Talbot, county Roscommon, Esq., was remarkable not only for his fine taste in horticulture and the refinements of elegant cultivation, but the more useful and laborious pursuits of reclaiming such divisions of his estates as the hand of nature left untouched and nearly inaccessible. That gentleman having vast tracts of bog, saw that it was his duty to improve every acre he possessed, and that the reclaiming those bogs would prove a considerable accession to his fortune, and no small convenience to his tenantry. To effect this important work, he began by cutting deep and wide drains, extending through the whole in several directions, which having carried off the waters into the adjoining river, Suck, he set many teams of bullocks to plough, at the same time interlaying a stratum of lime and gravel as the furrow opened; after this he parcelled out certain quantities to his tenants to be sown, at the lowest rents; and when they had, by their exertions, brought them to produce excellent crops, he farmed back, at considerable rates, such grounds as the tenantry wished so to dispose of, while those who chose to keep their respective plots were indulged, and received every encouragement to carry them to a higher degree of perfection. Thus Mr. Talbot has the satisfaction to see his estates flourishing and his tenants industrious and happy. What an example to our men of fortune.

DUBLIN, SATURDAY, SEPTEMBER 29.

The warlike preparations going forward in England have had some effect on our funds, as well as those in London; salt provisions also have felt the concussion, and the price of them is enhanced. It happens, however, at the most favourable season; for if the demand continues, the slaughtering that is just going to begin, will supply any quantity that may be wanted.

Monday night last the postboy conveying the mail from Limerick to Nenagh, was stopped near Newport, by three men, who robbed him of four shillings and tenpence halfpenny; they then swore him if he knew of any money being in the mail, and shook it, lest it might contain cash without his knowledge, after which they suffered him to proceed.

We hear that Cornelius Grogan, Esq., is shortly to be created a Peer, and that his title is to be Lord Baron Johnstown.

CORK, SEPTEMBER 27.

We are concerned to inform our readers that the Whiteboys are now become so daring in the neighbourhood of Mallow, as to keep the inhabitants thereof in perpetual dread of their nightly excursions, which, even in the face of justice, are generally attended with acts of violence and barbarity. Not long ago they forced from the peaceable inhabitants such arms as they had provided for their defence, by means of which they are become really formidable. They have used the severest cruelties to such industrious farmers as presumed to buy tithes, even at the present reduced rates, contrary to their orders; and two nights ago destroyed several parcels of hay and corn, as the occupiers of them had drawn home their harvest without leaving tithe; and last week, as the Rev. William King, Rector of the parish of Mallow, was drawing tithe from Ringrose Atkins, Esq., one of his Majesty's Justices of the Peace for this county, his men and horses were violently assaulted from behind the out-offices of said Justice, by a shower of stones, in order to intimidate them from drawing said tithes, which they however persisted in doing, and did draw away, and of which attack proper informations are given.

Last Tuesday night a number of them, mounted and armed, went to the house of Denis Currane, of Glasheen, in the South liberties, farmer, which they forced open, and after giving him a desperate blow of a gun on the head, forced him, almost naked, on a bare-backed horse, for having taken his tithe. They also went to the house of Thomas Buckley, of Carrigohane, farmer, whom they treated in like manner, and carried the two to Carrigohane pound, tied them to the gate, and left John Horogan, the pound-keeper, and Denis Haly (whom they swore not to let them be released until ten o'clock the next day), to watch them.

Mr. Ross, our County Ranger, having received information thereof, immediately set off to the place, with a party of the cavalry, and found they were humanely liberated by Nicholas Dunscombe, Esq.; but having found the men, he brought them to town to undergo an examination, and apprehended Horogan and Haly, who were sworn to, and committed by the Mayor to take their trials at the ensuing assizes; and we doubt not these deluded wretches will be convinced the laws of the country must be obeyed, in preference to Captain Right's. Many of the horses rode on that expedition were the property of different people, and some of them so abused, as to be rendered useless to the owners.

From their frequent nightly depredations, we should be led to imagine, their conduct proceeds from a wish they have for the execution of the unfortunate wretch, one of their party, who received sentence of death last assizes, whose fate we have reason to believe, will depend on their peaceful demeanour. The long day he got after condemnation, shows the lenity so conspicuous in the noble Lord who presided as Judge, and nothing can now contribute so much to save his life, as their becoming amenable to the laws.

DRUIDICAL ANTIQUITIES.

The discovery of the ancient graves at Killeny, in the county of Dublin, which in the opinion of many were only a Danish burial place) has, however, excited the curiosity of all lovers of antiquity. The county of Wicklow appears from numerous remains to have been much more peculiarly the favourite abode of the Irish Druids; every day brings to light some monument of their residence there; within this last month several graves have been found on the estate of Mr. Saunder's, of Saunder's-grove, which appear to be of a much earlier date than those discovered at Killeny, as they contain nothing but urns with ashes and burned bones. Two of those urns are in that gentleman's possession, and are of a pale baked earth, with rude attempts at ornament. The graves are about three feet long, and eighteen inches broad, composed of four flag stones set edgeways without a bottom flag, and covered with a large shapeless stone. Many of these stones appear above ground, and seem to indicate more of those graves yet unopened. What strongly countenances the opinion of these being really Druidical, is that several of the neighbouring towns at this day bear the name of the Gods of the Druids, as Baaltinglass, Wodenbooly, etc., etc.

(To be continued.)

RATES OF SUBSCRIPTION.

"DUBLIN PENNY JOURNAL."

Post free to any part of Ireland, Great Britain, Australia, New Zealand, Canada, United States.

Twelve months, 6s 6d; Six months, 3s 3d; Three months 1s 8d.

TRISTERNAGH ABBEY, Co. WESTMEATH.

A VENERABLE RUIN NOW DEMOLISHED.

From a drawing by Bigari in the collection of the Right Hon. William Conyngham, reproduced in Grose's "Antiquities of Ireland," 1791.

TRISTERNAGH ABBEY,
CO. WESTMEATH.

The following description of the now anished ruin above depicted, its history nd that of the English family into whose ossession it came is given in the "Parlia- ientary Gazetteer of Ireland," 1844:—

TRISTERNAGH, a townland in the arish of Kilbixy, a barony of Moygoish, o. Westmeath, Leinster. It is situated on the south-west bank of Lough Iron, 2½ miles east-north-east of Ballinacarrigy. Within this townland and on the banks of the lake formerly stood the abbey of Tristernagh, founded either in the reign of Henry II. or almost immediately afterwards, by Geoffrey de Constance or Constantia. The church was a beautiful and magnificent edifice, in the form of a cross, considerable in extent, and built of a blackish coloured stone; and its steeple consisted of a square tower, surmounted by an octagon, and, in 1780, after having suffered much dilapidation, continued to be 74 feet in height. In 1783, this interesting pile was utterly demolished by its present proprietor, Sir Pigot William Piers; and its site was afterwards occupied by a cow-house and a stable. The "tasteless and unfeeling demolisher of the edifice," says Mr. Brewer, "was earnestly solicited by his neighbours to abstain from so wanton an outrage. We are assured that Lord Sunderlin offered to purchase the ruins at a high price, solely with a view to their preservation. The name of

Tristernagh should never be mentioned without an expression of contempt (as regards this transaction) towards that of Sir Pigott William Piers."

Adjacent to the site of the extinct abbey is the neglected and now dilapidated mansion of Tristernagh-house, the residence for several ages of the baronet family of Piers. "This family"—we again quote from Brewer—"entered Ireland in the person of Captain William Piers, an officer in Queen Elizabeth's army, who is noted in history as the officer to whom the famous Shane O'Neil was betrayed, and delivered up, by his Scotch auxiliary forces. It will be recollected that O'Neil was decapitated; and Piers sent the head of the chieftain to London, for which ungracious, but important, service, he was rewarded by Elizabeth with large grants of land, including the estate of Tristernagh, which still remain the property of his descendants. Sir Henry Piers, son of Captain William Piers, and granfather of the historian of Westmeath, was a man of letters, and author of a book of travels. James, son of Sir Henry, embraced the Roman Catholic religion, and became D.D. in that Church. He was royal professor of the Auquitanic College at Bordeaux, and published several literary works. Sir Henry Piers, Bart., the member of this family in which the topographer is most interested, wrote, in 1682-83, a 'Chorographical Description of the County of Westmeath,' which is printed in the first volume of the Collectanea de Rebus Hibernicis." Near the entrance to the demesne of Tristernagh stands the ruin of the chapel of Templecross, used as the cemetery of the Piers family, and containing an altar monument to the memory of the first Sir Henry Piers, the author of the book of travels. This chapel is "memorable as the place where the corp-naomh or 'blessed body,' a relic of extraordinary sanctity, was found. The relic consists of a small wooden box, about the size of a pocket Bible, having brass clasps, studded with valuable stones, and marked with a crucifix. Its contents, if any, are unknown; and no hand has been found of nerve sufficient to force it open. It is used as a test of evidence; and an oath on the corp-naomh is considered of peculiar solemnity, which, if given in support of falsehood, is sure to be visited in some dreadful manner on the guilty person. When anyone wishes his statements to be received with implicit confidence, he averts its truth by the corp-naomh that 'arose' at the Templecross."

The following are the annals of the Abbey as given in Walsh's "Ecclesiastical History of Ireland":—

Tristernagh, in the barony of Moygoish, and on the banks of Lough Iron. This priory of canons regular was dedicated to the Virgin Mary (sometimes called the priory of Killbixy), and was indebted for its foundation to Geoffrey de Constantine, in or soon after the days of Henry II. Henry was the first prior, and about the year 1200 the founder granted to the Canons divers liberties and privileges, together with four carucates of land adjoining; the islands in the Lough, and sundry other lads, with a water-mill, in Killbixy; two carucates in Cunemucks, with a mill and two fisheries, &c. Witness whereof, Simon, Bishop of Meath.

The bishops of Ardagh were great benefactors to this priory.

A.D. 1280, Adam was prior.

A.D. 1364, Richard was prior.

A.D. 1412, William was prior.

A.D. 1468, Geoffrey Delamar was prior. Geoffrey was attainted by Parliament of treason for being accompanied with Irish enemies and English rebels, who traitorously robbed, spoiled, and burned Taghmon, in the barony of Delvin, and destroyed many of the King's loyal subjects.

A.D. 1485, Richard Tute was prior.

A.D. 1530, Edmund Nugent, the prior, was made Bishop of Kilmore. Having held the priory until the suppression, he was granted a pension of £26 13s. 4d. during life, from the revenues of his priory, then dissolved.

The priory of Tristernagh paid four marcs annually to the Bishop of Meath.

In 1590, a lease of this priory was made to Captain William Piers; while seven hundred acres of arable, moor, and pasture, with forty messengers, were granted to Robert Harrison.

This magnificent and beautiful edifice, in the form of a cross, and of considerable extent, was built of a blackish stone, the steeple of which was remarkable, being an octagon on the top of a square tower, which, in 1780, though mutilated, was seventy-four feet high. The columns were also octagons, with plain capitals.

This abbey was totally destroyed in 1783.

ANECDOTE.

When Primate Boulter had succeeded in the business of reducing the Gold Coin, Dr. Swift is said to have caused a black flag to be hung out on the top of his Church of St. Patrick, and caused a dumb peal to be rung, with the clappers of the bells muffled. On this occasion of contest the following lines were written by a friend of the Dean:—

At Dublin's high feast sat Primate and Dean,
Both dres'd like Divines, with band and face clean—
Quoth Hugh of Armagh, "The mob is grown bold":
"Ay, ay," quoth the Dean, "the cause is old gold."
"No, no," quoth the Primate, if causes we sift,
This mischief arises from witty Dean Swift."
The smart one replied, "There's no wit in the case,
And nothing of that ever troubled your Grace.
Though with your State-sieve your own notions you split,
A Boulter by name is no Bolter of wit.
It is a matter of weight, and a mere money-job;
But the lower the coin, the lower the mob.
Go tell your friend Bob, and the other great folk,
That sinking the coin is a dangerous joke—
The Irish dear joys have enough common sense
To treat gold reduced like Wood's copper pence.
It is pity a Prelate should die without law;
But if I say the word—take care of Armagh."

TAXES IN FRANCE.

A Frenchman having an income of 4,000 dols. a year pays 1,000 dols. of it in direct and indirect taxes to the Government, according to a very careful investigation of M. Beaurin-Gressier, made for the Societe de Statisque. In other words, the French taxpayer must work 86 days in the year solely to earn what is due to the Treasury.

IRISH BARDS AND IRISH MUSIC.

By REV. CANON FRENCH.

Many who love Ireland with a deep and intense love like to hear stories of her bards and their songs of war and the chase, by flood and field and forest. The bards were a body of privileged men, inferior in rank only to the chief or high lord of the clan, who, in their rainbow robes, followed the King to battle. They were the war correspondents in the brave days of old, who inspired with valour the heroes who lived in high-roofed dwellings of twisted osiers, or dark bog-oak, by mountain, stream, and sea. The power and effect of their bardic music, soft, sweet, and low, sad and spirit stirring, wild and weird, like the wail of the wind-swept harp, was wonderful in effect upon the Gael and gallowglass, in peace or war. Those venerable bards imparted fortitude and fierce passion into the glowing furnace of the fighting warriors of old to do daring deeds, and to win decisive battles under the stern and grand old mountains, upon the moors and moss of ancient Inisfail. At home, where the chieftains sat within their wattled houses, and their kernes reclined on the rushes around the brazier of the burning coals, the pine torch blazing in the bronze link on the oak beam beside the seat of the veteran bard, the tones of the harp appeased an outburst of frenzy on the part of the barbaric master and wild men within the old hall in the days when might was right.

WHEN "THE COULIN" WAS PLAYED WITH CHARMING EFFECT.

The old harps of Erin were somewhat similar to the ancient harps of Egypt and Assyria. They were small in size, and made from the yew tree, wonderfully carved, with large crystals set in many of them. They had no front pillar, and but seven strings in the more primitive instruments. A monument in Kilkenny (circa 800 A.D.) shows a harp such as I have described above. Bronze trumpets, both straight and curved, were used by the bards in marching with the rude gallowglasses to the field of battle, and many of them were believed to possess most astonishing and supernatural power. Horns, hammered bells, harps, bagpipes, and lyres were used in forest and field, in rath, and rude stone tower, and moated temple. Music came as an inspiration, and song likewise, to the bards of early Britain and the Emerald Isle; "o'er moor and fen, o'er crag and torrent," the melting notes of their melodious harps were not believed to be the invention of the bard but the gift of gods. Westward the course of the old eastern musicians took its way to the sacred isles where the sun sank to repose and set in splendour. The great luminary was worshipped in the most distant western isles at a very early period of the world's history.

SOME IRISH SONGS HAVE A RARE BEAUTY.

Music still follows the course of the sun—there is ever a song somewhere. "Music is the voice of God, and therefore divine." The harp, which was confined to the chieftains and upper classes, was in use in Ireland from a remote period. She is the only country that has a musical instrument on her flag. Diodorus Siculus, an ancient bardic historian, quotes from Hecatæus, an earlier writer than he, who describes the music of the harp in the ancient Celtic sun worship. the old style Irish harp was about four feet high, had no pedals, and was strung to the back with straps. The one belonging to King Brian Boru, who was killed at the Battle of Clontarf in 1014, is still preserved in the Library of Trinity College, Dublin. It is

ack with age, and polished, but worm-eaten he old relic is adorned with silver orna-ents. The King's son, Teague, took the harp Rome after the battle, and presented it the Pope, together with the crown and galia that had been worn by his father. A ceeding Pope gave it to Henry VIII., to-ther with the title of "Defender of the ith," and Henry gave it to the Earl of anricarde, in whose family it was held until e beginning of the eighteenth century. It en passed through several hands until 1786. nen the College became its owner. In old Irish poem a bard is represented as ad-essing a fairy by way of inquiry as to its rmer splendour. The musical instrument is ade to reply that a King of Ireland owned in Pagan times, then a priest of Baal, and tly a Christian, who, like David, played on its strings songs of victory to the great essiah.

The late Sir Samuel Ferguson wrote a long dis-tation on a work by Mr. Bunting, in which traced the origin of the Irish harp to gypt. Mr. Ledwich supposes it to be de-ed from the Saxons. The ancient Irish pear to have had two kinds of harps, the uit and the Cachneird-Cruit. The first, a all harp with single cords, used probably in igious rites by both Pagan and Christian. e second, a large instrument with double ing, which was used in war and wassail. rgus, the Fenian bard, used it as an accom-iment to his splendid voice in singing his ebrated odes to Gaul and Oscar. There is allusion to the harp in a very old MS., "Book of Leccan," in an account of the atha d'Daanans, where it is said that usic, melody, and the harmony of strings re their three harpers." In an old number the "Dublin Penny Journal" there is a y interesting description of ancient Irish ps, which is thought to have been written Chevalier O'Gorman, an authority upon h pedigrees. Mr. Bunting makes out that re were no less than five different kinds of ps among the ancient Irish:—

. The Cruit, or high-headed harp.
. The Crom Cruit, or bending harp.
. Clairseach, or common harp.
. The ceirin, or portable harp.
. Craiftin Cruit Craiftin's harp.

consensus of opinion is, however, in favour wo-stringed instruments mentioned already. do's invention of musical notation, gave itional strings to the harps of Ireland. As other musical instruments hold a very ordinate place in Irish history, a brief ce of them will suffice. The bagpipes, ited at first by the mouth, were used by peasantry, and are said to have been in-uced into Ireland from Caledonia. The ple of the woods used vocal melody and d instruments from the days of Tubal n. The wild tribes marched to its (the pipe's music o'er moor and mountain. By waters of lough and glen the scream of pipes were heard centuries ago, as the ist hears it now in the Highlands of Scot-d. Improvements were made in the course ime, first the chanter, instead of the th; second, the union pipes, with the s and keys. In the long ago the Irish r stood out prominently in every picture oor Pat and his cabin. The race of pipers gradually departing, like the booming rn. In the National Museum and the al Irish Academy our readers can see y quaint bronze musical bells. Some are l-made and were hand-struck, othere were and rivetted together. Suspended from r of wood in the old Round Tower the was struck with a wooden hammer. It used to accompany the harp occasionally. ie ancient Irish have various kinds of rpets, such as the Stuic, the Adhare, and Beann Buathall. Numbers of these have found in bogs and railway cuttings all the island. They were made of horn, ze, and brass, and very long. They were blown in battle and the chase. Diarmid blew one on Ben Bulbin when in pursuit of the wild boar through the Sligo mountains. The horn of Fin MacCool could, in an instant, throw all his warriors into a deep slumber! When he blew again a loud and terrible blast, they awoke to follow their leader! In Spenser's "Faerie Queene," Book I., chap. 8, there is an account of such horns and their wondrous effects.

The violin, commonly called the fiddle, and the flute, are so well known that we need only mention them in passing.

"MAN'S MORTALITY."

"The Death of Oscar," and the "Song of the Banshee," are the most ancient airs now existing in Erin.

SONG OF THE BANSHEE.

I.

Oh, ye dead! oh, ye dead! whom we know by the light you give,
From the cold gleaming eyes though you move like men who live,
Why leave you thus your graves,
In far-off fields and groves,
Where the worm and the sea-bird only know your bed,
To haunt this spot where all
Those eyes that wept your fall
And the hearts that bewailed you like your own lie dead.

II.

The Banshee mournful wails
In the midst of the silent, lonely night.

III.

How oft has the Banshee cried,
How of has death untied
Bright links that glory wove,
Sweet bonds entwined by love.

The knowledge of music is supremely valuable, because it enables us to help our brother on life's rough road, and to give to worn and weary workers a little of that brightness and joyousness of song which in many of our homes is an everyday pleasure, but to the third toilers of the slums come like an oasis in the desert. To them life is too often a humdrum affair. They are content to exist,—merely working, eating, and sleeping. Consequently an evening of good music is an indescribable boon, reviving their best feelings, and bringing into play their noblest emotions. What a mighty power is wielded by music! At one time by thunder tones rousing us to enthusiasm, or by solemn or majestic melody filling the mind with a sacred awe, then gently whispering a sweet and tender lullaby, which soothes and pacifies the soul. In 1720 Irish music was printed and published for the first time.

A WAIL UPON THE BREEZE.

War cries, meant originally to keep the fighting men aware of the place of their own clan in the battle, or when scattered in woods and hills, came down to the baronial period, and were used by the Anglo-Norman nobles out of consideration for their Gaelic retainers. The commonest shout was some name of a famous place or a famous man ,with the addition "aboo," a word well fitted for the clamour of a band of fighters, being at once more musical and less wearying to the voice than our "hurrah." The Kildare retainers cried "Crom aboo" in honour of Crom Castle, a citadel in county Limerick, originally a stronghold of the O'Donovans, which one of the Geraldine families named after the town of Kildare. The O'Neills cried out, "Lamh dearg aboo!" because the Lamh dearg, or Red Hand, was the badge of the family and clan. The O'Briens cried, "Lamh Laider!" or "Lauder aboo!" or "Strong Hand aboo!" The O'Donnells, "O'Donnell aboo!" The translation of Geoffrey Keating's "History of Ireland" suggests as the meaning of "aboo" the word "booa" victory; but analogy would point rather to "boa" ("beotha"), lively, awake, spirited, when "aboo" would be an exclamation like the French "alerte!" and "vive!" A parallel in Irish is the well-known "Erin-go-bragh, Erin till Judgment Day!" where "go bragh"—for ever— inplies the same idea of living which the word "beotha" actually contains, since the latter is the Celtic equivalent of Greek "bios." "Yabu!" is the exclamation of Tartar horsemen when urging their steeds forward. While on this topic it may be interesting to note that this Irish word, or its Welsh equivalent, "yu byw," corrupted to "boo" and "boh," is found in our colloquial expression, "He doesn't dare say boo to a goose," in other words, he is too cowardly to sound his war cry in the presence of the most peaceful of birds at his gate.

Tally-ho is the Norman hunting cry—"To the coppice." It was raised in the chase when the red deer was viewed in full career making for the wild-wood. It is raised when hound and horn are heard in pursuit of the fox as he breaks cover from the coppice in Connaught at Noel-tide!

"WE'LL ALL GO A-HUNTING TO-DAY."

COLOUR PHOTOGRAPHY.

Throughout the country photographers are interested in the discovery of S. B. Hargreaves, an architect and photographer of Indianapolis (according to the St. Louis "Globe-Democrat"). Hargreaves has uncovered the secret of colour photography, and recently, before an audience of prominent scientific people of the State, demonstrated its process and its accuracy. The demonstration was conducted in the photo-engraving department of an Indianapolis newspaper, and proved beyond doubt that the inventor has achieved success in discovering the secret which has heretofore baffled all photographic investigators and experimenters.

Hargreaves' discovery was due, in the first place, to an accident. While engaged in the work of making exposures by means of the wet-plate process he accidentally spilled a coat of sensitive solution over the surface of a thin plate mirror. This aroused his curiosity as to what action the light would have on a mirrored surface coated in this manner, and Hargreaves accordingly placed the coated glass in a plate holder, and exposed it in the usual manner.

On flowing, the negative thus secured with a developing solution he was surprised to see a sharp, clear image suddenly appear on the mirror brilliantly coloured with all the colours of the object he had photographed.

Before he could recover from his bewilderment the colour slowly faded from the plate, leaving only a blackened film, with patches of a bright mirrored surface showing through here and there. This action of the chemicals aroused in Hargreave's mind a series of questions, the solutions to which he immediately set about to discover.

What had produced the coloured image? Had he really discovered the process of colour photography so long sought for?

What caused the colours to immediately fade? Hargreaves went to work to complete his accidental discovery.

After a series of unique experiments he has been successful in perfecting the long-sought-for art of colour photography.

His patent papers have been granted, eastern capitalists have agreed to finance the manufacture of the invention, which will, within a short time, be placed upon the market.

The possibilities of this wonderful invention are most extraordinary.

By it the photographer will be enabled to produce exactly all of nature's most delicate colourings and tints, the gay colours of flowers, the brilliant plumage of feathered songsters, the gold of a sunset, the rich colourings of the world's masterpieces, and even the maiden's blush, without losing one iota of detail, expression, shadow, or colouring, just as it is portrayed to the human eye.

PYGMY CAMELS OF PERSIA.

The western part of Persia is inhabited by a species of camel which is the pygmy of its kind. These camels are snow white, and are on that account almost worshipped by the people. The Shah presented the municipality of Berlin with two of these little wonders. The larger is 27 inches high, and weighs 61 pounds. The other is four inches less, but the weight is not given.

Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

FETHARD, an incorporated market and post-town (formerly a Parliamentary borough), and a parish, in the barony of Middlethird, county of Tipperary, and province of Munster, 7 miles (N.) from Clonmel, and 78 (S.W.) from Dublin by Urlingford; containing 3,962 inhabitants, of which number, 3,400 are in the town and liberties. This place which appears to have derived its name from the Irish, "Faith Ard," the "summit or hill of the plain," is of considerable antiquity. In 1306 the friars Eremites of the Order of St. Augustine obtained from Edw. I. a full and free pardon for having acquired, contrary to the statute of mortmain, some land for rebuilding their monastery, which had been founded here at a very early period. In 1376 Edw. III. granted to the provost and commonalty certain customs, to enable them to surround their town with walls, and a similar grant was made to them by Henry IV. The monastery, to which was attached a certain portion of the town, was granted, on its dissolution, by Henry VIII. to Sir Edmund Butler, Knt., at an annual rent of 5s. 4d. Irish; and in 1553, Edw. VI. granted the burgesses a new charter, with liberties and immunities similar to those of Kilkenny, which was confirmed and extended by a charter of Jas. I., under which the town is now governed. In 1650, the town was besieged by Cromwell, to whom, after a short resistance, it capitulated on honourable terms; the original articles are still extant and in the possession of W. Barton, Esq., of Grove. It is irregularly built, and contains 626 houses; the inhabitants are supplied with good water from a public pump, and there are some extensive barracks, at present occupied by infantry. The old walls, in which were five gates defended by towers, are much dilapidated. The river Clashanly, or Clashaluin (more correctly Glaisealuin, "the lovely stream," from "Glaise," "a stream," and "Aluin," "lovely"), which rises in the bog of Allen, passes through the town, and gives motion to two flour mills, which, except in dry seasons, are constantly at work, and furnish the principal trade of the town. The market is on Saturday, but, from its vicinity to that of Clonmel, is of very inferior importance. Fairs are held on April 20th, Friday before Trinity Sunday, Sept. 7th, and Nov. 21st, and are well supplied with cattle; the Nov. fair is the largest in the county for fat stock. The town has latterly become a great depot for the sale of culm from the Slievardagh collieries, eight miles distant; it is calculated that 30,000 barrels, or about 5,000 tons, have been sold here in a year.

The corporation, by the charter of Jas. I., consists of a sovereign, twelve chief burgesses, a portreeve, and an indefinite number of freemen, assisted by a recorder, town-clerk, serjeant-at-mace, and other officers. The corporation, under their charter, continued to return two members to the Irish Parliament till the Union, when the borough was disfranchised, and the sum of £15,000 awarded in compensation was paid in moities to Cornelius, Lord Lismore, and T. Barton, Esq. The church is the remaining aisle of an ancient structure of which the chancel is in ruins; it is in the decorated English style, with a venerable tower (in which are four fine-toned bells), and an east and west window of very elegant design, and is 100 feet in length, and 50 feet in breadth. There is also a chapel attached to the Augustinian friary in the town, an ancient edifice with a very handsome east window, the beauty of which is concealed by a modern roof, which intercepts the crown of the arch. At Market Hill is a mineral spring; at Kiltinan is a subterraneous stream; and in the neighbourhood are the remains of many ancient castles, one of which, at Knockelly, occupies about one acre of ground, and is surrounded by a high wall with towers at each angle, and in good preservation.

THE INDUSTRY OF ALGERIA.

The wine industry at the present day constitutes the largest industry in Algeria. Until the last two years it had been going up by leaps and bounds, many large fortunes having been made. During 1900 and 1901, however, the price of wine steadily decreased on account of the abnormal yield in France, and great losses were consequently incurred by those who were forced to dispose of their vintage. The outlook of the wine grower in Algeria is much brighter this year, the crops in France having been greatly damaged by late frosts, wet, and severe hailstorms. The amount of wine exported from Algeria during 1897 was 781,558 gallons; in 1898, 796,049 gallons; in 1899, 945,879 gallons; and in 1900, 549,131 gallons. The other principal products are alfa, cereals, cork, vegetable hair, locust beans, olive oil, fruits, and vegetables, and Italian pastes. The area which alfa occupies in the three departments of Algeria is estimated at more than 12,000,000 acres The principal district, called the "Alfa Sea," is 210 miles by 95 miles, and is bounded on the north by the Tell, on the west by Morocco, on the south by the mountains of Ksowes, and on the east by the Hodna. The producing area is much greater than that actually cut; nevertheless, in order to prevent the loss which would result from bad working, the Governor-General issued an order in 1888 limiting the cutting, sale, and export of alfa. The average production of an acre of alfa is estimated at 8 cwt. after drying and sorting. In 1900 Algeria exported 1,650,235 cwt. of wheat, 1,883,153 cwt. of oats, 1,773,559 cwt. of barley, and 27,496 cwt. of maize. The barley is much in demand in Europe for malting purposes. Algeria produces excellent hard wheat, giving a flour rich in gluten, and consequently very good for the manufacture of Italian pastes and semolina. This industry is annually increasing; the existing works are enlarging and improving their machinery, modern methods of shop management are being introduced, and the output of the various establishments to-day rivals that of France and other countries.

WHOSE LIVES ARE WRITTEN.

An English statistician has figured that from 1000 A.D. to the end of the present century some 30,000 inhabitants of England have claimed the attention of biographers. Of the total adult poulation during these nine centuries one in every 5,000 has attained a title to distinctive commemoration. The ratio varied from century to century. From A.D. 1000 to 1700 the average ratio was one in 6,250; last century it rose to one in 6,000. This century it rises to one in 4,000.

OUR WEEKLY STORY

The MIRACLE of BALLYMOCHAN.

By ALICE M. BOYD.

Little Bridget Joyce sat at the door of her cabin letting the rays of the setting sun stream down on her bare head from a cleft in the mountains; not that she saw the glory of light that illuminated her pale, patient little face, for Bridget was blind, as indeed you could see by the way she stared straight at the slanting glow. Blind she had been for the twelve years of her small life, in an Irish cabin, far away in the heart of the Joyce's country away from civilisation, which meant more than perhaps it would to most of us were we blind, where people are taught those hundred and one little things that fill up their lives, if not usefully (which of us, after all, lead useful lives?) at least busily, and which prevent that endless sitting and waiting which made up the life of Bridget Joyce. For Bridget had never been taught anything—never been taught to use her slim little fingers as children are taught in the blind schools, not even to knit or spin, her natural lot, as wool was too precious to be wasted in teaching slow, uncertain fingers by some unusual method. She had never gone to the school where her brothers and sisters went, if not every day, at least often; for what would have been the use? National school teachers not being trained to pierce that blackness which seemed to separate one small soul from all humanity.

So, cut off from the great education which sight gives to every country child, the teaching of the sky and beasts and the growing things, the everyday education of living—a great training where one does one's own carding, spinning, dyeing, knitting, baking, cooking, and much farming. Bridget sat at the door of the cabin day after day, her little hands folded before her, waiting with all the patience of an Irish peasant nature. For what? She scarcely knew herself. To see if the Blessed Virgin would give her sight one day. For that the power was her's to grant it she knew as well as that she was blind; and if she did not grant it, 'twas that it would prove harmful to her soul. That must be the only reason why the Holy Mother, who was so close to her, would keep her wish from her.

This little wistful Bridget, so ignorant and backward in some ways, had her religious sense abnormally developed; for what had she to do all day but sit and pray—pray for sight, and sometimes, after a burst of natural childish impatience at her dull life, for patience—patience to bear what God's holy will sent her, and not repine.

The one event of her life was the going to Mass on Sunday, guided by her mother's protecting hand, or lifted over difficult places by her big brother Thady, the two most devoted to her in the family; and often on a cold Sunday in winter, when he would fain have stayed at home, Thady would go with his little sister to the chapel to give the child a bit of pleasure, repaid by the look of rapt devotion on her small face as she knelt by his side.

It was of the Blessed Virgin, too, and St. Brigid, her patron saint, and the will of God, that the neighbours spoke when they came near her, with the belief innate in every devout Irish peasant mind that any physical blight comes straight from heaven for the good of the soul.

Thus it came that all the power and energy of little Bridget's mind was centred on the unseen world, and there was a look of rapt saintliness on her pale face which made her look sometimes older than she really was, and sometimes so very childish.

Bridget raised her head and listened as she sat in the glow of the setting sun.

"There's someone comin'," she said to her mother, who was knitting beside her

"Is there so? 'Tis yourself has the good hearin', asthore. Shure I couldn't be hearin' anything at all, at all, so I couldn't."

"'Tis meself has nothin' to be doin' all the time, but larnin' to hear, so it is," said the child wearily. "'Tis small wondher I would be doin' it better nor you."

"So it is, agra," said the mother, tenderly, looking down at her little daughter. "An' shure 'tis yersilf is the good girl always. But mebbe now 'tis Mick O'Grady goin' home from sellin' his ass."

"'Tis not; 'tis the step of a woman, so it is."

"Is it so, then? Aye, ye're right," she added in a minute or two, "'tis Mrs. Coyne. Mebbe she'll be wantin' me to take some of her wool to sell for her to the pattern nixt week, an' she too ould to be going hersilf."

"'Tis a fine evenin', Mrs. Joyce," said Mrs. Coyne, as she came up to the door, and deposited a big bundle on the ground.

"'Deed an' 'tis a fine evenin'! Bridget, the child, heard ye comin' long since, and she says, 'tis the fut of a woman, so it is.'"

"'Tis the Holy Virgin is with her, for shure An' how are ye, Bridget asthore?"

"'Tis well I am, thank ye kindly, ma'am."

"The saints be with you!" ejaculated Mrs. Coyne.

"Well, Mr. Joyce, I just stepped up to see would ye be goin' to the pattern next week?"

"I will so. Is it anythin' I can be doin' for you?"

"'Deed I was wondherin' would you take this bit of wool for me to Tim O'Loughlin's, an' you with an ass?"

"Wid all the pleasure in life, ma'am."

"Then 'tis very thankful to you I am Mrs. Joyce, so I am."

"Sure 'tis nothin' at all," said Mrs. Joyce politely.

"They do be sayin'," continued Mrs. Coyne, "it will be a great day entirely, so it will be for goin' to the Blessed Well at Ballymochan the night before, an' it Our Lady's Day, so it will be. 'Deed an' I'm wondherin' sometimes you don't be takin' Bridget there to it, an' it so powerful for curing sickness."

"It is so," assented Mrs. Joyce.

"Mebbe the Blessed Virgin would give her sight to the child here, an' she prayin' so hard all the time, so she is, so as the Holy Mother would be thinkin' on her for sartin shure."

"That she might," said Mrs. Joyce, "an' they do be sayin' as 'tis wondherful the things as be done there. But 'tis a long way, and' 'tis on the ass she'd have to be goin', an' me an' Thady with her, an' how would I be gettin' the next mornin' to the pattern?"

"Shure enough," acquiesced Mrs. Coyne, "but 'twould be a great thing entirely so it would, an' 'tis like the Holy Mother would hear her, an' she so near a saint herself the child."

"Aye, the Holy Mother would hear her shurely," said Mrs. Joyce, "but I'm thinkin' if she didn't give her the sight of her eyes, an' it harmful to her soul, 'tis the child would be breakin' her heart afther it."

They had lowered their voices to the proper confidential pitch, but the ears that had been sharp enough to distinguish a woman's step before Mrs. Joyce could hear a step at all, did not miss a word of their conversation.

A new light broke in on Bridget. Was it this she had been waiting for all this time Would the Blessed Mother hear her prayers now if she went to the well? She had prayed so hard, so hard that sometimes she had seemed almost to touch the garment of some unseen presence near her, and it would not be for nothing. "It couldn't shure." Her prayers must be answered, if she could but reach the holy place.

But how to get to the well: that was the difficulty.

Bridget clasped her hands and prayed; her lips moving silently, and Mrs. Coyne, passing her a few minutes later, looked down at her, crossed herself, and murmured:

"The blessed saints be with her! 'Tis a saint she is herself entirely, so it is."

Bridget sat very quiet the rest of that evening and the next day, her lips moving in prayer, but after supper her big brother Thady took her up to the hill behind the cabin, scarcely needing to guide her, her feet knew the path so well. She and Thady sat up there on summer evenings, when he used to tell her stories to amuse her, and to bring a smile of interest to her little pale face. It is true a great deal of them she did not understand, they being mostly drawn from his own experiences, which came to him chiefly through his eyes, and such remarks as "You would have known 'twas the track of a water dog by the look of it, so you would," or "'Twas a brown colour, or just the colour of the scrochloch, so it was," conveyed nothing to Bridget, who had never seen the track of a water dog nor knew what was brown was. But she liked to hear it, and doubtless made some kind of meaning of her own out of it, by the light of her inner vision. But to-night she could hardly listen to what Thady was saying, and though she sat quiet by his side, her small hands folded in her lap, there were two bright spots burning in her usually pale cheeks.

All day long she had prayed with a kind of intense feverish hope, that some way might be shown her to make the pilgrimage to the well possible—some way out of the apparently impossible. For to her childish mind the difficulty of Thady and her mother getting to the pattern next day with the donkey seemed insurmountable.

A great deal of their livelihood depended on what they sold there, and the losing of it might mean something very near starvation for some months.

She had eaten next to nothing all day, so that her mother was frightened, and thought she was ill, and she hoped that somehow fasting might propitiate the saints, and towards evening what, with praying and fasting, a kind of mystic vision had come upon her, a state never far off the visionary Celtic nature, and it seemed to her that her prayers were to be granted.

She was sure there had been heavenly voices in the air, and once or twice it had seemed to her that angelic wings had brushed her cheek as she prayed.

"An' as he was walkin' on, shure a big red thing came towards him, so it did; 'twas as red now, mebbe, as the colour of the sky you'd be seein' in the evenin' time, so it was, or mebbe as the colour of your own dress, asthore."

"Was it so now?" answered Bridget, absently.

"But, Thady, agra, don't be moindin' the story at all now; 'tis meself would be wantin' to ax ye somethin'."

Thady stopped short, astonished. Never in the whole course of their existence had Bridget's interest in his stories seemed to flag, and he stared at her, wondering was she really ill, as his mother had thought. Then she looked so pathetic, and her lips trembled, so that he put his arm round her and drew her close to him.

"Och, thin, an' what wud it be, Bridget, mavourneen?"

She was trembling so violently she could hardly speak at first.

"Thady, agra," she said at last, "they do be sayin' as mebbe—och, thin, shure 'tis meself as would be likin' to get me sight like the rist of yis, so it is, an' they do be sayin'——"

"So it is, for shure," said Thady, soothingly. "An' what do they be sayin', asthore?"

"They do be sayin' as mebbe if I could git to the Blessed Well at Ballymochan the Holy Mother would give me me sight."

"The Blessed Well! Och thin!" and Thady stopped in sheer amazement. He had never thought of that before—never; but why not? Now he did think of it—there were wonderful things done there, and he felt so amazed at his own stupidity that he could think of nothing to say for some time, and then he repeated—

"The Blessed Well! Och thin, but why not, asthore?"

Bridget clung closely to him.

"Thady, 'tis the night before the pattern I'd have to be goin', which is Our Lady's Day, an' how wud I git there at all, at all? 'Tis not by meself I could be goin', twilve miles, an' a way I wouldn't be knowin', an' you an' mother an' the ass would be havin' to be at the pattern the nixt mornin'. Agra, 'tis that's the way it is, so it is."

Thady now saw the absolute impossibility of her request.

"Musha, darlin'," he said, "tis you can't be goin' at all at all."

"Och, Thady," persisted Bridget, her voice trembling, "'tis meself has been prayin' to the Blessed Virgin all the day, an' I do be thinkin' she heard me, so I do, an' was sayin' to me as how I should go."

At that moment Bridget did not feel so certain of the answer to her prayers. The misery of her small, white face irritated Thady, irritated him because he felt that he might help it. But he couldn't—no, he really couldn't—give up the pattern and its accompanying delights, so he grew suddenly angry and pushed Bridget from him.

"Och, thin, 'tis yersilf is the bould girl to be wantin' to go at all. 'Tis goin' aginst the Blessed Virgin, so it is, when 'tis harmful it moight be to yer sowl to be havin' your sight for all you can tell, or why else wouldn't you be havin' it now, anyway?"

Bridget felt as if a sudden dash of cold water had been poured over her, but she did not say anything for a moment, only clasped her hands tighter and clenched her teeth; then, after a silence, she said, sadly, but with pathetic docility:

"'Tis so for shure, mebbe." But dark sadness was in her heart, and she drew herself away and rose wearily. "'Tis meself will be goin' in now, I think, for 'tis a great sleep thre is on me; I think 'tis to bed I will be goin'."

In the middle of the night Thady was wakened by stifled sobs. He tried to harden his heart for some time; but his little sister was very dear to him, and, slipping over to her, he took her in his arms and said he would go with her to the well, so he would, for mebbe it was the blessed saints were wishin' it, an' it was not for the pattern he cared at all, so it was not," and Bridget fell asleep in his arms comforted.

Thady, having once given up the pattern, was filled with the virtue of the sacrifice, and worked hard to remove the other difficulties in the way. He walked ten miles one evening to borrow a donkey from a man who was the happy possessor of two, and it was willingly given when the object was known.

In the evenings he and Bridget went up to the hill behind and talked about their plan, and Thady was amply repaid by the happiness on Bridget's face as she listened to his arrangements with rapt attention.

All that week she lived in a kind of mystic ecstacy, praying almost without ceasing from morning till evening, or, if sometimes definite intercession seemed to fail her, she knelt on in a kind of rapt communion with the unseen. She fasted rigorously to prepare herself and make herself fit for this great event of her life, for the miracle which she grew ever more certain day after day would take place, which was to transform the long weariness of her life up to this into a blessing and a joy.

Her pale face grew even paler and smaller under the discipline, but her sightless eyes grew larger and brighter and seemed filled with some spiritual light.

Her mother caught the infection of her devotion, and determined that she, too, must go with her daughter to see the miracle performed; so she induced a neighbour to undertake the charge of her donkey and its burden to the pattern.

Once only did Mrs. Joyce's maternal fore-

sight and terror for the grief the child might be laying up for herself if perchance the Blessed Virgin did not think fit to grant the miracle make her draw her towards her suddenly as she was passing to her prayers, saying, "Sure now, Bridget, agra, if the Holy Mother didn't think right, mebbe, to give you the sight you would be knowin', asthore, that 'twould be for the good of your soul, so you would."

"Och, mother!" cried Bridget, stepping back and putting up her hands to her head, and then, after an effort at self-control, she dropped them, saying slowly, "I wud know for shure, so I wud, that 'twouldn't be for the good of me soul."

But the piteous look of pain on the child's face went through Mrs. Joyce like a knife, and she never ventured to say another word to discourage her.

. . . . . .

It was a heavy, sultry afternoon when the three started on their pilgrimage; Bridget and her mother taking turns on the donkey, and Thady walking beside; but Bridget hardly seemed to notice whether she walked or rode, as her lips moved in silent prayer, for though the really efficacious thing was the station that was to be performed at midnight at the Blessed Well just before the miracle would be performed, to Bridget it all seemed to begin from the moment she left the cabin door.

The traces of the week's fasting and praying were on her small white face, and her look of rapt exhaltation made her more like some early Italian madonna than anything else. She seemed so frail and spirit-like that her mother often looked at her, anxiously wondering would her slight body last through it, but comforting herself with the reflection that she was in the keeping of the saints.

They reached Ballymochan at about ten o'clock at night, and stopped at a small public-house for rest, but Bridget could not be prevailed upon to take anything, but felt her way to a corner of the room and knelt down till they should be ready to take her to the well.

"'Tis for the child, thin, that you'd be goin' to the well, is it?" asked a man, pausing to look at the little figure. "Sure 'tis wondherful the sickness that does be cured there, so it is, an' the Holy Virgin will hear, an' she more like an angel than a child, so she is."

After a time they came and told her it was time to go.

It was a stifling night as they started, breathless and heavy; distant rolls of thunder began to be heard in the distance.

"'Twill be a thunder storm for shure," said a man at the door. "Is it not frightened you'd be to be goin' to the well on a night like this?"

"Och, thin," said another, "what harm would there ever be in it at all an' the Holy Virgin there herself; 'tis not likely as the thunder would ever come within a mile of it."

Several people were already assembled at the well when they arrived. It was a small well in the rocks with a kind of rough shelter put up over it to protect an image of the Virgin decked out according to the rustic idea. All round were offerings of the devout—bits of rags from the wounds that had been healed; crutches left there by those who had come lame, but gone away without need of them; old things of every sort necessary to the sick, and now dispensed with and left as pious offerings. It looked weird and impressive enough, lit up with lamps and a torch on this night of nights in the year, when Our Lady would surely visit her own well and grant the prayers of the faithful if they were ever to be granted in this world at all. Deathly still it all was but for an occasional half audible prayer and the distant roll of thunder coming to them nearer and nearer on the breathless air. Some of the people look anxiously at the sky.

But Bridget seemed unaware of it all. With a look of expectant conviction she went through her station, led from one spot to the other by her mother and Thady, ever ready and watchful to lead her to the next when she rose from her knees.

She knew that the saints were with her—round her—she felt again the brush of angelic wings; music, too, there was like the music she heard in the chapel on Sundays; and voices, surely the voice of the Blessed Mother telling her to go forward and have faith, that she was near.

She rose at the end of the last station with clasped hands, paused for just a second, and then without waiting to be led walked quickly forward. Some new instinct or intuition seemed suddenly to awaken in her. She went straight to the foot of the shrine, fell on her knees, and raising her clasped hands and rapt face to heaven, she cried aloud suddenly—

"Holy Mother of God, if it so be yer blessed pleasure, let me sight come upon me!"

There was a general stir. Her mother and Thady fell on their knees, too, startled into excitement by the sudden cry.

Then suddenly a dazzling flash and a crash, and Bridget started to her feet with a cry.

"Och! Mother of God, the sight is on me; so it is. Och, Mother! Thady! 'tis meself has the sight!"

Mrs. Joyce screamed—"Och, Mary Mother, 'tis the Holy Virgin has heard the child! Och, 'tis meself saw the flames from heaven on her."

"A blessed miracle!" cried one.

"'Tis meself saw the flames an' light all about her!"

"The Holy Mother be praised; 'tis myself saw it, too!"

Bridget covered her face with her hands, and sank on her knees. A sudden terror came upon her, and she pressed her hands tightly over her eyes, unwilling to take the blessing sent from heaven till she was sure it was lawful. Her mother's words rushed suddenly into her mind with deadly vividness. Would she take this thing if it was to be in any way harmful to her soul? Might not her prayers have gained this thing even to her soul's harm; and might it not even now be put before her as a temptation to thrust aside?

In the silence and darkness that followed the strange flash, Bridget's voice rose suddenly clear, trembling a little at first and then steady, but filled with the anguish of sacrifice and renunciation, of renunciation of everything that would make life bright for her.

"Holy Mother of God, if so be that the sight would be harmful to me soul, take it from me again."

A short silence—another flash and crash—and amid the sudden torrent of rain that followed, Bridget took her hands from before her eyes.

Darkness! black, utter darkness; she couldn't see any of the lamps on the shrine that she had always heard were there. She could see nothing at all any more than she had seen all her dark, weary life.

Was this to be it then? Her wish had been sin, and her sight had left her again. She had had it just for that moment. She was clear about that, quite clear; and it was of her own free will she had offered it back. And was she not quite willing? Surely she was not so sinful as that; but her dark life for ever after.—Then clear before her rose the one bright, beautiful fact, the miracle had come. She had been singled out. The Holy Mother had spoken to her, and Heaven seemed near.

Then she collapsed. The strain of the past week told now that the excitement had passed, and she fainted away.

When Bridget recovered consciousness, she was lying with her mother's arms round her in a little shed by the roadside, whence she had been carried for shelter out of the downpour of rain. Most of the pilgrims were gathered round her, forgetful for the moment of their own individual sorrows in the excitement of the miracle.

At first she did not quite realise what had happened; only a sense of calm and the nearness of Heaven seemed about her, and then she gradually remembered all. The miracle and the sacrifice. The sacrifice which gave her a sense of dedication to Heaven, and the knowledge that life would never seem quite the same to her again; never quite so narrow and dull, for had she not been chosen out and been in close communion with Heaven? She felt her mother's arms around her, but vaguely fancied at first that it was the Blessed Virgin enfolding her so tenderly in comfort and recognition of her sacrifice, and all sense of disappointment was effaced in the glad sense of a spiritual victory won.

She was recalled to her surroundings by her mother's awed voice.

"Bridget, agra, is the sight on ye asthore now?"

"Arrah no," she answered dreamily, "shure didn't I give it back to the Blessed Mother an' it harmful to me sowl"

But Mrs. Joyce's sense of disappointment was keen. It seemed to her as if Heaven had taken an unfair advantage, and she burst into tears.

Bridget sat up, and stretching out her arms drew her mother towards her.

"Hush now, mother asthore, 'tis meself is glad entirely, so it is, shure is it me sight I'd be havin' an' it harmful to me sowl. Shure didn't I pray to the Holy Mother to take it back from me if it was hurtful to me? so I did, an' 'tis meself wud do it again. Och, 'tis a great joy an' gladness that is on me this night!"

Such intensity and conviction vibrated in her voice and shone on her pale little face that her mother was awed into silence.

So little Bridget Joyce went back to her mountain home, having attained by one simple moment of exaltation the knowledge that takes the wisest of us sometimes a lifetime to learn—namely, that through self-sacrifice we may possess, if not happiness, at least spiritual illumination—back in perfect peace and contentment to sit with patient folded hands waiting, not now for earthly light, but for the light of those heavenly faces which had been so certainly near her on the night of her miracle at Ballymochan.

Once sitting with her in their favourite seat on the hill behind the cabin. Thady ventured timidly to say to her:

"Bridget, mavoureen, what was it ye saw whin the sight came on ye anyway?"

Bridget was silent for a long time, and then said, "Arrah, thin, how could I say now at all anyway, for 'twould be hard to be knowin' just all of a minute like. But there was an awful noise in the thunder as seemed for to shake me through an' through an' brought the sight on me eyes; an' thin, sure, Thady, agra, I put me hands over them, an' me fearful of the sin mebbe: so how could I be tellin' what I saw only just that I knew the sight was there, so I did for sartin shure."

And Thady, feeling that these things were too subtle for him, said no more.

HOW SMALL IS AN ATOM?

This question, to the solution of which Lord Kelvin has more than once applied his mind, has just received a new answer, presented at a meeting of the Physical Society in London, by Mr. H. V. Ridout. The form of atom dealt with by Mr. Ridout is the smallest particle of matter that can take part in electrolytic action, and is sometimes called an ion. A number of ions go to make up an ordinary atom. Taking the element hydrogen, Mr. Rodout concludes that, in round numbers, 114,500,000 dissociated atoms, or ions, are necessary to form a line one centimetre long. In other words, the diameter of such an atom is about one two-hundred-and-ninety-millionth of an inch. Lord Kelvin, after listening to Mr. Ridout, said the diameter of an ion, as above described, was almost exactly one-half of that which he himself had obtained for a molecule of hydrogen.

KILKELLANE.

Sir—Mr. Owen Bresnan has sent me several valuable items concerning the parish of Kilkellane, which is termed by Lewis, Kilkellane, or Kilcullane, and appears on 'Ordnance Map as Kilcullane. On Ordnance Map the site of the Castle of Kilkellane is marked, which Lewis says was erected in the 15th century by the O'Hurleys,, who were a powerful family in this district, and built several castles in this part of the county of Limerick.

Mr. Bresnan says that there is a well in Kilkellane parish named Tobar Cellain, or Well of St. Cellan, but Cellan is a diminutive form derived from Cell; and as Kilmallock or Cill-Mochellog means church of my Cellog, or of my little Cell, it appears to me that Mochellog of Kilmallock and Cellan of Kilcellane may be the same. In "Calendar of Oengus," p. lxv., we read: "Mo Chelloc (my little, or dear, Cell) i.e., of Cell da Chelloc (Kilmallock) in Ui Cairpri in Munster, sed verius est quod Cillin (little Cill or Cell), son of Cael Odran of Cathair Conchaid." So very little is really known concerning Cellan, Cillin, or Cilline of Kilmallock that his connection with Kilkellane is very interesting.

In the "Life of St. Findchua of Bri-Gobann" near Mitchelstown, in Cork, it is stated that Cairbre Crom, son of Crimthann, King of Munster, was fostered in Cell Cromglaise (Church of the bent stream) by Scellan, and perhaps Scellan, which is a diminutive form of Scell, may be the same as Cellan; for in "Calendar of Oengus," p. cxi., we have Forsluag Scillitarum written, also Lasluag, Scellitarum, and Laslog Chillitarum. Cell Cromglaise has not been identified, but the river of Kilmallock is named Lubach, or "bent," while the river of Kilcellane is named Camog, a diminutive from Cam, "bent." In the "Life of St. Findchua" it is stated that the clans of Niall of the North pitched their camp at Loch Siglenn (or Silenn) in Gort Clainne Neill ("field of Niall's clan"), where a victory was won from them by the Munstermen, led by Findchua and Cairbre Crom, and Loch Silenn, from the heads of the slain warriors of Clan Neill being cast into it, was named Loch Cenn, or "lake of the heads." In the "Book of Rights" it is stated that on the island of Loch Cenn was one of the royal forts of Munster, and in "Chronicum Scotorum," under year, A.D. 856, it is stated that the principal lakes and rivers of Erinn were rendered passable to pedestrians owing to great ice and frost, and that Gorman, son of Lonan, royal heir of Cashel, was slain by the Foreigners, as stated in "Annals of Four Masters, A.D. 853, where O'Donovan's note concerning Loch Cenn is incorrect, for Hennessy ("Chronicum Scotorum") says that Loch Cenn formerly existed to the north of Knockaine. Mr. Bresnan has identified the site of the lake in Kilkellane, and portion of the site is now named Ragamus, or place of horse-radish. The lake was formed by an overflow of the Camog river, and Mr. Bresnan says that there were two crannoges in the lake, the site of one being now called the Island, occupied by a farm house of Mrs. Grace O'Ryan, while the other is called Cnoicin Ceann, or "hillock of the heads," or hillock of (Loch) Ceann.

In "State Paper," A.D. 1200, Kilkellane is mentioned: "From the ford of Scivil towards the east, with the whole marsh to Kilkillin, and Kealkillin itself, the grange of Cathercormi (recte Cathercorni, now Cahircorney), Salcuarin, Bali Ichudin, Bali Inacalligi, from the ford of Crether to Crangulligin, Makelkellan (plain of Kilkellane), and the ford of Seagainlag, the grange of Locgeir (Lough Gur), a moiety of Dungeir (now Knockadoon), the island which belongs to the vill of Locgeir." In "State Paper," A.D. 1288, we read: "John Dandun, 1 knight's fee in Kilkellane, rendering 1 pair of furred gloves or 6d., with suit as above. Nicholas de Pierpoint, 2 carucates in Loychgyr (Lough Gur) by the service of 16d., when, etc., with suit as above, and 1 carucate in Bolger rendering to the Bishop of Emly 5 marks a year without suit." Near Tobar Cellain, but at opposite side of the river, Mr. Bresnan says that there is a large stone circle very similar to the one, about eighty yards in diameter, which is on the summit of the hill of Killalough, close to the southern margin of Lough Gur. Beside the margin of Loch Ceann quantities of human bones have from time to time been found. Close to the public road, and west of Kilcellane Church, is a height, called Clogher, from a high crag which was quarried away some years ago by road-contractors; and a little south of Tobar Cellain is a rock named Carrigacurra. Mr. Bresnan says that the people of Kilcellane have a tradition that the Church of Kilcellane was built at a very early period, and that there was a Franciscan friary there, the foundations of which extend from the present ruinated church to the river. A little to the east of the site of Kilcellane Castle Mr. Bresnan has found sites of the two earthen forts, raised, he considers, for protection of the ford, which may be ford of Seagainlag of State Paper, and at opposite side of river, and on hill named The Faheens (plural diminutive of faitche, "a green"), there is a site of a large rath. Mr. Bresnan has traced the site of the old road which passed over ford, through Kilcellane, Cringer, Kilballyowen, Baggotstown, Gormanstown, Bulgaden, to Kilmallock. On the island of Loch Ceann have been found some beautifully carved stones and stone axes.

The island of Loch Cenn is mentioned in "Cogadh Gaedhel Re Gallaibh," p. 140, as one of the royal forts in Munster which were repaired by Brian Boroihme, and these are the names of the forts: Caisel na righ, Cenn Abrat, Inis Locha Cend, Inis Locha Gair, Dun Eochair Maige, Dun Cliath, Dun Crot, Inis Locha Saiglend, Inis an Ghaill Duibh, Ros na Righ, Cenn Coradh, and Borumha; but in this list as given by Keating, Inis Locha Cend appears erroneously as Inis Locha Ce, and Dun Cliath is named Dun Cliach, the fort of the district of Cliu on Knockaine, the site of which has been noted by Mr. Bresnan in "Dublin Penny Journal," when describing the monuments of Knockaine. Dr. Whitley Stokes, in his Index of places and tribes mentioned in "Lives from Book of Lismore," says that Loch Sileann (or Siglenn), mentioned in the "Life of St. Findchua," is Lough Sheelin, on the borders of Cavan, Longford, and Meath, but this is an obvious mistake. According to "Silva Gadelica" and "Battle of Ventry," there was a hill above Ventry Strand named from Siglenn. I think that the two names, Cellan and Scellan, are quite different; but it has occurred to me that as the two are so alike, that some confusion may have arisen, and I have not been able to obtain particulars of Scellan, who is mentioned by Canon O'Hanlon in "Lives of Irish Saints" at April 11th, and in Donegal Martyrology. In the "Calendar of Oengus," p. xlviii., Hui Scellain of Sliabh Mairge in Queen's County is mentioned. In the "Genealogy of Corca Laidhe," p. 19, Scellan, Colman, and Finan are said to be sons of Al, son of Eidercel; and at page 32 there is a Scellan noted, who is son of Erc, son of Eoghan, son of Conall Claen, son of Geran; and in "Lives from Book of Lismore," p. 336, Brig ingen Amalgada and Cillini and Cellan are connected with Achad Æda; but here Cellini and Cellan are the names of holy virgins of St. Brigit of Kildare Many Irish names are, however, equally applied to males and females, and this will not militate against the equation of Cellan of Kilkellane with Cellin of Kilmallock, and the diminutive terminations, an and in, are the same; for instance, Bulgadin, near Kilmallock, is a personal name derived from Bolg, "a sack," and is in old documents written Belgadan, that is, "little sack-bearer." The ford of Crether, mentioned in "State Paper," is probably to be identified with the ford across the Camoge river, where is now Cloghansoun Bridge. There is a clochan or row of stepping-stones here, and Samhain games were practised here; and hence Cloghansoun. Mr. Bresnan has also traced a row of pillar-stones from the Megalithic monuments on Knockroe, at north-east side of Lough Gur, to Cloghansoun.

In "Genealogy of Corca Laidhe," p. 41, Sigeang is said to be daughter of Fermora of Ara Cliach, and at page 59, the three Fothadhs are the three sons of Fuinnche, daughter of Nar, son of Formora of Ara Cliach, and ever since the site of Loch Ceann which is so close to Knockaine and Knockdere has been made out so accurately by Mr. Bresnan, I have thought it highly probable that it is with Loch Cenn ,or Loch Siglenn, that Sigeang, Fermora and Fuinnche were connected by the old Pagan folk of Ara Cliach. I have noted in a previous article that Fuinnche, who is identified with Liban, is connected with Lough Neagh by the Pagan folk of the Ultonian Ara. I do not think that Nar, the father of Fuinnche of the Momonian Ara, is the same as Eochu, the father of Fuinnche of the Ultonian Ara; but if your readers will examine the mythological notes already given, they will find that Fothadh, which is one of the most important names in the mythology, is also connected with the two Aras. Sigeang appears to me to be an extension of Sigean by means of the guttural, which extension is not so common as that by means of the dental, and we thus get Sigean, which is certainly from the old name Sig, or Sid, mentioned in several old tales; and to this word Sig I also refer Siglend, or Sigliu, the old name of Loch Ceann, just as we must trace the old name Ethlend or Ethliu, Cethlend or Cethliu, to the old words, Et, and Cet.

Dr. Joyce ("Irish Names," vol. i., p. 356), says that Assey (Ath Sidhe), on the Boyne, was named from Sidhe, the son of Dian, and father of Sin, Connected with Cletty. In "Bodleian Dinnshenchas," p. 46, Cletty is said to be named from Clettech, son of Deagha (or Deadha), son of Sin; and in "Trans. O.S. Soc., vol. v., p. 289, Professor Connellan, who has taken his account of the Erne or Clanna Deaghaid (Children of Deagha) from O'Flaherty; and Keating says that the Children of Deagha, located in Munster, were descended from Deagha, son of Sin, son of Ailell of Ara, son of Fiach, son of Aengus Tuirmeach, located in Ulster. Ca Roi of Tara Lupachra is said to have been son

if Daire, son of Deagha, son of Sin, son of Ailell of Ara.

In MacLiag's poem given by Connellan ("Trans. O.S. Soc., vol. v.), it is stated that the Fir Bolg obtained possession of Brugh na Boinne, Cnodba, Tailltin, Tlachtga, Ath Sidi, etc. Ath Sidi means ford of Sid, or Sig, and these three names, Sid, Sig, and Sin, are forms of the same old word, though Sid and Sin are made distinct in the tales. In "Todd Lecture Series," vol. iii., p. 399, we read: "I have fear respecting the woman, namely Sin, daughter of Sig." In "Chronicum Scotorum," p. 42, Hennessy says that Sin was a fairy woman, and refers the reader to "Annals of Four Masters," p. 173. Hennessy explains Sin as storm, but this cannot be accepted, for the variant forms, Sig and Sid cannot mean storm. Perhaps the Dun Sige, or fort of Sig, mentioned in the extract taken from the poem of "Dubhthach Ua Lugair," may have been in Kilkellane; and at any rate Dun Sige lay between the river Suir and Knockaine. O'Curry ("Lectures," p. 286), refers to Siogmall, that is, great Sig, or Sid, of Sidh Neannta in present county of Roscommon. This name Sid, Sig, or Sin, must not be confounded with Sid, a sacred mountain, or mountain deity. Dr. Joyce ("Irish Names," vol. i., p. 304), says that the old name of Templeshanbo, in Wexford, was Seanboth-Sine, the old hut of Sin, which, he says, is a woman's name belonging to the Pagan period. O'Donovan ("Boyish Exploits of Finn") says that "Finn had a sister named Sid, who was proverbial in Ireland for her fleetness of foot, and who was the mother of Caoilte Mac Ronain, also famous for his agility. He had another sister Seogen, who was the mother of Cobhthach, son of Crunnchu." Crunnchu and Ronan appear to be the same, though Crundchu is sometimes made son of Ronan, but Caoilte is often said to be son of Crundchu; and I think that Sigeng, that is, Sigen, may be equated with Seogen. Professor Kuno Meyer ("Battle of Ventry," p. x.), quotes from a poem by "Gilla in Chomded," an account of the birth of Caoilte, son of Sid, the sister of Finn, and the daughter of Cumal. Sid is said to have run a race against the swift horses of Eoghan Mor in the Oenuch of Colman, and immediately after winning the race Sid gave birth to Caoilte. Professor Meyer thinks that this tale has been borrowed from the heroic cycle and transferred to a favourite hero of the Ossianic cycle; but it does not appear to me that Munster has borrowed this tale from Ulster; and I think that the tale of Sid and the tale of Macha have a common source, unless the tale has been transferred from the Fenian to the heroic cycle, for the Fenian cycle is much older than the heroic cycle; and in the so-called Ossianic poems there is material belonging to the oldest period. We have in this district of Ane Cliach preserved by local tradition alone tales of Fer Fi and Ane of Cnoc Aine, and what can be produced from the heroic cycle, which will rival Gar of Loch Gair and Ane of Cnoc Aine; and without the slightest reference to the tale of the Emuin of Macha the character of Sid may be obtained from this tale of the Oenuch of Colman, where was laid to rest kings, and priests, and warriors of ancient Mumu, in their dolmens and stone circles, before Rome was built, or Troy was burnt.—Yours faithfully,

J. F. LYNCH.

HONDURAS RUBBER VINES.

In the Pija Mountains, Honduras, grows vines varying in diameter from four inches to two feet, and attaining a length of 100 feet, from which can be obtained a gum resembling that yielded by the india-rubber trees. Senor Davidi, the governor of the department of Comayagua, recently visited the region where the vines abound. He says that they thrive at great elevations as well as at lower levels in the valleys, and in his opinion the rubber produced from them is superior in quality to the Para article.

NOTES AND QUERIES.

IRISH PLACE NAMES.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Sir—W. Martin will find the name Glasnevin explained as "Streamlet of Naeidhe," and Glasthule as "Streamlet of Tuathal," in Joyce's Irish Names, vol. 1, p. 456. I also venture to suggest to the Rev. F. R. Montgomery Hitchcock that it would much increase the value of his articles if he gave the sources from which he quotes. He tells us, for instance, that Magh Breagh means Plain of the Wolf, but Dr. Joyce says that Meagh Breagh means delightful plain, adopting in his text the explanation given in the Annals of Tighernach, but in note he says that the name must mean Plain of the Bregians, and refers to Crowe's note in Kilk. Arch. Jour., 1872, p. 131. In Bodleian Dinnshenchas, p. 5, the name of the plain is connected with Brega, the name of the ox of Dil, and with Breogan, the eponymous ancestor of the Brigantes.

"Magh Breoga, plain of our origin,
As far as Tuaim Brobain without weakness.
The eldest of the heroes over seas
Breoga (Brega) overcame the Brega (Bregians),"

The name of Breogan, from whom were named the Brigantes, is merely an extension of Breg, which in the tales have various forms, such as Brath, Bruth, etc. In Silva Gadelica, p. 529, we have Brath Mac Dedath, and in Silva Gadelica, p. 523, Brath Mac Detha, for Dedath and Detha are variants of the genitive case of the same name. The Brega and the Brigantes must consequently be equated, and hence the reason why in the article on Magh Femin I drew attention to the plain near the town of Tipperary named from Breogan, to the mention by Ptolemy (130 A.D.) of the Brigantes of Tipperary, to the name Dil, and to the royal oxen, etc. Those names are of extreme importance. Mr. Hitchcock also tells us that Ely O'Carroll derived its descent from Eile, or Ely, seventh in line from Cian, a son of the famous Oilioll Olum. The discovery of the monument of Oilioll Olum was given in the "Dublin Penny Journal," and I also explained that Eile is the genitive case of Fial, who in "Corca Laidhe," p. 61, is made daughter of Eochaid Mac Luchta, and from her it is stated that the district of Eile, or Ely, is named, and there is no appeal from "Corca Laidhe." So though Dr. Joyce, in "Irish Names," says Ely O'Carroll and Ely O'Fogarty were named from Eile, the seventh in descent from Cian, we must accept the explanation given in "Corca Laidhe."

Yours, etc.,

J. F. LYNCH.

IRISH NAME CORRECTIONS.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Sir—Your correspondent, the Rev. Montgomery Hitchcock, in his interesting article on the O'Carrolls of Ely, explains "Feara Ceall" as the "men of the churches." It is no such thing. It is "men of the wood," or "of concealment," if you wish, and the succeeding part of the paragraph states as much.

In a former article of his he also makes a rather serious mistake of mixing up the name "Grania Maol" with that of the no doubt excellent lady who was the wife of the Chief of Clan William. "Grania Naol" means "noble Grace" or "Grace of the heroes or nobles," and is a poetic name for Ireland, and altogether quite a different name to that of Grace OMalley (Grania ni Maille). It is true that English-speaking, people, ignorant of the Irish language, have mixed up those two names, the mistake arising in reality from the barbaric English spelling of the lady's name.

This should be no excuse for the Rev. Mr. Hitchcock, who is, no doubt, well acquainted with the language of the Gael, as with the history of the leading families.

EIREANNAC.

March 1st, 1903.

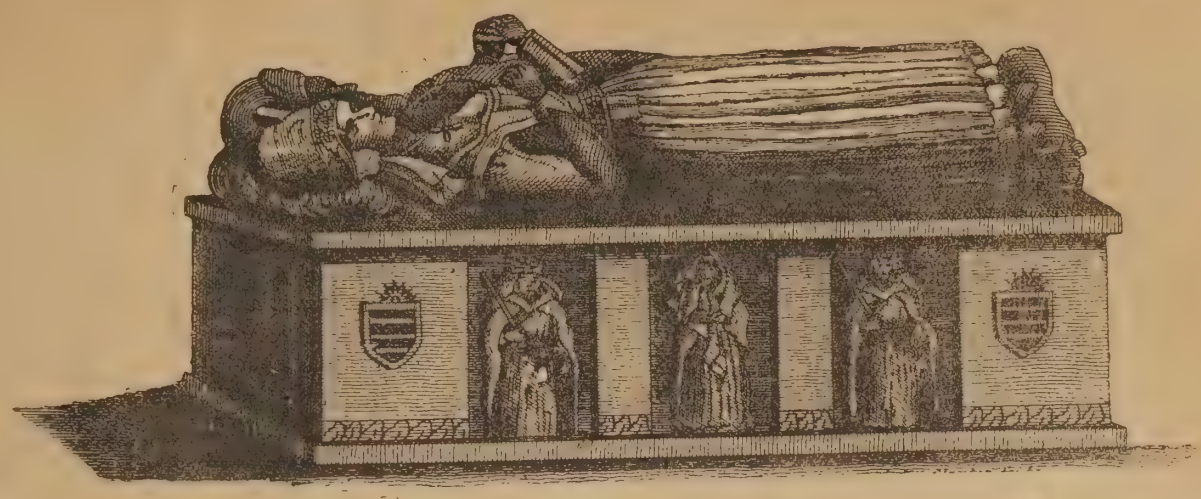
"ASTRONOMICAL OBSERVATIONS."

TO THE EDITOR DUBLIN PENNY JOURNAL.

My Dear Sir—It may be kind to you, in the interests of science, to point out a considerable error which the writer of the article, entitled "Astronomical Observations," fell into in the last issue of the "Dublin Penny Journal." He says the diameter of Neptune's orbit is five billion of miles (5,000,000,000,000). If he had said five thousand millions (5,000,000,000) in round numbers, he would have been nearer the mark. To do such a journey the express train would want a little over ten thousand years.—I remain, dear sir, yours faithfully,

E. A. SELLEY, O.S.A.

St. John's Priory, John st., W., Dublin,
March 3rd, 1903.



IRISH HANDPRINTS AND FOOTPRINTS IN STONE.

TO THE EDITOR DUBLIN PENNY JOURNAL.

In an article entitled "Stone Markings," contributed to the "Antiquary" for May, 1891, by the late Miss Margaret Stokes, of Dublin, the following extract originally appeared:—On the occasion of a late visit to the monastery of Bobbio, in the Appennines, founded by the Irish Missionary, St. Columbanus, in the sixth century. I was taken to see a rock on the summit of a mountain called La Spanna, near the cave to which the saint is said to have retired for prayer and meditation. The impression of the saint's left hand is still shown upon the face of this rock, which stands at the boundary of the province of Pavia. The healing power of the patron's hand is believed by the peasantry of the surrounding country to linger still in this hollow marking, and many sufferers have found relief from laying their hand within its palm. Handprints of saintly or divine beings are not so often found as footprints; and, therefore, I looked at this stone-marking with peculiar interest. We have found two instances of veneration for footprints in Ireland. On the Island of Inismurray the imprint of a child's foot may be seen on the right hand of the entrance to the station called Trahanee. The legend is as follows:—"A poor woman carrying her load of kelp along the shore of Inismurray suddenly beheld a Lady of divine beauty and majesty, holding a radiant Child by the hand, who stood on a slab of rock at her feet. The woman, terrified by the vision, dropped her load, and fled to a neighbouring cottage, where she told what she had seen. On returning to the spot, followed by a number of the islanders, they found that the Lady and the Child had vanished; but the mark of the Child's footprint remains to the present day. The other instance is that of an inscribed tombstone in the churchyard of St. Caimin's Church, Iniscaltra, or Holy Island, Lough Derg. It was discovered by the late Sir Thomas Deane in the excavations of the churchyard of St. Caimin's Church in Iniscaltra, when carrying on the works for the preservation of the national monuments and ecclesiastical buildings under the Board of Public Works, 1878-9, and was since stolen by a party of American tourists. This stone was adorned with an Irish cross, and bore the name Cosgraoch Lagnech, with the prints of two footsteps deeply indented in the stone. A stone is said to have been preserved to a late date at Lismore (Co. Waterford), on which the head of the infant Cathaldus, afterwards Bishop of Taranto, in Italy, left its impress, the child having fallen on this stone at the moment of its birth. A similar story is told of the Irish St. Silao, or Sillan, who died on a pilgrimage at Lucca (Italy) in the sixth century. "Miss Stokes was unaware that at a few yards from the old Carmelite Abbey at Kinsale, Co. Cork, is a well in which a stone bearing the mark of a human foot was found. The story goes, that in a time of great scarcity of water one of the monks observed water springing up out of the ground. He went about digging it, and in so doing found the stone, on which was plainly indented the mark of a human foot, supposed to be that of the Blessed Virgin, which by its application and the reciting of the Rosary cures many bed sores." In the county Galway is another stone of this description. Following this, in the parish of Kilbecanty and townland of Carragh is a heap of stones under a large whitethorn tree. On top of the heap is a rude stone cross, and in front of that an oval stone with a hole in the centre. The old people around have a great reverence for this stone, on which they tell you St. Patrick left the impress of his heel when in this part of the country. Until recently pilgrimages were made to this spot, and people suffering from headache touched the stone three times with their foreheads, while reciting the prayers for relief.

Evoc.

THE EUSTACE MONUMENT

IN THE RUINS OF NEW ABBEY. KILDARE.

From the "Anthologia Hibernica," April, 1794.

THE EUSTACE MONUMENT.

A RELIC OF THE PORTLESTERS.

In connection with the drawing of Lord Portlester's Chapel, St. Audeon's Church, Dublin, in our last issue, we give some notes on the history of the Eustace family. The following article on an interesting monument belonging to them in the New Abbey, Kildare, with the picture, which we also reproduce, appeared in the "Anthologia Hibernica," April, 1794:—

This monument was in the ruins of New Abbey, near Kilcullen, in the County of Kildare, till the year 1786, when it was destroyed with the greater part of the ruins, in order to build a Roman Catholic chapel with the stones. But the drawing with which this is accompanied was taken in 1784.

On the tomb, in alto relievo, is the effigies of Sir Roland Eustace, baron of Portlester, and his lady, Margaret Jenico. Sir Roland, who was founder of New Abbey, in the year 1460, is clothed in armour, according to the custom of the times. Lady Eustace is in the fashionable English dress of her age. On her head she wears the cap called a cornet, bound by a fillet or frontlet of gold or silver lace, wrought with the needle in no inelegant pattern. This fillet is tied behind, from which depend long lappets, or rather a kind of veil, which occasionally could be drawn over. On her bosom is a cross of pearls. Her gown is of that species called a kertle, made to sit close, with robings, and as pins were not then in use, made fast by a girdle studded with pearl roses. The skirts are plaited in large and thick folds, and trimmed at the bottom with a flounce. Her shoes are neat, and in the present fashion.

Here observe that the kertle was an English, not an Irish habit, nor did the original Irish ever wear it, though the English settlers constantly did. The Irish ladies wore the gunna, or gown, which was a long, loose robe without sleeves, as represented on O'Connor's monument given in Anth. Hib. vol. i., page 245, and frequently closed by a girdle.

Round the figures, on the outer edge of the tomb, was engraven in relief, in that species of gothic characters called church text, the following inscription:—

"Orate pro anima Rolandi Fitz Eustace de Portlestor qui hoc mo: construxit et fundavit, et qui ob: die Decemb. 19, A.D. 1496, etiam pro anima Margaretæ uxoris suæ."

The time of the decease of the lady is not expressed, as this part of the inscription is much defaced.

On the front of the sarcophagus are three figures in bas relief; that in the middle represents a keener, clothed in the Irish habit; on her forehead she wears the cabhin or keveen, and on her neck and shoulders the shawl or cladhach; her petticoat is also flounced; but she has neither a bodice or kertle; over all, even her head, she wears the Irish fallang or mantle, called also the bratlin or Connaught cloak. The other figures represent two heralds, in the crown, sword, tunic, and cloak of their office; and also on their heads, under the crowns, the long veil or coif, usually worn at funerals. There were some other figures on the opposite side, most of which were defaced, except that of a monk in the habit of his order, at the end. The sacrilegious hands which destroyed this monument were not content with removing the stones which composed it, but also scattered the bones of the founders in various places; sic transit gloria mundi.

THE GRAVE OF MacCAURA.

By Mrs. Downing (nee MacCarthy), born 1815, died 1881.

(The grave of MacCaura is believed to be that of Daniel MacCarthy, at Callan, on the road from Glancrought to Bantry, Co. Cork. This grave is a simple flat stone in memory of this chieftain of the M'Carthys, who fell in a conflict with the Geraldines in 1261, when the latter were defeated with heavy loss).

"And this is thy grave, Mac-Caura,
Here by the pathway lone,
Where the thorn-blossoms are bending
Over the mouldered stone.
Alas! for the sons of glory;
Oh! thou of the darkened brow,
And the eagle plume, and the belted clans,
Is it here thou art sleeping now?

"Oh! wild is the spot, MacCaura,
In which they have laid thee, low—
The field where thy people triumphed
Over a slaughtered foe;
And loud was the banshee's wailing,
And deep was the clansmen's sorrow,
When with bloody hands and burning tears,
They buried thee here, MacCaura,

"And now thy dwelling is lowly—
King of the rushing horde;
And now thy battles are over,
Chief of the shining sword.
And the rolling thunder echoes
O'er torrent and mountain free;
But alas, and alas, MacCaura,
It will not awaken thee.

"Farewell to thy grave, MacCaura,
Where the slanting sunbeams shine,
And the briar and waving fern,
Over thy slumbers twine.
Thou, whose gathering summons
Could waken the sleeping glen,
MacCaura, alas for thee and thine,
'Twill never be heard again."

DUBLIN BRIDGES.

By J. B.

Dublin, in whatever else it may be considered wanting, is by no means deficient in the number or size of its bridges. The River Liffey alone, from the Custom House to Islandbridge, a distance of less than three miles, is crossed in no fewer than ten places by bridges (not counting the railway bridges—viz., the Loop Line and the Great Southern and Western Railway bridge), and when it is taken into account that the distance between the Kingsbridge and Islandbridge is almost a mile it will be seen that the other bridges are very close to each other. It is to the Liffey bridge that the subject of the remarks in this article will be confined.

In very early ages Ireland was intersected by five great roads, all leading from the different parts of the country to Tara. At the place where one of the roads, the one coming from Wicklow, crossed the Liffey, a ford of hurdles was built, and around this ford a town sprung up, which was called Ath Cliath, which means "The ford of the hurdles." This was the ancient name of Dublin, and the ford then built was the first bridge across the Liffey. It is not known at what time the first stone bridge was erected, but it must have been before the Danish invasion. In sinking for the foundations of Whitworth Bridge in 1816 it was found that the foundations of the old bridge, which was erected in the reign of King John, rested on the ruins of a still more ancient bridge of stone. This shows that a stone bridge must have been built across the river at a very early date. Some people may doubt if the art of stone bridge building existed in Ireland at such a remote period, but we must remember that it is hardly probable that a nation which built round towers and churches at that period was ignorant of the art of stone bridge building.

The following is a short historical and descriptive account of the Liffey bridges, commencing at the first nearest the mouth of the river, Butt Bridge:—

Butt Bridge.—This bridge, which is commonly called the Swivel Bridge, was built in 1878, by the Port and Docks Board. It is built so that it can turn on a pivot in the centre of the river, and leave space on each side for ships to pass, but its utility in this direction has been destroyed since the erection of the Loop Line bridge, as no ships can pass under that bridge. At the time of the erection of Butt Bridge a great outcry was raised by some people, who said that it would destroy the view of the Custom House, but the Loop Line bridge already mentioned, built some years later, almost completely cuts off the view of the Custom House from the quays.

O'Connell or Carlisle Bridge.—Built in 1794, this bridge was formerly narrow, but since its rebuilding in 1880 it is one of the finest bridges in the United Kingdom. It rests on three arches, and is about 150 feet long; it enjoys the singular pecularity of being broader than it is long; it has a central pathway which divides the bridge into two roadways, and is crossed by no fewer than four tram tracks. From O'Connell Bridge one of the finest panoramic views of the city can be seen. To the North, Sackville street, with its large buildings and beautiful monuments, conspicuous among the former being the Post Office and the Rotunda, and the more prominent among the latter are O'Connell's and Nelson's. To the East the Custom House and the Harbour. To the South, Westmoreland street, Trinity College, and the Bank of Ireland; and to the West, the long line of quays extending away towards the Park, with the two towers of Christ Church in the distance, rising far above all other buildings.

Wellington Bridge.—Very few people will recognise the metal bridge by this name, yet this is its correct title. It was erected in 1816, and consists of one eliptic arch of cast iron, 140 feet in length, and for several years was considered a great piece of engineering skill. It cost about £3,000, and is used by foot passengers only, on payment of a toll of one halfpenny. It is a somewhat elegant structure, but its appearance is greatly marred by unsightly advertisements.

Grattan or Essex Bridge.—This bridge was originally built in 1678, at a cost of £20,600, and called Essex Bridge, after the Lord Lieutenant of that name. It was re-built in 1755 on a model of Westminster Bridge. In 1874 the tops of the arches were lowered and the bridge made level, and, in addition, was widened by having the footpaths supported by iron wings projecting from the sides of the arches. The total width of the present bridge is 75 feet, or 25 feet broader than the old one. The length is over 200 feet, which is 50 feet longer than O'Connell Bridge. After its rebuilding, in 1874, it was called Grattan Bridge by the Corporation. On this bridge was erected, in 1720, the equestrian statue of George I., which at present is situated in a plot of ground near the Mansion House. It was removed at the rebuilding of the bridge in 1753, and never restored.

Richmond Bridge.—This bridge was opened for traffic in March, 1816. The foundation-stone was laid by Charlotte, Duchess of Richmond, hence the name. It was erected by the Dublin firm of G. Knowles, at a cost of £25,000. It rests on three arches, the keystones of which are ornamented by large heads representing on one side, Peace, Hibernia, and Commerce, and on the other Plenty, the River Liffey, and Industry.

Whitworth Bridge.—This bridge occupies the site of what was undoubtedly the first stone bridge built across the Liffey. In 1214 King John granted permission to the people of Dublin to pull down the old bridge, which was in a dangerous state, and build a new one. In 1385 the bridge collapsed, and was replaced by another, built by the Dominican Friars, in 1428, for the convenience of their students at their school at Usher's Island. It is not known at what time this bridge was replaced. In 1307, we learn that shops were built on the old bridge, and in 1310 King Edward II. sanctioned the erection of a fortified tower on it. In 1573 a public clock was put up on the bridge, and in 1697 lamps were first put up on it for the proper lighting of the river. Near the bridge stood the house of the famous Ussher family, one of whom, John Ussher, published, in 1571, the first book in the Irish language. For many years this bridge was the only means of communication between the city and its suburbs. The present bridge was built in 1816, during the Viceroyalty of Lord Whitworth, and, according to a custom which then prevailed, was called after him.

Queen's Bridge.—Built in 1764, this bridge succeeded Aran Bridge, which was carried away by a flood in 1763. It rests on three arches of hewn stone; the centre one has a span of 45 feet, and each of the others 35 feet. The piers are 7 feet in thickness. The total length of the bridge is about 130 feet.

Victoria Bridge.—At this site in 1670 a wooden bridge was erected which, according to ancient records, was the second bridge built over the Liffey. In the same year some apprentices attempted to destroy it, so as to cut off the military barracks on the opposite side of the river. This led to a fight with the military, who captured some of the offenders, but, on recrossing the bridge with their prisoners, they were attacked by a crowd which had collected, and in the fight which ensued several people were killed. This affray led to the bridge being called "Bloody Bridge"—a name by which it is known to the majority of people to the present day. The wooden structure of 1670 was replaced by a stone bridge, this in turn was replaced by the present handsome structure which consists of one span of iron of about 100 feet, resting on granite abutments.

Kingsbridge.—An ornamental iron bridge of one span of 100 feet, resting on granite supports, was erected in 1827 to commemorate the visit of George IV. to Ireland. It cost about £13,000, which was raised by public subscription.

Sarah Bridge.—Commonly called Islandbridge was named after Sarah Countess of Westmoreland, who laid the foundation stone in 1791. It consists of one graceful arch of 104 feet. It has been called the Irish Rialto on account of its elegant proportions, and is said to be seven feet longer than the famous Venetian Bridge. It connects Kilmainham with the approaches to the Park.

It will be seen from the above accounts that all the present Liffey bridges are quite modern, all, except one, having been built or rebuilt within the last one hundred years. The bridges present a very fine appearance from the quays, a spectator being particularly struck with the neatness of the design of the iron bridges, and the imposing width of O'Connell Bridge. Although it must be confessed that when the tide is out the view of the bed of the river by no means adds to their beauty. However, it is to be hoped that when the main drainage scheme is some time in operation, the general aspect of the sides and bottom of the Liffey will be considerably improved.

TO LEARN LANGUAGES.

A NEW WAY ADVANCED TO MASTER THEM IN A SHORT TIME.

"It doesn't require any great length of time to learn a language if one has patience," said a man who has mastered several languages, "and when I hear a man regret that he is not able to speak French, or German, or Spanish, or some other language unknown to him I cannot conceal my amusement. In nine cases out of ten I might say that the men who express a regret of this sort handle English very poorly if that happens to be their language. The chances are that their vocabularies are extremely limited, and it would probably surprise them to know that, despite the advantages of birth and education, they could not command more than 600 or 700 words in English if their lives depended upon it. Yet they are able to carry on intelligent conversation, and many of them may become forcible and even axiomatic in their sayings, and they plunge into discussions of literature, art, music, and other subjects of such fine elegance, and do it rather successfully, too. Now how long ought it take for a man to learn 600 or 700, or even 1,000 words, in any language? Certainly, it ought not to take any great length of time, and from my own experience I know that it does not. Of course I am not speaking now of mastering so that one can get the full benefit of all the refinements of speech in a particular tongue. But I have in mind the idea of speaking intelligibly in a given language and being able to understand perfectly what is said in return. I have a system which I have worked out, and it has been of vast benefit to me, and has enabled me to learn a number of languages. It occurred to me while I was in Mexico a few years ago on important business. I could not speak a word of Spanish, and I could not understand the language. I concluded that I would learn the language. My plan was simply this: I made up my mind that I would not retire at the close of any day as long as I was there without learning at least three words in Spanish, how to pronounce them and what they meant. That would give me ninety words per month, or something over 1,000 in a year's time. I stuck to the task, and I was there nine months, and as a result of my system I was not only able to converse in Spanish, but carried on my correspondence in Spanish. I don't suppose I could write an essay in the language, but I can speak it, write it, and understand it, and it was all brought about by the three words a day system."

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

By CHARLES SMITH, M.D.

Chapter V.

A Description of the Barony of Bear and Bantry.

Bear and Bantry compose but one barony (1); it is very large, but barren and desolate, there being but two or three resident clergy in the whole barony; but what it wants in the goodness of the land is amply made up by the noblest bays in the world, that of Bantry being capable of containing all the shipping in Europe. This bay is also called Bear-haven, and has given title of viscount to the family of Berkley, who were Viscounts Fitz-Harding, of Bear-haven. It at present gives title of viscount to the Right Hon. Walter Chetwynd, created Viscount Chetwynd, of Bear-haven, and Baron of Rathdown, in the County of Wicklow, anno 1717, the 3rd of George I.

The town of Bantry is seated at the bottom of this extensive bay on the E. side. It was formerly called Ballygobbin as also the Old town to distinguish it from another settlement, called the New Town, where Ireton had a fortification erected, with four regular bastions, which caused the inhabitants to build near it, but when this fort went to decay, they returned, by degrees, to the Old Town, called Bantry, from its being the chief settlement of this half barony. A few years ago, when the pilchards (2) frequented this bay, it was a very thriving town; but for want of employment, is again fallen into decay. Near it stood a Franciscan abbey, founded anno 1460 by Dermot O'Sullivan, now entirely demolished. In many creeks round this bay are several fish palaces, as they are called, built for saving, preserving, and salting of pilchards of which commodity several thousand pounds worth have been sent from hence to Spain, Portugal, and Italy; but of late years there has not a single pilchard appeared on the coast. The Sullivans had formerly several good seats round this bay; that of Rinedizart was demolished by a ship of war, in Oliver Cromwell's time. They had another at Black-rock, where there is a good house of Samuel Hutchinson, Esq. Three rivers fall into this bay from the N., viz., Moyallah river, being the most easterly, next to Bantry, which empties itself down a steep rock into the bay; neither salmon nor trout can go up into it, so that it is quite destitute of either; the Ouvane, i.e., the middle river; and the western river, called Curloom. In the town of Bantry is a barrack for a foot company, and a decent parish church; it formerly gave title of Baron to Roper, Viscount Baltinglass. The bay of Bantry is 26 miles long, and, in most places, above a league broad; in the midst of it are 40 fathom water. There are few strands round it, the coasts being all high, stupendous rocks. The entrance of this bay is formed by the mountains of Bear-haven to the N.W., and Sheep's-head point to the S.E. On the larboard hand lies the island of Bear-haven; all the W. side is one continued chain of lofty mountains, running far up the country to the N., and dividing the counties of Cork and Kerry; they were anciently called Vallis Juncosa, and were the retreat of the ancient Irish, soon after the arrival of the English, from whence they scarce stirred till the divisions of the houses of York and Lancaster obliged many of the latter to quit the country; upon which the Irish came once more into the lower grounds, to the great annoyance of the remaining English. The island of Whiddy, anciently Fucida Insula, lies opposite to the town of Bantry; it is a pleasant spot, of a triangular form, and the soil is excellent. In it Richard White, Esq., whose property it is, has a deer park, where are both a fresh and salt water lake, at no great distance from each other. The deer are very fat, and this island produces as large mutton as any in the county of Limerick, where the largest in Ireland is said to be; it is not unpleasant to see the small Bantry mutton, which is exceeding fat and good in its kind, compared to this of Whiddy island, and bears no proportion to it as to bigness. In this island are good orchards, and also a profitable hop-yard; it abounds with hares, as the owner suffers none to be killed. Near Whiddy island are some small ones, viz., Horse-island, Hog-island, Chapel-island, and Coney-island; and all these fatten lean horses, in the spring season, to admiration.

From Bantry to Bearhaven, by land, there is nothing remarkable, except the iron furnaces at Comolin, which have been in a thriving condition for some years past; but wood begins to grow very scarce. In the bay of Glengariff, and towards the N.W. part of Bantry bay, they dredge up large quantities of a coral sand, found to be a most excellent manure, and lasts in the ground above 20 years. At Ross Mac-Owen, midway between Bear-haven and Bantry, lives Mr. Murtough O'Sullivan, a person well known in those parts; he and his elder brother, who is commonly called Mac-Fineen Duff, who lives near the river of Kinmair, are the chief remains of the O'Sullivan family in this country. There is in Spain a descendant of O'Sullivan Bear, who is ennobled, and called there Count of Bear-haven; and is also said to be hereditary governor of the Groyne.

Not far from Ross Mac-Owen is one of the largest and highest waterfalls in this kingdom. This cataract is very visible from the town of Bantry, at least 14 miles distant from it. The water is collected from various small rivulets and springs, forming a large lake, on the top of a vast, high, rocky, and almost perpendicular mountain, called Hungry-hill, which is at least 700 yards above the level of the bay of Bantry. The water cascades from the top of this mountain in a beautiful sheet, at least ten yards broad, which expands as it falls; about half the height of the mountain it dashes perpendicular on a prominent rock, from whence a mist arises almost a third part of the hill, which, in some particular stations, the sun's rays playing on it, and meeting with the eye of a spectator, must make a charming appearance; these kind of mists, in such positions, generally reflecting the colours of the Iris; hence it falls, from rock to rock, till it has passed the rugged declivity of Hungry-hill; and before it gains the ocean, it has another fall, cascading, in an arch, over a lower hill; all which make a fine sight as one sails up and down the bay. But those who are curious will not murmur at the labour they may have in visiting every part of this noble cataract; nor will, I hope, the poetical reader at the following description of one, from Mr. Thomson, which very literally agrees with ours:

Thus up the mount, in visionary muse,
I stray, regardless whither; till the stun
Of a near fall of water ev'ry sense
Wakes from the charms of thought: Swift shrinking back,
I stand aghast, and view the broken scene.
Smooth to the shaggy brink, a spreading flood
Rolls fair and placid, till collected all,
In one bright glut, as sinks the shelving ground,
Th' impetuous torrent tumbling down the steep,
Thunders and shakes th' astonish'd country round.
Now a blue wat'ry sheet; anon disper'd,
A hoary mist, then gathered in again,
A darted stream along the hollow rock
This way and that tormented, dashing thick
From steep to steep with wild infracted course
And restless roaring to the humble vale.
With the rough prospect tired, I turn my gaze
Where in long vista, the soft murmuring main
Darts a green lustre.

Thomson's Seasons.

Castle-town, alias Castle-dermot, is a small village, of little note, opposite to the island of Bear-haven, which is about six miles long, is very coarse, mountain-

(1) In this barony are the parishes of Kilmacomoge, Kilcaskin, Killaghaninagh, Kilkaterin, Kilmanagh, and Durrus; it contains 195 plowlands, and 84,132 acres, of which 15,911 are very justly esteemed unprofitable.

(2) On the 3rd June, 1749, Mr. Richard Mead, of this town, to entitle him to a præmium given by the Rev. Doctor Madden, fully proved to the Dublin Society that he had, within the year, catched and cured 380,800 fish of different kinds, six score to the hundred; a prodigious taking for one man! And that this was no casual thing, is evident from Mr. James Young of the same place, his having catched and cured 482,500 herrings, and 231 barrels of sprats the preceding year. If private adventurers, with small funds, are able to do so much, what may we not reasonably expect, if a sufficient stock was raised to establish a general fishery on our coasts?

ous, and rugged, yet is of great use in defending this noble bay from the fury of the S.W. winds; so as vessels within the island may ride secure, according to those lines of the poet:

Nec tamen hoc arctis immissum faucibus æquor
Portus erat, si non volentos insula coros
Exciperet saxis, laxasq; refunderet undas.
Hinc illinc montes, Scopulosæ rupis aperto
Opposuit natura mari flatusq; removit,
Ut tremulo starent contentæ fune carinæ.
Lucan, lib. II.

Nor yet the bending shores cou'd form a bay,
Did not a barrier isle the winds delay,
And break the seas tempestuous in their way.
Huge mounds of rocks are plac'd by nature's hand,
To guard around the hospitable strand,
To turn the storm, repulse the rushing tide,
And bid the anch'ring barque securely ride.
Rowe.

S.E. from Castle-dermot stood the celebrated castle of Dunboy, which, in the year 1602, was taken by Sir George Carew, after a most obstinate and vigorous defence. Crossing a rude, uncultivated country to the W., the river of Kinmare, as it is called, though really a large bay of the ocean, appears. The E. side of the mouth of this river is in this county; and farther up, both sides belong to that of Kerry.

From hence one has a prospect of the Durseys, anciently called Bea Insula. This island is very strong by nature, because of the difficulty of landing, which is convenient but by one narrow entrance, that might be defended by a few hands, and was formerly fortified with a castle, by some mistaken for the ruins of an abbey; besides, it is impossible to arrive at this spot but in a dead calm, the least gale of wind raising such billows, as it is very dangerous for any boat to come near the shore. This seemingly impregnable place was chosen by the Irish, after the defeat of the Spaniards, for their last refuge, if Dunboy should be taken by the English. They committed the custody of it to Connor O'Driscol, son and heir to Sir Fineen O'Driscol, who procured three pieces of Spanish ordnance to be conveyed into this island, with stores, ammunition, and 60 men, which fortified it, as they imagined, against the most potent enemy; but they were soon obliged to surrender it to Captain Rostock who demolished the forts, and brought off the garrison prisoners to the camp at Dunboy, where they were all executed. This island is exceedingly rough and coarse, and is about three Irish miles long.

From the S. part of Bantry bay to the N., there are but two passages by which one can go into Kerry; that on the N. end is a most rugged, dangerous one, called the Priest's-leap, and well known in this country, from whence the road leads over the mountain of Mangerton, justly esteemed one of the highest in Ireland. Among these wild tracts are, here and there, some yew trees remaining, of a very large size; they were formerly in greater plenty, as was also the arbutus or strawberry tree, which is celebrated to flourish in such soils.

Surgit and in solis formosior arbutus antris.
Propertius, lib. I.
Arbutus fairest in wild tracts arise.

There are plenty of red deer in this country; but they are, of late, become exceeding rare.

The castle of Cariganass, which belonged to the O'Sullivans, is built on the river Ouvane, four miles from Bantry. It was an high structure, with a square court, and flanked with four round towers. In it Daniel O'Sullivan, surnamed Caumb, i.e., crooked, kept garrison in Queen Elizabeth's time. But upon Tirrel's flying the country, after the conquest of Dunboy,, this castle, and that of Ardea, were surrendered to the Queen's forces. Near this is a fine oak wood still growing; one Dennis Hurley, aged 96, who died about thirty years since, remembered the cutting down of this wood three different times, and at each cutting the trees were fit for beams, boat-timber, and most other uses. Richard White, Esq., of Bantry, whose land it is, had some time ago occasion to dig out a large piece of oak sunk in a morass, and found the soil about it, for seven feet perpendicular, to be a fat, grazy clay, of the colour of rotten cheese, free from grit, and dissolving readily in the air; the soil produces a very large quantity of rank, swarthy grass. This wood is situated between two mountain rivers, which bring down great quantities of earth and mud that, with the spray and leaves of the trees, compose this kind of soil. This earth, upon trial, did not ferment with acids; but it might probably be an excellent manure for coarse, gravelly grounds.

In returning from Bantry to Carbery, the road is extremely rocky; three miles E. of Bantry there is a valley, called Murdering-glin; in it are a vast quantity of large stones and rocks, thrown together in the same sportive confusion as if they were shot out of the mouth of a prodigious large volcano; and the adjacent hill on the top being hollow, with a rugged, stony edge around it, looks not unlike the mouth of one. About the town of Bantry, on the adjacent hills, are some well-cultivated grounds; and I have seen a meadow belonging to Richard White, Esq., which he reclaimed from a bog, that afforded near double as much hay as I ever saw mowed off the same quantity of land; where the ditches were made to enclose this field, there was a white, coarse clay thrown up, that lay at the bottom of the turfy soil; and where this clay was laid, the grass grew very luxurious, which seems to be no bad hint for the improvement of such drained lands. This clay adds a firmness and solidity to the bog; and yet would probably hurt any other kind of soil, as it is in its own nature cold and impoverishing.

Having described all the baronies S. of the Blackwater, I proceed now, to describe those on the N. of that river.

(To be Continued.)

FORESTRY IN IRELAND.

In a recent issue of "Woods and Forests," Lord Powerscourt gives an interesting description of extensive planting which he has carried out in the Co. Wicklow.

The first plantation which I undertook, he says, was on a mountain opposite Powerscourt, at an elevation of from 700 to 900 feet above the sea, where I enclosed with dry stone walls some 350 acres, in addition to an old plantation, and planted it principally with larch and Scotch fir. The wood was planted about the year 1861 or 1862, and I have been for some years cutting poles out of it of very good growth, and it is now ready for a thinning which will produce prop wood and very shortly even telegraph poles.

I then took in about 200 acres or so of another mountain, and planted it with the same description of trees, with a few oaks interspersed, but this wood has had the misfortune to be burnt twice from careless people throwing lighted matches into the furze with which parts of it were covered, and which had grown up near the roads after having been cut at he time the planting was done. The wood will, therefore, have in great part to be replanted. The success, however, of the unburnt part of this, as well as of the first plantation, induced me to undertake a similar operation on a larger scale, and the method was the same in each case. I employed a small gang of some seven or eight men to build dry walls of about six feet in height, with the stones so plentiful on the ground, round the sites of the intended plantations, that height including a rough, or, as it is called, a Scotch coping, the outer face of the walls being built perpendicular or with a slight batter inwards at the top, and to a certain extent smooth, the coping projecting outwards some six or ten inches to prevent mountain sheep jumping over it, the inside being left quite rough.

In these plantations there was scarcely any drainage to do than merely deepening and straightening a few small mountain streams so as to prevent the water spreading over the ground and soddening it. This large plantation is at an elevation of some 500 feet at the bottom to 900 feet at the top, above the sea. In the walls, both at top and bottom, were made openings, fitted with iron gratings slung at the top and left loose at the bottom, to prevent stones or gravel brought down by floods from stopping up the water ways. The cost of the wall was 11s. per perch of 7 yards, and there are about 1,266 perches of it. I am not very sure as to the extent enclosed, as it has not been surveyed, but I think I am rather under than over the mark in stating it at about 700 Irish acres.

In some parts of the large plantation here, which I call Ballyreagh Wood, from the name of the townland in which most of it is situate, although it extends partly into another townland, the trees were pitted, as I had such a large quantity of trees in the nursery that there was not time sometimes to plant them all out in one season, and some of those which remained over from the season before had grown too large for notching. For the first two or three years the pitted plants appeared

to have the advantage, as they looked larger than the notched ones, but now, in 1833, it would be impossible to tell the difference. The cost of pitting was about one shilling per 100 holes. There was a remarkable difference to be seen also in the trees which had been planted in ground which had formerly been cultivated, from those planted in virgin soil, which had always been pastured by sheep. In the space now occupied by the wood were several small plots which had formerly been potato gardens belonging to cottier tenants who had emigrated in the famine years of 1847 and 1848. The whole hillside was planted at once, including these small plots, and at a distance one could easily see at first where the cultivated land had formerly been, as the trees throve much better on the virgin soil, and looked a much lighter colour, and less healthy on the tilled portions, owing to the exhausted nature of the soil. The trees, however, very soon cured that themselves, by the yearly deposit of their fallen leaves, and now no one could see the difference. The plants were supposed to be put in about 4 feet apart, but, taken as a whole, they were rather under than over that, and about 4,000 per Irish acre may be taken as an average.

On the higher parts the growth has not, of course, been so rapid as below, but still it is fairly satisfactory. On the portion which has been twice thinned the trees stand now at an average distance of 8ft. apart—say, 1,000 trees per Irish acre—and if we value them at 3d. each we have £12 10s. per acre at the present market value. I do not think this is too high, taking the average girth of the larch at ten inches at 6ft. from the ground. For the first ten years it may be prudent to assume that no return whatever will be derived from the plantation; the thinnings up to this time do not more than cover the expense of cutting and the interest on the first crop. But after a lapse of, say, twenty-five years from the time of planting, it is a moderate estimate that, for thirty to forty years, an annual return of 8s. per acre may be obtained, and at the age of forty to forty-five years the crop left standing cannot be worth less than £50 per acre.

No doubt many causes may supervene to affect the value of the plantations, such as variety of soil and situation, and the demand for timber at the time it is cut; but if anything like the present rate of growth is maintained for the next twenty years the estimate stated above of the value of the standing crop will not be too high. On some of the higher parts, the rate of growth being slower, the value will therefore be proportionately less, but it may be questioned whether the shelter afforded to each other by the trees when they get up will not bring them forward nearly as fast as those on the lower level. The average growth of the larch at the first planted parts was little short of thirty inches last year, and there seems no reason why this rate should not continue.

COMETS OF THE NEW YEAR.

Eight periodic comets are due to pay a visit to the sun in 1903. In fact, the perihelion date of one, the Tempel-Swift comet, fell in December, 1902, and that of another, D'Arrest's, comes in January, 1904. Seven of them made their last previous visit in 1900, and one in 1901. But not all were seen then, and it is not expected that all will be visible this time. Some will be hidden behind the sun, and some are supposed to have gone slightly astray under the influence of Jupiter. Their names and perihelion dates are: Perrine, May 5, 1903; Giacobini, May 15, 1903; Spitaler, August 16, 1903; Faye, October 15, 1903; Brooks, December 12, 1903; D'Arrest, January 15, 1904.

AN IRISH HEROINE IN HUMBLE LIFE.

Some years ago, in, we believe, 1896, a will suit was tried by Judge Adams at Limerick in which the matter in dispute was the will of an old woman named Catherine Gavin, who died some time previously at Bruff, in the county Limerick. It does not appear to have been mentioned at the trial that this poor woman was a heroine whose story forms part of the record of that great tragedy, the American Civil War. Her story is told in General Baker's "Secret History of the War," and in other accounts of the great struggle. At the breaking out of the war Mrs. Gavin was a poor widow at Troy, New York State, and supporting her family by her industry. She had a son, Con. Gavin, an idiot, who was sent to the asylum at Albany, and there kindly treated. When a lad in his late teens the supply of men in the Northern Army ran very short, and a bounty of 200 dollars was offered for each recruit. All kinds of frauds were practised by the ruffians called bounty-jumpers. some of those scoundrels carried off, with, is is to be feared, the aid of one of the asylum staff, Gavin and other idiot lads, enlisted them in the Northern Army, and pocketed the bounty. Con Gavin was at once sent to the front; and from that time forward no certain trace of him could ever be discovered. The poor mother, on hearing the news, became nearly frantic, and, leaving her work, managed to get to Washington. There she succeeded in obtaining an interview with President Lincoln, a most kind-hearted man, who gave her letters to some distinguished officers, and then she set out on her great search for "poor Con." It lasted for two years—that is to say, up to the end of the war. On two occasions there was an intermission of some months caused by her resources failing. When this happened she went back to Troy, worked hard at daily manual labour, lived on bread and water, and thus saved enough to renew the search. In pursuit of her quest Mrs. Gavin visited every camp of the army from the Mississipi to the Atlantic, inspected every regiment in the service, and searched every military hospital in the country. She soon became known to the soldiers far and wide. There was little resemblance between this poor Irish washerwoman and Longfellow's famous Acadian heroine—"Fair was she to behold, that maiden of seventeen summers." And yet both quests sprang from the same source—love—and Mrs. Gavin's search after her son was as thorough as that of Evangeline after Gabriel.

"In seasons and places,
Divers and distant far was seen the wandering maiden,
Now in the tents of grace of the meek Moravian missions;
Now in the noisy camps and the battlefields of the army,
Now in secluded hamlets, in towns, and populous cities."

Many a night and day were spent by Mrs. Gavin in bivouac and battlefield, and she witnessed some of the principal engagements of the great war. Her story passed from the Northern to the Southern lines, and she was permitted to enter the entrenchments of the Confederacy, and to search some of its hospitals and prisons. When for a moment she rested by some camp fire she would spring up and exclaim, "But I must go and look for poor Con!" and she started forth on her weary round, now passing from bed to bed in a hospital, now scrutinising with keen eye the soldiers of a regiment, now turning over the corpses of the brave as they lay on the battlefield. At one time Mrs. Gavin believed that she had found her son, and an officer was actually put under arrest for concealing traces of his identity. This seems to have ended in nothing; the war-cloud over the fate of Con Gavin was never cleared up. When, many years after the war, the Pension Act was passed by Congress, Mrs. Gavin, as the mother of the soldier who had presumably died in the war, was awarded a pension of £40 a year and arrears thereof for several years. It was the arrears which were litigated about in the will-suit already mentioned. The will was broken, as the poor woman's mind had failed in recent years, but she had not forgotten the famous object of her long search. She had left money "for Masses for the soul of my dear son, Con."

LINKS WITH THE PAST.

On page 12 of "Reminiscences of a Long Life," by the late Rev. Dr. Killen (London: Hodder, 1901), occurs the following notable passage, which illustrates how Irish longevity connects so closely the present time with the now remote seventeenth century:—"Of the senior members of the family, my grand-uncle, James Miller, alone remained. He died early in 1829 in the ninetieth year of his age. He retained his faculties to the last. He was born in 1739—famous as the year of the Black Frost—and could tell what he had often heard of the awful severity of that visitation and of the dearth which followed. He had also traditions of the fifty or sixty years preceding. He had once, in his youth, met with a very aged man, who, as he informed him, passed through "the wars of Ireland," including the conflicts towards the close of the reign of James II., and the Battle of the Boyne. Thus it would appear there is only one link—that is my grand-uncle's—in the chain of tradition connecting me with those who were moving about in the days of William III." A more striking instance, perhaps, of this same sort of living links with the past is that narrated in a foot-note to page 258 of the Rev. A. Coleman's excellent edition of Stuart's "Armagh" (Dundalk: William Tempest)—a work interesting alike to all classes of Irishmen, and now to be had at a considerably reduced price:—"In the year 1784 a very old man and a woman still older met accidentally in the shop of Mr. Robert Cochran, Market street, Armagh. The man, who was a beggar, had accompanied King James in his visit to Armagh, and had afterwards fought at the Battle of the Boyne. The woman, who resided near Hamilton's Bawn, was the widow of a soldier who had carried arms under King William. They quarrelled and scolded each other vehemently about the politics of the previous century. They both, however, coincided with the ancient tradition relative to the houses in which King James had lodged in Armagh. The author of this work (James Stuart) and Mr. Cochrane's family were present at their meeting. The woman lived to the age of 140, her daughter to that of 122." James Stuart, who wrote this note in the original edition of his History of Armagh, first published at Newry in 1819, died September 28th, 1840, and was interred in the Antrim Road Cemetery, Belfast. More remarkable still is the case of this sort recorded in his "Memories of Youghal," by Canon Hayman, who died in 1886. A Youghal doctor still in practice when Hayman wrote his "Memorials," attended professionally a weaver named Kennedy, who died in Windmill lane in 1823, aged 114 years. Kennedy informed this doctor that he had served his apprenticeship to a weaver named Fox, who carried on his business in the North Main street, near the Clockgate, Youghal. Fox, when a boy, stole away from his work in order that he might follow the great funeral from Dungarvan (that of General Jones); and he listened to Cromwell's address over the rmains St. Mary's Abbey Church, Youghal. Fox remembered quite well the appearance of Cromwell in the street, with his slouched hat and military cloak; and he saw him on the 26th of May, 1650, ass with a cavalcade, under the Watergate, embark at the landing-stairs near the Old Fort, and get on board a large frigate, "The President," bound for England."

To the above may be added another example of Irish longevity in the person of Samuel Shields, who died at Molenan, near Londonderry, on Monday, February 15th, 1892, aged 108. Samuel Shields, who was born in the adjoining district of Balloughry, and was a weaver by trade, had a vivid recollection of the incidents of the Rebellion of 1798, and being an eye-witness to the event, often described with great clearness the removal of Napper Tandy and the French prisoners to Lifford Jail, after capture in the "La Hoche," off Lough Swilly. Shields and others walked to Lifford to see the prisoners.—J. C.

LITERARY NOTES.

Mr. Kitton has collected together for the first time, for issue by Chapman and Hall, all Charles Dicken's poems, occasional verses, and songs. The collection will include not only the lyrics from Dicken's operettas, "The Village Coquettes" and "The Lamplighter," but also his political squibs and songs in the "Examiner," "Daily News," and elsewhere. Bibliographical notes supply the circumstances of production, with some anecdotal particulars.

✧ ✧ ✧

Messrs. Isbister and Co., London, will issue, on St. Patrick's Day, Seumus MacManus' first novel, "A Lad of the O'Friel's." It is a story of Donegal life in the forties, and contains descriptions of scenery and character in which the writer is apt. The book is also published by Messrs. M'Clue, Phillips, and Co., New York. Mr. MacManus has at present "on the stocks" another novel dealing with the days of the Molly Maguires.

✧ ✧ ✧

Messrs. Methuen are publishing the Four Folios of Shakespeare reproduced by photography from perfect copies. Though reprints from the First Folio by facsimile or otherwise have been from time to time published, no reprints of the Second, Third, or Fourth Folios have hitherto being produced. A fine set of the Four Folios cannot now be bought for less than £2,500, and even for a poor set £1,000 would be a low price. A thousand copies of each Folio will be printed on pure linen-paper, and the price of each will be three guineas net. The binding will be paper boards, but the books may also be had bound in full calf in the contemporary style for an additional sum per volume. This is a spirited enterprise, and ought to prove successful.

✧ ✧ ✧

The "Literary Year Book" for 1903 leads off with a portrait of M. Maurice Maeterlinck; then follows a survey of the "Year's Work, 1902," by Mr. Herbert Morrah. Mr. Morrah is optimistic on the whole; he thinks that literature is flourishing, and that in the dramatic world there are "signs of abundant life." The "Year Book" continues to increase in bulk; authors join the literary ranks with airy cheerfulness, and if they repent they repent in secret. This year the directory of authors runs to one hundred and sixty pages, and that of publishers, including a useful foreign section, to forty pages. On the civil list there are no fewer than one hundred and seven more or less literary pensioners, the annual grants ranging between £25 and £250.

✧ ✧ ✧

The latest Literary Examination Paper set by "Good Words" has "David Copperfield" for subject. Here is the first question:—

1. Explain with reference to the context:—
   i. "That's a settler for our military friend."
   ii. "My foot will be upon my native heath."
   iii. "Touch the Commons and down comes the country."
   iv. "You are playing Booty with my clerk."
   v. "What I wish is that parties was brought up stronger minded."

There follow six more questions, of which the last is: "Transcribe from the columns of the Middlebay 'Times' a valedictory letter (imaginary) to Lord Tennyson from the pen of Wilkins Micawber, Esquire, Junior." Competitions of this kind are very popular, we believe; but does the book selected for the examination paper ever give the competitors any further pleasure?

✧ ✧ ✧

Mr. Murray's instances of verb manufacture in the "Spectator" have drawn three letters on the subject. One of the "Spectator's" correspondents writes:—

In six out of the nine instances given by Mr. Murray the novelists or poets he condemns are suported by authority. The "Century Dictionary' gives "hoarse," "husk," "shrill," "tiptoe," "glimpse," "parrot," as verbs, with references to Shakespeare, Spenser, Richardson, etc. Mr. Murray must get used to bad calligraphy. I am convinced that his Guppy must have written, not "yells," but "wells of joy artesianed up his throat"; and if Guppy hath not "enriched our tongue," this effort is distinctly "good."

Then follows a communication from a lady concerning children's coinages:—

Only yesterday when my little girls were playing with a toy hospital, one of them said to the other: "This child seems to be suffering from 'cute neuralgia in the eyelashes; bettn't we give it a dose of cough lozenges?". Again, in speaking of two china dogs, she said: "'Castor' and 'Pollux' look languid this morning; bettn't they have a bath?" Her sister observed to me just now: "What a noise you did make tintacking with that hammer!" "Had not we better," or "they had better," sounds very awkward and cumbersome compared to the brief and convenient "bettn't."

Children, however, are privileged; it is, perhaps, fortunate that they do not write for publication.

✧ ✧ ✧

In the current number of "Longman's Magazine" we find some simple and beautiful verses by Mrs. Shorter, entitled "The Child." The child comes to turn hopelessness into gladness:—

"Will you not stay and teach us to be glad?"
The woman cried; "We then, indeed, were blessed."
"I am but little to go forth alone,"
The babe replied, and nestled to her breast.

And so he stayed for many years to play
Beside the hearth, and at each purple eve,
When came the man soft singing from his work,
All full of dreams he could but half believe.

The woman met him on their threshold; spoke
In solemn wonder, with a "Hush!" and "Hark!"
"To-day he drove out Sorrow from the door:
With his small hands he shut her in the dark."

Or, "Go you soft: he slumbers like a bird
That nests, half-singing in his pleasant sleep:
To-day from our hearth-side he thrust out Grief—
This wonder-child did laugh to see her weep."

Then the child becomes a man, goes out into the world, and returns with something of the world's knowledge, so that the mother who watches him sleeping sees that he is "dreaming of another face." The charm of the poem consists in its unaffected simplicity.

✧ ✧ ✧

The other night Mr. Pinero delivered in Edinburgh, to the members of the Philosophical Institution, a lecture on "Robert Louis Stevenson: the Dramatist." The plays discussed by Mr. Pinero were "Deacon Brodie," "Admiral Guinea," and "Beau Austin," and the question which the lecturer set himself to answer was this: "Why should Stevenson, the dramatist, take such a back seat . . . in comparison with Stevenson, the novelist, the essayist, the poet?" Part of the answer Mr. Pinero states thus:—

We shall find, I think, that Stevenson, with all his genius, failed to realise that the art of drama is not stationary, but progressive. By this I do not mean that it is always improving; what I do mean is that its conditions are always changing, and that every dramatist whose ambition it is to produce live plays is absolutely bound to study carefully, and I may even add respectfully—at any rate not contemptuously—the conditions that hold good for his own age and generation. This Stevenson did not—would not—do. We shall find, I think, that in all his plays he was deliberately imitating outworn models, and doing it, too, in a sportive, half-disdainful spirit, as who should say "The stage is a realm of absurdities—come, let us be cleverly absurd!"

The point (remarks the "Academy") is a good one, though with whatever intention Stevenson set out in the plays he became at times absolutely and convincingly serious. For Stevenson's essential dramatic talent Mr. Pinero has, naturally, the greatest respect. As example of that talent he quoted the extraordinary story which Stevenson sketched for us in the "Chapter on Dreams."

✧ ✧ ✧

Concerning "Beau Austin" and technique, Mr. Pinero said:—

I am not claiming any absolute and inherent superiority for our modern realistic technique, though I do not think it quite so inferior as some critics would have us to believe. But what I do say is that the dramatist is bound to select his particular form of technique, master, and stick to it. He must not jumble up two styles and jump from one to the other. This is what the their language is neither poetry nor prose—the authors of "Beau Austin" have not realised. Their technique is neither ancient nor modern; prose, that is to say, of conceivable human life. The period has nothing to do with it. People spoke, no doubt, a little more formally in 1820 than they do to-day; but neither then nor at any time was the business of life, even in its most passionate moments, conducted in pure oratory.

True enough, no doubt, but Mr. Pinero seems momentarily to have forgotten those conventions of the stage which would seem to make realistic dialogue impossible. If Mr. Pinero ever takes the trouble to read through his own dramas he must be aware that his characters talk as no people ever did talk. And after all, when Mr. Pinero has criticised Stevenson as a dramatist and made out a reasonably strong case, there remains the fact that although we enjoy Mr. Pinero's plays, we have enjoyed Stevenson's more when we have had the chance of seeing them. Two of the Stevenson-Henley plays, at any rate, are literature.

✧ ✧ ✧

The "Academy and Literature" recently offered a prize of one guinea for the best letter to the Editor on any current literary topic. Twenty-one replies were received, the following from Mr. M. J. Ebbutt, Lampeter, being awarded the prize:—

EARLY IRISH SAGAS.

"I should like to echo Mr. Garnett's plea for an unperverted translation of the early Irish Sagas. There exists in the Pagan literature of Ireland, a body of evidence as to the life, religion, history, and customs of the unchristianised Celt, of the utmost value to historian, ethnologist, and folklorist. No literature of equal antiquity exists in Europe, but the Homeric poems, and an adequate translation of Irish Sagas, literally faithful and unchanged in tone, might give us even better grounds than we now possess for adopting Professor Ridgeway's ingenious hypothesis that the Homeric Greeks were an invading race of Celts. To prove this, however, we need a cumulative weight of reliable evidence, and this will never be satisfactorily obtained if translators are at liberty to embellish, or omit, at their own will.

"The ethnologists will try to discover the origin of many curious customs of to-day in the earliest records of European Aryan nations, and will find traces of totemism, tabu, exogamy, and other pre-Aryan customs—he will wish to identify Celtic gods with Greek or Roman, and trace the growth of Celtic influence—but how can he do it in security, when the translator may wilfully falsify the whole tone of the work on which he relies? The real lover of human nature, too, will rather see life as it was then, in its crude bloodthirstiness and heroic chivalry, than be shown a refined and idealised twentieth-century version of third century life and humanity.

"On all the grounds, we beg for faithful translations."

SCIENTIFIC TOPICS.

In order to prevent the substitution of inior goods in an original bottle, an inventor ho has recently secured a patent on his heme, proposes to embed a dime or other coin the body of the bottle, which, he claims, ill be sufficient inducement to secure the deruction of the vessel when it has been nptied.

✧ ✧ ✧

Much interest is manifested in the offer of 3,000 dollars cash prize by the St. Louis Vorld's Fair authorities to any person who all successfully transmit without wires elecical energy amounting to one-tenth of a orse power 1,000 feet. This achievement, if erformed, would mark a new step in the evelopment of electrical science. Many exeriments have been made in the direction ggested.

✧ ✧ ✧

A photographic copy of the fourth patent sued by the United States was recently seured by the authorities at Washington, who ave been recently engaged in a search to cover some of the oldest papers. The whereouts of the original of this one is not known. was granted on January 29, 1781, and was sued to Francis Bailey, of Philadelphia, and overed a process for "performing punches." he document bears the signature of George ashington, Thomas Jefferson, and Edward andolph.

✧ ✧ ✧

In order to mount photographic prints so at they will not subsequently "cockle" when y the usual plan is to wet them thoroughly, id in the case of gelatine prints especially in arm weather this not infrequently presents fficulties to the unpractised hand. A method mounting dry with glue is as follows, and described by Colonel Noverre: Soak for out twelve hours in three or four ounces of ater one ounce of good Scotch glue, and disolve by heat; this can be done most conniently in a carpenter's glue-pot. After solution stir in two drams of glycerine and filter rough fine muslin. This is to be applied to e back of the untrimmed print, and set ide to dry. When dry it may be trimmed, e mount well wetted all over with a soft onge, the print then laid in position, and bjected to pressure between two pieces of ate-glass, employing a roller press or by nply superimposing about 60lb weight. After out fifteen minutes the mounted print can be moved and allowed to dry. The mounting ue should be of such a consistency that it ves a glazed surface to the back of the print drying, but it should not be so thick as to latinate so long as it remains slightly warm.

✧ ✧ ✧

It is supposed, of course, that both atoms id molecules are exceedingly small. It difficult, indeed (says a writer in the "Cornll Magazine"), to give a clear idea of the inuteness of their dimensions, or to express eir weights by reference to any of the ordiry standards. But some ideas on this subct will be gained when I say that there are ving organisms, which must themselves be ilt up of many molecules, so small that half million of them would lie in a single layer on e surface of a postage stamp; and again, at it has been calculated that out twenty million million million, or ,000,000,000,000,000,000, molecules of a gas uld be contained by a vessel about as big as medium-sized die; that nearly every such olecule would consist of two or more atoms; d that if the gas were reduced to the solid liquid form, as every common gas can be, se twenty million million million molecules uld be packed into a vessel many, many times smaller, small though this may seem to be.

✧ ✧ ✧

Ozotype—a printing method which may be regarded as an auxiliary to carbon printing—was introduced and patented four or five years ago, and whilst at first it claimed a good deal of attention, it appears to have latterly rather hung fire in popularity. Quite simple to perform, it contributes a degree of control and certainty to carbon printing which to many it lacks under ordinary circumstances. Briefly stated, the process consists of printing on the prepared ozotype paper, the sensitive surface of which consists of a bichromate and a manganous salt. This gives a visible image. After washing in water it is squeezed in contact with unsensitised carbon tissue, whereupon the first image is transferred to the carbon tissue, which then needs only to be developed in warm water like an ordinary carbon print. The first and chief obvious advantage is that the manganese image being visible, it may be controlled by printing more or less or locally interrupting the light, as in any print-out process, and the subsequent carbon image follows precisely in depth and gradation. The ozotype print, therefore, is an exact index of what the final print in pigment will be, the formation of the latter being practically automatic.

✧ ✧ ✧

Photography of late years has been zealously developed along two totally divergent paths, for there are those whose energies have been directed towards making each stage of the process more mechanical, each step more automatic, whilst others foster every tendency which makes for individuality and personal control. To these latter the very idea of what is called "time development" is obnoxious, and they not unnaturally cling to the belief that they are able by interference with the progress of development largely to influence the ultimate result. To the believer in scientific or time development the Kodak developing machine, which was exhibited and explained at the Camera Club a short time ago, must strongly appeal, whilst to the class of amateur photographers who use a kodak and welcome the facility of the daylight loading system, a developing machine which dispenses with all necessity for thought, judgment, or skill on the part of the user can be but regarded with satisfaction. For the average kodak user, the kodak developing machine is eminently suitable, and was doubtless devised and constructed for him rather than for the more serious worker. The factors which contribute to its success and popularity are the latitude of the present day sensitive emulsion, which makes considerable over-exposure harmless, and the fact that the average kodaker, through carelessness or ignorance, does more harm than good when he attempts to guide the action of the developer, the blind machine being less liable to error than the ignorant person with both eyes open.

✧ ✧ ✧

The principle of the developing machine is, however, not quite identical with the time development introduced and set forth by Mr. Alfred Watkins. In the latter the time which elapses between applying the developer and the first appearance of the image is noted, and when multiplied by a given factor, the product is the time required for complete development The time of first appearance will depend on length of exposure, whereas with mechanical development the exposures are assumed to be approximately right, or at least to range within the limitation of under exposure and over exposure, beyond which only special precautions could redeem the negative from failure, and hence in an average spool of six exposures, widely varying in subject and conditions, some may be absolutely correct, but the others must necessarily be relatively wrong, and yet not so much so as to dissatisfy the not very fastidious amateur.

✧ ✧ ✧

The order of the three sandstone-producing States whose annual production exceeds in value 1,000,000 dollars has changed within the past year, according to figures recently compiled by the United States Geological Survey. Prior to this time New York held second place, with Pennsylvania third, but now Pennsylvania and New York have changed places. Ohio, the other of the three great sandstone States, is not only still in the lead, but the value of her product has shown a noticeable increase. Ohio's total production during the last year was valued at 2,576,723 dollars, exceeding that of Pennsylvania by 513,641 dollars, and that of New York by 1,245,396 dollars, and her increase over the preceding year is represented by 343,127 dollars. Ohio also holds an interesting place among the stone-producing territories of the world in that here are said to be located the largest sandstone quarries extant, and from these quarries comes the bulk of all the whetstones and grindstones of the country. The value of her grindstone and whetstone product last year was 577,543 dollars. It is this class of Ohio's stone product, too, that is more in demand than her rough stone.

✧ ✧ ✧

Of Ohio's great quarries the one at North Amherst is typical of the sandstone mining. The average height of the walls in the largest quarry is a little less than 125 feet, but in places a depth of 175 feet is attained. The circumference of this pit exceeds a mile and a half. To one who has never seen a quarry of huge dimensions a glance down from the edge of the pit, or upward from a central point at the bottom, is a novelty, to say the least. The layers of stone are so distinct that they may be distinguished from one side of the quarry to the other. Another interesting feature is found in the different colours represented by the various strata. There are different qualities of sandstone to be found in the same pit; the kind used for whetstones or grindstones represents one stratum, while that used for building purposes represents another. Bluestone is a kind of sandstone; it is used for flagging and curbing. Sandstone, it will be recalled, is but sand more or less firmly united. Like in the case of the coal mine many years are usually required to exhaust the supply. At North Amherst it is said to be more than thirty years since the great development of the quarries there was begun.

✧ ✧ ✧

In one of the city squares of Athens, Ga., stands an interesting relic of the civil war—what is probably the only double-barrelled cannon ever made. It was designed by a resident of Athens for use in the Confederate service, the idea being to discharge a projectile from each barrel simultaneously, the projectiles to be connected by a chain. No chain was found to be sufficiently strong, however, to withstand the strain, and the weapon was never tested in actual warfare. The cannon is made of cast-iron, and was molded at one of the local foundries. It is of 3-inch calibre, having a diameter across the muzzles of 8 inches, and across the barrels of 13 inches, while it is 55 inches in length. It is provided with what is familiarly known as a "touchhole" in the breech, connecting with both barrels, so that it could be discharged by igniting a fuse if desired. The idea of the inventor was to connect the balls by a chain several feet in length, the ends of the chain being fastened into each by staples. Chain-shot was often used in naval battles to carry away the rigging of an enemy. It was discharged once after being built, but unfortunately one barrel for some reason did not "go off." The force of the explosion of the other barrel tore the chain from the ball which remained, and gave a curved motion to the projectile. As a result of this accident, it was considered too dangerous to adopt for use, and was stored away, finally being discovered only a few years ago in a shed. It was then mounted upon its present carriage, and placed in the park for an ornament.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

CORK, SEPTEMBER 27.

Yesterday Alderman William Alexander was sworn into office at the Castle with the usual solemnities; and William Humphry and Brent Neville, Esqrs., as High Sheriffs, took the usual oaths at the Tholsel. His Grace the Lord Lieutenant, and a great number of the nobility and gentry, were afterwards magnificently entertained at the Mansion House, in Dawson street.

One day last week an unknown gentleman went to the bank of Messrs. Latouche, and delivered the sum of one thousand and twenty-four pounds in bank notes, for the use of the fund of the Musical Charitable Society for lending money, interest free, to indigent industrious tradesmen. He took a receipt for the money as the gift of a charitable person, which person it is thought it was himself, as at first he said he was to give a thousand pounds towards the charity, but on being told his notes amounted to twenty-four more than the money. "Well," replied he, "let the receipt be for a thousand and twenty-four pounds."

Last Sunday night the noted Foy, charged with being an accomplice with the late Mr. Fitzgerald, etc., in the murder committed in the county of Mayo, etc., arrived in this city under a military escort from Castlebar, and was committed to the New Prison, in order to stand his trial at the next Commission of Oyer and Terminer.

On Sunday evening last, as Mr. Kennan, attorney, of Capel street, was returning to town on horseback, though the Park, he was stopped under the Phœnix by four fellows, armed with hangers and long knives; they desired Mr. Kennan to dismount, which he was about to comply with, when one of the fellows cut the reins of his bridle, another gave him a punch of the hilt of the hanger under the ribs. Finding himself in this perilous situation, he surrendered his purse, containing 22 guineas, also four English shillings, with which they made off into the wood.

It is said that his Grace the Duke of Rutland is so highly pleased with the Irish workmanship in the construction, taste, and finishing of carriages, that he has bespoke a State coach at a very great price, from an artist of this city, and has allowed him two years to finish it. A thousand pounds is said to have been advanced for this work, and if it equals the royal State coach, the price will amount to three thousand pounds.

Yesterday Mr. Justice Wilson committed to Kilmainham Gaol William Fleming and John Fleming, journeymen gardeners, charged with having robbed a house on Donnybrook road, in the county of Dublin, early that morning, of money and other articles, part of which was found upon them when apprehended, going on board a passage-boat at the basin of the Grand Canal.

Saturday last as Mr. Buckton, of Sandymount, near Irishtown, was drawing home his hay, he found concealed in one of the cocks two loaded pistols, two swords, two chisels, a large iron crow, a quantity of powder and ball, and several implements for breaking open houses. It is thought that a gang of villains is lurking about that place, and that the above articles were conveyed into the hay for the purpose of attempting to break open houses in the neighbourhood the first opportunity.

On Sunday morning last was apprehended by George Lowther, Esq., of Kilbrue, county of Meath, and lodged in Trim Gaol, John and Terence Finegan, Thomas Read and Patrick Coventry, all notorious robbers, and in their possession were found three horses, which different persons have proved to be their property.

Extract of a letter from Drogheda, Sept. 29.

"This day being the festival of St. Michael, Maurice Barlow, Esq., was sworn into the office of Mayor, and George M'Entegart and Charles Evans, Esqrs., Sheriffs for the ensuing year.

"On Tuesday night last Mr. Edwards, Surveyor of this town, and Mr. M'Cartney, seized and lodged in his Majesty's stores here, Scotch goods, to the value of seven hundred pounds—viz., plain, spotted, striped, and stitched muslins; plain and stitched muslins and lawn handkerchiefs; upwards of 1,000 yards of ornamental lawn; sisters thread, silk and cotton cloth.

"We are credibly informed that there is now growing in the garden of Mr. Carroll, innkeeper, Dunleer, a cabbage eleven feet high."

DUBLIN, TUESDAY, OCTOBER 2, 1787.

Extract of a letter from Newtownlamavady, September 28th.

"The present serves to give you the earliest information of a melancholy affair which happened last night, about ten o'clock, in Coleraine—Lieutenant Lloyd and Surgeon Jobson, both belonging to the 46th Regiment (two companies of which are quartered at Coleraine), having a dispute, agreed to settle it with pistols, in a room of the inn at that place, which happened to be adjoining the room in which three gentlemen had been sitting. On hearing the report of pistols, the gentlemen forced into the room, but too late to prevent the fatal consequences. Poor Lieutenant Lloyd expired immediately after he had received his antagonist's fire, the ball having passed directly through his heart. Surgeon Jobson escaped unhurt."

Saturday evening Hugh M'Gowran, alias the Morning Star, was apprehended by Alderman Bevan, and committed to the New Prison by Alderman Moncrieffe. As this fellow is a notorious villain, persons who have been lately robbed would do well to see him.

Monasterevan, whose name not long since was scarcely known, is rising into a town of importance. In addition to the extensive storage erected there by the Canal Company, great ranges are built and building by individuals Kilkenny coal, flour, wheat, malt, barley, oats, and timber, daily come up the Barrow in large quantities. Crowds of carriages attend the arrival and departure of the passage boats; the corn and rape markets are beginning. It is computed that there will not be less than 30,000 barrels of rape sold there this year, all raised from bogs hitherto considered of no value.

DUBLIN, WEDNESDAY, OCTOBER 3.

Monday a man of genteel appearance rapped at the halldoor of a person of quality in Dominick street, and requested the servant who opened it to hold his horse, and the other walked upstairs to the lady's apartment, which he had no sooner entered than he pulled out a pistol, and demanded her purse. The lady was so terrified that she was unable to comply, but he rifled her pockets of everything they contained. He then went down stairs, mounted his horse, and was making a deliberate retreat, when the alarm was given. He was pursued by two persons, one on horseback, but not so well mounted as himself, and he made his escape by leaping over a chain that crossed one of the adjacent streets, the pavement of which was repairing.

DUBLIN, FRIDAY, OCTOBER 5.

It is observed that our manufactures, fine arts, etc., are in a progressive state, not only in the metropolis, but in its vicinity, which is apparent from a variety of instances, of which the following are mentioned with pleasure:—At the iron-mills in Fortick's lane, near Drumcondra, are made spades, shovels, and other implements of husbandry; likewise a variety of kitchen utensils, etc., equal to any imported. At the White Flint Glass-house, near Ballybough Bridge, that manufacture is successfully carried on by an opulent company. Plate-glass for coaches, etc., are also made and polished near the North Strand. Add to this, another glass-house is erecting on a very extensive scale near the North Wall; and contiguous thereto, the most large and commodious salt-water Bathing-house hitherto constructed in this kingdom, with distinct apartments for ladies and gentlemen, affording a constant supply of water from a great reservoir when the tide is out, which will render it very convenient to the public, as the great road thereto is now putting into perfect repair for carriages and foot-passengers. We cannot conclude these remarks, without taking notice of the progress of the salt works near Ringsend, etc.

No less than three proclamations have issued in consequence of the apprehensions of war. One for encouraging seamen and landsmen to enter themselves on board his Majesty's ships of war. By this able seamen are to receive £3, ordinary seamen £2, and able-bodied landsmen 20s. bounty money. Another for recalling and prohibiting seamen from serving foreign princes and States, and for granting rewards for discovering such seamen as shall conceal themselves. The third is for commanding all the Magistrates in the kingdom to assist the Captain and Officers of his Majesty's ships in impressing seamen, and seafaring men. This proclamation also holds out a reward to the person who conducts seafaring persons to the ship or vessel, of 20s. for each seaman, besides an allowance of sixpence a mile for every mile those may respectively travel.

Several merchants at the other side of the water have given orders to their factors, from the apprehension of hostilities commencing immediately between France and Great Britain, not to ship a single yard of linen cloth, but to lodge whatever quantity they might purchase in warehouses, in order to await the event of the circumstances that so strongly indicate the approach of war.

Saturday morning last, several boats from Carlow and Athy, arrived at the Grand Canal harbour, laden with coal from the pits of Donane and Clough, and a number more are expected in a few days with the same cargo. The trade now carrying on by this branch of inland navigation is so considerable as to equal that of many second-rate seaports, and promises in a few years to repay the charges of that noble work in the most beneficial manner to the public in general, as well as prove a source of wealth to the present and all future companies.

Monday evening, so early as seven o'clock, Mr. Carrol, an eminent farmer in the county of Kildare, was stopped a little beyond the Canal-bridge, on Naas road, by four fellows, who after obliging him to dismount, searched his pockets, form whence they took five guineas and a half, and a silver watch. They then asked what was contained in his saddle-bags, and understanding that there was but two shirts, with a pair of stockings and a pair of shoes, they decamped towards the Commons of Fox and Geese, first cutting the bridle and saddle-girth, to prevent a pursuit.

RATES OF SUBSCRIPTION.

"DUBLIN PENNY JOURNAL."

Post free to any part of Ireland, Great Britain, Australia, New Zealand, Canada, United States.

Twelve months, 6s 6d; Six months, 3s 3d; Three months 1s 8d.

Printed and published for the proprietors at 90 Middle Abbey street, Dublin, by W. F. Dennehy, to whom all choques and money orders should be made payable.

Dublin Penny Journal

A Magazine of Art. Archæology, Literature, and Science

Vol. I., No. 51. DUBLIN, SATURDAY, MARCH 21, 1903. PRICE ONE PENNY.

SIMON'S COURT TOWER,

DONNYBROOK, CO. DUBLIN.

From GROSE'S "ANTIQUITIES OF IRELAND," 1791.

SIMON'S COURT TOWER,

DONNYBROOK, CO. DUBLIN.

(From Grose's "Antiquities of Ireland.")

This ancient structure is situated to the east of the river Dodder, and about a quarter of a mile from Ball's Bridge. From the vestiges of its foundation, the building was of considerable extent, and seems to have been one of those castellated houses so common in Ireland in turbulent ages.

As Simon's Court is the property of the Dean and Chapter of Christ-church, who have large possessions about it, this castle was probably built to secure their granges, their cattle, and corn from the rapacity of the Wicklow mountaineers, who perpetually plundered the vicinity of Dublin.

The arch exhibited in the view and a few walls are all that remain of this edifice. There are winding stairs leading to the top, from whence is a delightful view of the Bay, Donnybrook, the city, and much of its environs.

This view was drawn by T. Cocking, anno 1790.

Simon's Court Castle is the residence of James M'Cann, Esq., M.P., and the Tower shown above is situate in the grounds of his demesne enclosure.

THE MUSIC OF THE GAEL.

ITS SPECIAL CHARACTERISTICS.

By Rev. RICHARD HENEBRY, Ph. D.

I.

Our music is an integral part of our civilisation. Our old life was interwoven with golden threads of music, ever harmonious with the colour scheme of the fabric There was no feeling of the heart, thought of the brain or word from the lips but had each its counterpart in song. Where expression failed music became its complement and carried the thought home. Every action and occupation of a lifetime had its accompanying song. If, then, our language enshrines our nationality and must be preserved, our music, that cannot be divorced from it, must be preserved also.

As our language was ousted by a foreign tongue so, also, a foreign music ousted ours. There is some difference in the operation, however. One may learn our own and the foreign language, but the two systems of music are totally irreconcilable.

Of reliable sources of information concerning Irish music I know only four in existence now. They are—1st. The mouths of the people. True Irish music may still be heard from old women singing, boys whistling, and girls lilting or jigging, as we call it. 2nd. The music of the Irish bagpipe, whereof the chanter still retains, probably roughly, the Irish scale; also fiddlers who still play in the Irish manner. One who has ever heard it can tell at once when a fiddle speaks with the Irish voice. 3rd. The valuable introduction to O'Curry's "Manners and Customs," written by Dr O'Sullivan, late Professor in the Queen's College, Cork A study of this paper will soon convince anyone that the great and practically the only difference separating Irish and modern music is one of scale. But this is a fundamental difference. 4th. The introduction to Bunting's collection of Irish music. Bunting was a person who instituted a contest for Irish harpers in Belfast a little over a hundred years ago. He proceeds from the standpoint of modern music and regards everything not in conformity with it as "imperfect." However, through his teaching we can reconstruct the system of tuning the harp and glean a good deal of valuable information on the method of playing besides. Unfortunately, this book is now excessively rare. It seems a pity when so much useless matter is falling from the press every day, that somebody does not give us the valuable portions of Bunting's book in a magazine or newspaper article. However, it has been used as a source by O'Sullivan, and so probably the whole substance of it may be consulted at any ordinary library.

Outside those there are no authorities on Irish music. Moore's melodies and all published collections must be excluded. Everybody who has turned his attention to the matter must notice the great difference in tone-colour between the rendering of an Irish air, let us say one of Moore's, by a modern singer to piano accompaniment and the same air rendered by an old woman in the traditional manner, who is utterly ignorant of modern music. Also the fiddle in the hands of an old, untrained performer at home speaks Irish, whereas all the art and skill of Herr Joachim could not take a single Irish note out of the same instrument. The reason is that the two musical systems differ fundamentally in scale. The intervals into which the octave is broken to constitute a scale are not coincident and there rise two music schemes that are entirely incommensurable.

There are fundamental differences in scale and in the key system. The differences of interval are minute but subtle, they give the peculiar colour and character to Irish music. It is evident, therefore, that music composed on one of those scales cannot be played on the other; in other words, it is impossible to play Irish airs on the modern scale, or upon a modern instrument. It follows, then, that all collections of Irish music written in the modern notation are wrong, though perfect Irish music may be made from them by a bagpiper, or one who plays the fiddle in the Irish way. For the fiddle has a finger-board that will give infinitesimal variations in tone, according to the stopping position of the finger on the string. On the other hand, the piano has fixed notes, and besides its scale does not exactly coincide either with the Irish or the modern scale. Hence if one attempts an Irish air on that instrument the characteristic tone-colour evaporates immediately and the result is by no means Irish music. This fact is not generally known.

Besides those enumerated already there are in addition differences in phrasing, feeling and technique, or execution. To me there is nothing so wholly discomposing as listening to an Irish air sung with all the saccharine expression of the vaudeville stage to a jangling piano accompaniment. When I compare the wrong tone scheme, the bad phrasing, the pert, exaggerated, hysterical and false expression with the traditional version of the same air as sung by an old woman, with its full, rich intervals and simple feeling, the veritable voice and refrain of the Gaelic heart, the contrast between modern sham and Celtic truth becomes too poignant for my equanimity.

To preserve Irish music the modern kind must be rigidly excluded; tin whistles, brass bands, concertinas, but especially the do, re, mi, fa of the schoolmistress. Let boys be taught the fiddle from traditional players, though the technique of handling that instrument might be borrowed from the modern style. Especially the Irish bagpipes which should not be confounded with the Highland bag-pipe must be brought into fashion again and children must be diligently taught to play them according to the pure method. It is a sample of the virulent ignorance that possessed our fathers concerning their own things that some time ago in the first ecclesiastical seminary which I entered in Ireland, the students were permitted the exercise of every musical instrument with the strict exception of the Irish bag-pipes. To meet the call for instruments the making of chanters might be encouraged, and even flutes and fifes could be holed to sound the notes of the Irish scale, to the very notable profit of Irish music. Little girls should be taught to sing as their mothers do, and every Irish boy should be able to whistle correctly quite a collection of Irish tunes.

In another direction all traditional tunes still extant must be collected as soon as possible from the people so that blunders and perversions of previous collectors may be corrected, especially Moore's, and in order that the great body of unpublished music may be snatched from the mouth of the grave. Persons with a good knowledge of the theory of modern music and a scientific grasp of acoustics must go amongst the people and collect the Irish scale or scales, in fact produce a scientific treatise on our musical system, and devise a method of notation. Then having found our scale our own do, re, mi, fa can be taught our children.

II.

Our literary monuments attest that poetry and music were zealously cultivated in ancient Ireland. The poetic social caste in Ireland with their laws and customs maintained and regulated by the institutes of the State represents a unique development amongst the culture-folk of antiquity. And though poetry was held in such great honour, still there are abundant evidences to show that music divided with it the patronage of the whole nation.

It would be vain to try to collect and set forth anything but a meagre list of the references to music and harping occurring in the old books. However, take the following short story which is typical of those that glorify the skill and wizardry of musicians. I translate from Vol. III. p. 213, of O'Curry's "Manners and Customs." "The harp sprang from the wall afterwards, and nine men were killed. And it came to the Dagda, and he played the triad from which a harper is named, to wit, slumber music and laughing music and weeping music. He played weeping music until their women shed tears, he played laughing music for them so that their women and their boys smiled, he played slumber music for them and the host slept." Many such exhibitions of musical skill are recorded, notably one of Craftine, the celebrated harper, in a remarkable narrative called "Orgain Dind Rig," published by Whitley Stokes in a recent number of the "Zeitschrift f. Celt. Philologie." Such appreciation of the power of music, practically amounting to deification, is not found in the old literature of any other nation.

We find mention of various musical instruments, perhaps twenty in all. Those were horns and pipes of sundry kinds, besides stringed instruments. The last-named kind comprised the Timpan, the "Ochttedach" (the eight-stringed), and the Harps. There were three harps—the "crott," the "menn-chrott," and the "ceis." The "crott" was the principal harp—viz., the one now designated by the vulgar term "clairseach." The "menn-chrott" was a smaller kind, for the name means "kid-harp," and the "ceis" was very probably a small harp used to accompany the "crott." This "ceis" must have gone out of use long ago, for the scholiast who glossed the "Amra Coluimb cille" in the "Lebor na Huidre" some time in the tenth or eleventh century was so ignorant of its use that he gives three or four guesses at its definition. The names of the various portions of the harp are preserved in a poem in the Royal Irish Academy quoted by O'Curry, "Manners and Customs," Vol. III., p. 256. The pertinent stanza which I translate reads like a sad prophecy now. It says:—

"The tuning-key will be lost
The 'teda' (strings) will be broken
The 'cor' will fall from the 'lam-chrann'
And the 'comm' will be carried off by the stream."

The "cor" was the harmonic curve containing the tuning-pegs, the "comm" was the sounding-box, and the "lam-chrann" was the front beam of the harp. The instrument was small, being only about 30 inches high, and rested upon the knees in playing. The modern Italian harp is an entirely different instrument.

There seems to have been a presentiment in the minds of people that the harp was doomed to be lost. Thus Dr. Lynch of Galway, who wrote his great Latin work "Cambrensis Eversus" about the time Cromwell was devastating the country, says, Vol. I, p. 314:—"It may not, therefore, be by any means a useless labour if I succeed in describing accurately for my readers the form of the harp lest it should be involved in the universal ruin which I fear nothing but the hand of God alone can now avert from my country." And thereupon follows his description. However, the harp was destined to live for two cen-

ies longer notwithstanding that Crom-l's soldiers broke every single specimen y could lay hands on. For since the very t day the English had to do with Ireland, l especially during the seventeenth century, is evident from their own writers of that iod, senchaides, rhymers, and harpers were d in particular disfavour because their real ctions of transmitting and perpetuating all t was distinct in the national life and civi-tion were instinctively known. They were ond all classes irreconcilably Irish Irish-n, and hence they were detested and exter-nated.

rom the supernatural powers of execution ribed to harpers in our old literature, and m the evidences in the same sources that sic was such a prominent feature in the ional economy that a special caste was ignated for its cultivation, we may con-de that they really attained a high de-e of proficiency. But we have external dence of the fact, too, though coming from ater period, Giraldus de Barry, called aldus Cambrensis, a Welsh-Norman priest ited Ireland in 1185 in the train of John, of Henry II., King of England. During three following years he composed a opography of Ireland" and a "History of Conquest of Ireland" in Latin. His books filled with the wildest sort of mythological ries, and utterly unreliable. However, if read them carefully he might succeed in ting sufficient grain out of the chaff to er a few pages of foolscap. Those are matters that came under his personal ob-vation and are apparently true. A passage this kind occurs in his "digressio volup-sa," as he called his chapter on music. He s—"It is in musical instruments alone that industry of this nation has attained a dable degree of refinement, surpassing im-asurably the skill of all other nations. Bold l rapid, yet sweet and agreeable, the notes the Irish harp are quite unlike the slow l drawling melody of the British instrument which we are accustomed. It is amazing w correct musical time can be observed in bold and hurried sweeping of the fingers, l how, amid all those quavers and the mazy ltitude of cords the master-hand combines s sweet rapidity, this uneven smoothness, s discordant concord, into a flowing strain harmonious melody."

Subsequently he was struck by "the tink-gs of the small strings under the deep notes the bass." Dr. Kelly in editing Dr. Lynch's Cambrensis Eversus," vol. 1, p. 308, note, otes a musical authority named Galilei, who ote about 1550, as saying that Irish musi-ns kept the nails of their fingers long orming them with care into the shape of e quills which strike the strings of the net." A MS. History of Ireland written out 1636 now in the Royal Irish Academy brary, says "the Irish are much addicted to usick generallly and you shall find but very w of their gentry, either man or woman, but n play on the harp, alsoe you shall not find house of any account without one or two of ose instruments, and they always keep a rper to play for them at their meals and all her times, as often as they have a desire to reate themselves or others which comes to eir houses therewith."

A Mr. Gunn, who published an inquiry re-ecting the performance of the Harp in the ghlands of Scotland, Edinburgh, 1807, re-rks that the instrument was discontinued re in 1734. He gives a rapturous appreciа-n of the playing of one O'Kane, who was id to have frequently drawn tears from his dience. A man named Jamieson, who wrote Introduction to Letters from the North of otland, quoted by Hardiman in the first lume of his Irish Minstrelsy, London, 1831, ys—"The gentlemen of note were educated Ireland, to which country all who adopted sic or poetry as a profession were unifor-lly sent to finish their education till within e memory of persons still living."

(To be continued.)

Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

FETHARD, a small sea-port, post-town, and parish (formerly a Parliamentary borough), in the barony of Shelburne, county of Wexford, and province of Leinster, 15¾ miles (S.) from New Ross, and 81 (S.W.) from Dublin, on the bay of Fethard; containing 2,153 inhabitants, of which number 320 are in the town. This place is supposed to have derived its ancient name, "Fiodh Ard," from the abudance of wood in the neighbourhood, though at present no part of the country is more destitute of timber. Robert Fitz-Stephen, on his first invasion of the country, landed his forces in a bay about a mile to the south of the town, since called Bagenbon bay, from the names of the ships Bag and Bon, both of which, immediately after his landing, he burnt in the presence of his men, telling them that they must either succeed in their enterprise or perish in the attempt. After the settlement of the English in Ireland, this place was given by Strongbow to Raymond le Gros, who had married his sister Basilia, and who is said to have erected a strong fortress here for the protection of his newly-acquired territory. Basilia, with the concurrence of Fitz-Stephen, granted the church lands and tithes of the whole lordship to the abbey of St. Thomas, near Dublin; and some of its earlier lords obtained for the inhabitants a charter of incorporation. The castle afterwards became the episcopal residence of the Bishops of Ferns, and here Alexander Devereux, the last abbot of Dunbrody, and the first Bishop of Ferns after the Reformation, died in 1556, and was buried in the church, in the aisle of which his tombstone still remains. In 1648, the manor of Ferns was exchanged by Bishop Andrews for value belonging to the Loftus family.

The town was incorporated in 1613 by charter of Jas. I., by which the corporation was made to consist of a portreeve and 12 free burgesses, in whom was vested the right of nominating freemen to form a commonalty, and of returning two members to the Irish Parliament. They had also the power of holding a court of record weekly, for the recovery of debts not exceeding five marks, with the privilege of a market and fair; but this corporation has long been extinct. The borough continued to send two members to the Irish Parliament till the Union, when it was disfranchised, and the £15,000 awarded in compensation was paid to Charles, Marquess of Ely, and C. Tottenham, Esq. The neighbourhood abounds with objects of interest, among which are the remains of the abbeys of Dunbrody, Tintern, and Clonmines. On the narrow promontory of Bagenbon Head are the remains of an encampment, said to have been formed by Fitz-Stephen on his landing; and at Fethard are the ruins of a castle, at one angle of which is a round tower in good preservation. Bagenbon Head projects considerably from the line of the coast; the land is high, and the shore bold; the water is deep, with a stiff clay bottom, covered with sand, extending nearly to the base of the cliffs.

HER LONESOMENESS.

When little Elizabeth whispers
Her morning love to me,
Each word of the little lisper's
As she clambers on my knee—
Hugs me and whispers "Mommy,
Oh, I'm so glad it's day
And the night's all gone away!"
How it does thrill and awe me—
"The nights all gone away!"

"Sometimes I wake, all listenin',"
She sighs, "and all's so still!—
The moon and the stars halt-glistenin'
Over the window-sill;—
And I look where the gas's pale light
Is all turned down in the hall—
And you ain't here at all!—
And oh, how I wish it was daylight!
. . . And you ain't here at all!

"And oh," she goes eerily whining
And laughing too as she speaks,
"If only the sun kept shining
For weeks and weeks and weeks!—
For the world's so dark, without you,
And the moon's turned down so low—
'Way in the night, you know,—
And I get so lonesome about you!—
'Way in the night you know!"

CLOUDS WITHOUT DUST.

For 20 years the assertion of Dr Aitken, based on a series of beautiful experiments, that clouds cannot form in the air without dust particles to serve as nuclei for condensation, has been accepted, but now Dr Aitken himself has made a little sensation by disproving his own previous statement. He has found that certain gases, such as hydrogen peroxide, sulphuretted hydrogen and chlorine, when present in the atmosphere, are converted by the action of sunlight into nuclei, upon which cloudy condensation can take place. Accordingly, although dust is ordinarily necessary for cloud formation, yet clouds may form in dustless air miles above the earth. It should be added that when his original conclusion was published Doctor Aitken admitted the possibility that sunshine might create gaseous nuclei, but he has only recently established the fact that it does.

SCIENCE AGAINST GAMBLING.

The republication in English of the famous essay of the great French mathematician, Laplace, on the theory of probabilities serves to recall the harm that has resulted from a lack of general information on this subject. The confirmed gambler and the reckless speculator do not know how continually they fly in the face of the teaching of science. A recent reviewer remarks:—"If in a game of even chances red turns up 20 times in succession, it is still an even chance whether red or black turns up the 21st time: but no amount of mathematical reasoning will enable the gambler to realise that a previous run of bad luck gives no grounds for the expectation of recovering his losses by a run of good 'uck in the future." It was partly to combat the superstitions of gamblers and others that Laplace wrote his essay.

JOHN O'DONOVAN.

BY EBLANA.

I.

Hereditary to O'Donovan of Dun Cuirc
Is this territory as his fortress land.
To him without tribute belongs Maghmoill,
And the level plains down to the Shannon.
—O'Heerin.

In a note in the "Book of Rights," the subject of this article himself tells us that Dun Chuirc was another name for Bruree, as one of the seats of Corc, King of Munster, and as such the possessors held the lands, gan cios (without tribute) extending along the western bank of the River Maigh or Maigue down to the Shannon, or, according to O'Heeran, from the Shannon to the summit of Slieve Logher, and from Bruree to the River Maigue westward to the verge of Kerry.

The reason why the O'Donovans were free from tribute was that they were of the Eoghanacht or Eugenian race, that is, they were descended from Eoghan Mor, the eldest son of Oillol Olum, King of Munster in the second century. This King decreed that his three sons, Eoghan Mor, Cormac Cas, and Cian, and their posterity should be exempt from the payment of annual tribute to the royal household, and declared their possessions Free States.

From their ancestor, Mogha Nuadhat, the whole of the southern half of Ireland was designated Leath Mogha or Moha's Half.

In the course of time the MacCarthys were recognised as the senior branch of the Eugenian line, and according to Smith, the O'Donovans were next in royal dignity and power.

They derived their name from Donabhan or Donovan, son of Cathal, who was killed in a pitched battle by Brian Boroimhe in the year 977.

This was in retaliation for the killing by Donovan of Brian's brother, Mahon, on whose death Brian composed a very pathetic and eloquent poem.

A son of this O'Donovan, also called Cathal, commanded the Hy Cairbre at the Battle of Clontarf.

They were variously known as Chiefs of Clan Cathal from these Cathals, Chiefs of Hy Cairbre Aodhbha or Aeva, the district of West Carberry, in the county Cork, where they resided at Castle Donovan and Dynasts of the Ui Figeinte, one of the great tribes of Munster, situated in the territory between the rivers above-named. They were frequently styled Kings of these places and of Bruree, which was a royal seat; also Coshma and Crom in Limerick. At the latter place they built a castle, of which they were dispossessed by the Fitzgeralds, who adopted from it their war cry—"Crom-aboo"! And so the O'Donovans bade "Farewell to the Maigue." After this they were driven into Corca Luighe by the Fitzgeralds, O'Briens, and Burkes. In the 17th century Edmund O'Donovan, in consequence of a local quarrel, moved from Bawnlahan, in the county Cork, to Gaulstown, in the county Kilkenny, on the 18th of March, 1643, and he was killed at Ballinabeega, in the latter county, in the battle between General Preston and the Duke of Ormond.

In the first volume of the "Kilkenny Archæological Journal," Dr. O'Donovan, in an article on "Language and Burials," gives an account of his namesake, a John O'Donovan, of Slieve Greine, now called Tory Hill. It contains an elegy which begins:—

O John O'Donovan my own grief thou art,
Thou beauteous son of high blood of generosity,

and goes on to recount the names of all the places connected with the family.

He tells us that he was descended maternally from the Gaul Burkes of Ballinlaw and Gaulskill, and through them from the Red Earl.

He says that he heard from his uncle, Patrick O'Donovan, that he (Patrick) was fifth in descent from Edmund Dean, the outlaw or tory, from whom Tory Hill was named, and who was the proprietor of it and of the surrounding townlands in the beginning of the 17th century. This noted hill immediately bordered upon O'Donovan's native place; for he was born at its foot, on his father's farm of ait an eige mor, or Attatimore, meaning "the place of the great house," otherwise called Blackneys, in the parish of Kilcolumb, barony of Ida, and county of Kilkenny.

But, strange to say, he fell into an error as to the date of his birth. No doubt he became so absorbed in matters outside himself, that he relied upon the testimony of others, whose memory had failed them on this point, and never thought of verifying their account at the proper source. Accordingly, he gives the date of his birth as the 3rd of August, 1809. Other accounts have it the 9th of July, in the same year.

But the Rev. William Carrigan, of Durrow, Queen's County, has taken the trouble to search the Register, and this is the result:—

"Attatimore, 26th July, 1806. Bap. Jno., Par.: Edmond Donovan and Ellenor Haberlan. Spo.; Edmond Wall and Ellenor Neal. "J(ohn) Fitzpatrick (P.P.),"

or, as translated from the contracted Latin:—

"Attatimore, 26th July, 1806. Baptism, John, his Parents, Edmond Donovan and Ellenor Haberlan. Sponsors, Edmond Wall and Ellenor Neal. John Fitzpatrick, P.P."

His father died in July, 1817, and on his death-bed repeated several times to his sons, who were present, his descent, and desired his eldest son, Michael, always to remember it.

At nine years of age, young John O'Donovan began Latin and Irish, and though very delicate, made good progress. He transcribed Irish well in 1819.

In 1821 he was sent by his brother to school to Waterford, which was about four miles from their home. Here he learned arithmetic, English grammar, and book-keeping. During the years 1821-2-3, he paid long visits to his uncle, Patrick O'Donovan, from whom he first caught a love for ancient Irish history and traditions, especially those of Wexford, Carlow, and Kilkenny.

In the latter year the lease of his brother's farm of 40 acres expired, and it had to be given up. Accordingly, on the 19th November, Michael O'Donovan set out for Dublin, taking his brother with him, and having secured a situation for himself in a merchant's office, he sent John to a Latin school, again defraying the cost of his education. Here the future Ollave studied for four years.

Then, in 1827, he became acquainted with Mr. Hardiman, author of the "History of Galway" and of "Irish Minstrelsy," who was Commissioner of Public Records. He remained with him till March, 1830, during which time he copied Peter Connell's "Irish Dictionary," to be seen in the British Museum, and other MSS., and also assisting in various literary ways in the office.

At this time he tells us his health got exceedingly bad, and he was invited by his friend Myles John O'Reilly, Esq., of Heath House, Queen's County, to spend some months with him in the country for change of air.

He spent several months with this good friend, during which time his health improved wonderfully.

But he was not idle. Like the busy bee he improved every occasion of laying in a store of honey for future use. And here he found true honey, indeed. He read the works of Ussher Ware and Colgan, and every other book bearing upon Irish history or antiquities. He also acted as tutor to O'Reilly's son.

Neither was his pen idle. He translated the "Book of Fenagh." He also made extracts from the "Annals of the Four Masters" relating to the O'Reilly family. This, no doubt, formed the subject of frequent conversations between him and his host. One of the plans formed was that the latter should reassume the style and title of The O'Reilly. But, unfortunately, his circumstances did not permit of it, and the project was abandoned. Doubtless, it had been O'Donovan's suggestion, or, at all events, it had arisen from his industry induced by gratitude in translating and unfolding the history of the O'Reilly family. He little dream to what it would afterwards lead. His zeal for his friend had been the first inducement to him to study the "Annals"; and this, in time, led him to the Obar Mor, or great work of his life.

It was to this period of his stay at Heath Lodge that allusion was made to him in a poem by his friend, Lageniensis*—"The Land of Leix."

'Twas here in youth the gentle Ollamh trod,
Who little dreamed of future learned fame
When studious pacing o'er th' elastic sod,
He braced by step and thought a vigorous frame.
Later to life emerged that well-known name
He guileless lived, frank, cordial, generous, kind
True sons of rank and talent friends became
Loving as humbler men in him to find,
Leal warmth of heart and soul with intellect combined.

In a note the rev. author of these lines says:—

"Allusion is made to the celebrated Irish linguist, genealogist, historian, antiquary, and topographer, John O'Donovan." He adds, that in after life he enjoyed his friendship, and that he (O'D.) often alluded to the pleasure he afforded him to ramble over Carter's Hill which was convenient to Heath Lodge.

Thus time passed in mingled work and recreation. But O'Donovan realised that he must soon take leave of his friend; and perhaps his decision was hastened by the sad news he received of the death of Edward O'Reilly, the author of the "Irish Dictionary."

He, thereupon, applied to Lieutenant Larcom for employment. He had known Larcom since 1828, when he gave him some lessons in Irish. He soon received a reply offering a situation at a very small stipend.

O'Donovan hesitated, especially as his friend and host was opposed to his acceptance of it, saying that "it would come to nothing."

However, the future ollamh decided that it was better to accept it. It was something, and it was time that he should seriously take up the work of his life. His brother, too, was always at hand to assist him as far as his own straitened means would allow, until such time as it might be no longer necessary. In any case, his health being now restored, it was not right that he should longer remain at Heath House, welcome though he undoubtedly was.

After his return to Dublin he received a letter from Hardiman asking him was it a fact that he had given up his idea of going

* Very Rev. Canon O'Hanlon, author of the "Lives of the Irish Saints," etc.

Maynooth. He replied stating that he uld take some time to consider it. It is ar from this that he had had some idea of ning the priesthood. But he finally relin- ished it. No doubt he felt called to serve s God and his country in the world.

Up to this point we are indebted to his own tobiography for most of the above account his family and early life. The circumstance nich induced him to write it to his friend, e Rev. Dr. Todd, will appear in the proper ace.

And now, in the year 1829, having accepted e post on the Ordnance Survey of Ireland der Petrie, he set to work with a will. It as the Historical Department, and his work as the examination of the Irish MSS. and ecords, with a view to obtaining the nomen- ature to be used on the maps.

He was now thrown into close companion- ip with Eugene O'Curry, George Petrie, e Rev. Drs. Todd and Reeves, James arence Mangan, W. Wakeman, Martin Ha- rty, and others.

During the years 1832-3, O'Donovan wrote any articles on Irish topography and history the old "Dublin Penny Journal" of much lue and originality, and to Duffy's "Hiber- an Magazine."

He also visited nearly every part of Ireland, d recorded the results of his observations beautiful caligraphy, to the Ordnance Sur- y Office in Great Charles street.

Mr. John O'Daly, of Anglesea street, who rchased some of O'Donovan's books, after s death, communicated to the "Kilkenny rchæological Journal" a letter written by at great scholar to his friend, Myles Reilly, Esq., in 1836. He was then but com- encing his archæological studies, and the ters needed revision. But "they throw an teresting light on the laborious investiga- ons which resulted in his becoming a living cyclopædia of Irish historical and topo- aphical lore."

In this letter to Myles O'Reilly, O'Donovan ys he had undertaken to reduce the counties Ireland back to territories. But he expe- nced some difficulty in distinguishing be- ween Dal Riada and Dal Araidhe. About ese two names he also wrote another letter om Finnuisge, or Phœnix Park.

In other communications he describes the vers of Ireland.

The maps contain 144,000 names, including ose of 62,000 townlands. The single volume blished by the Ordnance Survey in 1837, ntains a long Irish text and translation om the "Dinneseanchus," all the work of Donovan.

During that and the following years he la- ured incessantly searching out and identify- g the ancient monuments and remains, Pagan d Christian, cromleachs, pillar-stones, ghams, towers, duns, raths, castles, churches, beys, battle-grounds, etc., besides exploring e surrounding country, and all objects of terest or of history; even the legends con- cted with them he carefully set down, and ten commented wittily upon the more ex- avagant of them. One of these, of Pagan igin, was so grotesque that he announced s disbelief in these words:—

"Why should not the Irish be allowed to ll lies as well as the Greeks and the Romans, ly that they did not do so plausibly or ingeniously?"

But for him many places in Ireland would main to this day unidentified. As an in- ance, he was the first to discover that howle, in Shillelagh, in county Wicklow, the same as the ancient Achaidhabhla, or chadh-na-abhall, the field of apples.

On one occasion when, in pursuance of some these explorations, O'Donovan, accompanied one of his colleagues, the Rev. Dr. Reeves, as proceeding towards Fermanagh, they ere conversing in the Latin language, to e wonder and perplexity of their fellow- passengers. At length some of the latter in- quired whether they were foreigners, and were doubtless convinced that such was the case, by this English reply which they re- ceived:—

"We are from de oder side of de Oder!"

In the year 1840 he lost his brother and earliest friend, Michael O'Donovan, and he had not yet contracted other family ties.

But great and onerous as were his labours on the Ordnance Survey, O'Donovan found time for other work of a kindred nature.

In 1841 he contributed many articles on topography and history to the "Irish Penny Journal," abounding in valuable and original information. Among the best of these were seven essays "On the Origin and Meaning of Irish Family Names."

The readers of this, the new "Dublin Penny Journal," have had an opportunity of perusing these wonderful essays recently in the 17th to the 24th numbers inclusive.

He refutes the errors of Beauford and Val- lencey in their assertion that the Irish, like the French, took their names from the soil, and he proves that, on the contrary, they gave their names to it. Then, too, in the efforts of those writers to sustain their theory, they were obliged to twist and turn the forms of these names out of all reason and character. He gave several instances; among them that of his own name. He denies Beauford's as- sertion that O'Donovan comes from Hy Dun Navan, or chiefs of the hilly country on the river. He admits Bruree to be a dun-abhann, or dun of the river, but justly maintains that his first ancestor of the name was so-called because, according to Mac Firbis, he was a brown-haired chief—Don dubhan.

He denounced the Irish people of the dark days after the Boyne, who changed, trans- lated, or otherwise disguised their names, "which by all manner of means they strove to make English or English-like," and also by the rejection of the prefixes O and Mac. He instances a wretched scion of the great house of O'Neill—a name of European fame, many of whose bearers had so often humbled the power and pride of England, but who had at last been "conquered" by craft or cun- ning and poison—who changed his name from Felim O'Neill to Felix Neele, and who had been epigrammed by MacConby, the poet, in cutting language, ending with:

(To be continued.)

AFTER DEATH.

BY DANIEL O'CONNELL.

"I wonder, love, if after death,
You and I shall sit together,
Talking of our earthly days,
Of the pleasant woodland ways
Where we've walked in soft May weather,
Drinking in the violet's breath?

"I wonder, love, if after death,
You and I shall still remember
Gusty evenings in December,
When we spoke of old-time places,
With the firelight in our faces,
And the wind shrill on the hearth?

"Can it be that we shall meet,
Knowing God, but not forgetting
This orb in its starry setting,
With its June sun and its sleet,
After death?

"Will your face, love, then be fairer;
Will your voice be sweeter, rarer;
Will your steps be dearer, lighter;
Will your eyes be bluer, brighter
After death?

"Oh! if cold should be our meeting—
No clasped arms and no lips greeting—
Woe no human tongue could utter,
Dread no mortal voice could mutter.
Would be death!"

THE UNITED STATES.

DERIVATION OF THEIR NAMES.

Maine.—So called from the province of Maine, in France, in compliment to Queen Henrietta, of England, who, it has been said, owned that pro- vince. This is the commonly received opinion.

New Hampshire.—Named by John Mason, in 1639 (who, with another, obtained the grant from the crown), from Hampshire County, in England. The former name of the domain was Laconia.

Vermont.—From the French "vert" "mont," or green mountain, indicative of the mountainous nature of the State. The name was first officially recognised January 16, 1777.

Massachusetts.—Indian name signifying "the country about the great hills."

Rhode Island.—This name was adopted in 1644 from the Island of Rhodes, in the Mediter- ranean, because of its resemblance to that Island.

Connecticut.—This is the English orthography of the Indian word Quon-ehta cut, signifies "the long river."

New York.—Named by the Duke of York under colour of the title given him by the English Crown in 1664.

New Jersey.—So called in honour of Sir George Cartaret, who was governor of the Island of Jer- sey, in the English Channel.

Pennsylvania.—From William Penn, the founder of the colony, meaning "Penn's Woods."

Delaware.—In honour of Thomas West, Lord de la Ware, who visited the bay, and died there in 1610.

Maryland.—After Henrietta Maria, Queen of Charles I., of England.

Virginia.—So called in honour of Queen Eliza- beth, the "virgin queen," in whose reign Sir Wal- ter Raleigh made the first attempt to colonise that region.

North and South Carolina was originally in one tract, called "Carlina," after Charles IX of France, in 1504. Subsequently, in 1665, the name was altered to Carolina.

Georgia.—So called in honour of George II. of England, who established a colony in that reign in 1732.

Florida.—Ponce de Leon, who discovered this portion of North America in 1512, named it Floriday, in commemoration of the day he landed there, which was the Pasques de Flores of the Spaniards, or "Feast of Flowers," otherwise known as Easter Sunday.

Alabama.—Formerly a portion of Mississippi Territory, admitted into the Union as a State in 1819. The name is of Indian origin, signifying "Here we rest."

Mississippi.—Formerly a portion of the pro- vince of Louisiana. So named in 1800, from the great river on the western line. The term is of Indian origin, meaning "long river."

Louisiana.—From Louis XIV. of France, who, for some time prior to 1763, owned the territory.

Arkansas.—From "Kansas," the Indian word for "smoky water," with the French prefix "arc," bow.

Tennessee.—Indian for "the river of the big bend," i.e., the Mississippi, which is its western boundary.

Kentucky.—Indian for "at the head of the river."

Ohio.—From the Indian, meaning "beautiful." Previously applied to the river which traverses a greater part of its borders.

Michigan.—Previously applied to the lake, the Indian name for a fish-weir. So called from the fancied resemblance of the lake to a fish-trap.

Indiana.—So called in 1802, from the American Indians.

Illinois. From the Indian "illini," men, and the French suffix "ois," together signifying "tribe of men."

Wisconsin.—Indian term for a "wild-rushing channel."

Missouri.—Named in 1821 from the great branch of the Mississippi which flows through it. Indian term, meaning "muddy."

Iowa.—From the Indian, signifying the "drowsy ones."

Minnesota.—Indian for "cloudy water."

California.—The name given by Cortes, the discoverer of that region. He probably obtained it from an old Spanish romance, in which an imaginary island of that name is described as abounding in gold.

Oregon.—According to some, from the Indian oregon, "river of the west."

OUR WEEKLY STORY

THE WHITE ROAD.

BY INGRAM CROCKETT.

It was at the close of a winter day. The sun had set, and low in the west was a luminous carmine paling above a thin, far-curving wood. The air sparkled with frost. A day of sunshine and cloudless blue had but softened the tops of the fantastic snowdrifts; curved them over the grotto-like excavations made by the wind, and hung them with pendants of crystal. The town was wrapped in a haze of smoke, out of which electric lights flashed suddenly like splendid stars. And all around lay the silent whiteness of the rolling hills.

The passers-by on the principal street, a straight road that came over the hills from the country, bustled through the town, and loitered away into the hills again, hardly noticed him as he walked slowly among them. Some, with hearts inclined to charity, saw that he was ragged, but also that his rags overlapped in a manner suggestive of warmth; that his long overcoat was buttoned well over his chest, and so stayed their hands from alms. He might have been a tramp on whom some kind soul had bestowed several suits of cast-off clothing that were now worn all at once; or he might have been a farmer late in returning from his marketing; or, perchance—a passing student seeing the face under the light for a moment, paused, looked back and wondered.

"It has been years, years since I first heard the voice," said he who thus moved through the town, speaking softly. "And often it has been like a far bell heard through the mist—but now"——

He was silent. He had reached the edge of the country with its wide skies and brightening stars, and its long, white road leading on.

"Ah, this is the way," he murmured. "What place do you seek?"

The dreamer, for such he had been called in the old, old days, started and looked up.

"Surely I heard one speak," he said to himself, and then aloud:

"I know not even if it be a place; but I hear a voice constantly like a far bell calling me, and I cannot but follow—indeed when I have turned aside with a will to shut my heart to that voice, I have heard a horrible clangour, as if the iron tongue of a great bell beat upon my brain—and yet often the voice seems so far away I am doubtful if I have heard it at all, and stand waiting, listening, listening."

"But you have no doubt now, and was it not your heart saying, this is the way?"

"Whence is this question? I see only the wide, deep sky and the silent stars, and the long white road leading on. Whence is this question, and who is he that says: 'You have no doubt now.'"

And again he heard, as if it were a faint echo: "You have no doubt now."

"No," said the dreamer, as if impelled by some indwelling power to answer, speaking slowly: "I have no doubt now."

"But why?" Out of the dreamer's heart, or out of the stillness of the night, the question came.

"But why? Here are only the voiceless. How can they answer your heart, how can they assuage your doubt?"

The dreamer lifted his eyes to heaven, and, as he looked, he saw the glory of all the stars. Far through the deeps ran the flame, the colour, the beauty of hope. No longer was he chilled as if face to face with death, above whose shrouded form glittered the cold lights of the great void. No longer was his soul bowed with the "weary weight of all this unintelligible world," for he had suddenly become buoyant, and the silence was thrilled with music ineffable.

And yet he was but a broken man, walking alone, on a winter night, after wandering the road oft travelled during boyhood—the road to the old home in the hills.

The road ran level for a little way, after leaving the town; and yes, there it was on the left, by the gate leading up to an orchard—the cottonwood he could never forget. How broad it was and how tall, lifting its great crown, dark, dome-like, against the stars. During the years he had been gone it seemed to have remained unchanged.

But no; when he went nearer, he found its massive, furrowed trunk showed signs of decay. The road-workers had encroached upon it and cut away some of its anchor roots, and the bark had sloughed off near the ground, exposing a deep, V-shaped hollow. A few withered leaves clung to its branches, the remnants of that countless throng that had so often showered him with cool melody as he had rested there, on many a summer day, while the world went by on the dusty highway. As the memories flooded his soul he leaned against the tree, as one might put his head upon the shoulder of a brother, and for a moment all was blurred. What matter if he be old and poor,, and the way to the home be long—what matter for the bitter weather, the loneliness of the night—here was a friend he had not seen for many years, here was one to greet him, to welcome him back. And what did this friend care for his rags—his failure—his sins—was he not come again to the old faith, the old communion, to enter into rest?

At last leaving the cottonwood, as one leaves a dear comrade, with many a backward glance, the dreamer passed slowly on. He seemed to be the only human being astir. Now and again a gleam of light from some far window was flung across the night, but these soon failed, as sleep descended on the land.

The road had begun to lift in a long slope, and when he reached its crests, the lights of the distant town sparkled in winding rows and cast a mellow glow against the sky. He stood for a while looking at them; but they did not speak to him of warmth, of comfort, of love, of home. And then he turned his face to the descending way, to the shadowy valley, for here the road dipped slowly under overarching trees—the country was more broken, the homesteads more scattered. How often, in his wanderings, he had longed for this spot whence he could look down into his own land. He was glad that the world had passed it by, that its trees still stood, that its fields were overrun with bramble and sassafras, that its fences were zigzag, interwoven with sprouts, overlapped with clematis and wahoo and hazel. He buttoned his coat closer about his throat, and lay down on a bed of leaves under a broad overhanging clump of green-brier.

The climb had tired him; he would rest awhile on the breast of Night. He had heard much of the coldness of the stars, but they did not seem cold to him. Rather they were like bright spirits drawing nearer and nearer, as in that olden time they drew near to the shepherds on the hillside of Bethlehem. From where he lay he could look down the road that melted into darkness under the trees. The wind was asleep. From far-away came the call of the horned owl, but there was no other sound except now and again the trees seemed to whisper to one another.

This was the language his soul longed for—a spirit speech inexpressible. And oh, the lovely stars, an encircling glory. It seemed to him he had never seen them so beautiful, so pure, so benificent. The earth seemed bathed in light as soft as thistle-down, and all the hideous things of men to have been forgiven, forgotten, to have passed away for ever. How sweet the thought that he was about to enter the old boyhood scenes, the hallowed ground; and how fitting that he should be welcomed by the night, by the trees, by his companions of a long life—the stars—and that the road into the valley should be all in white. He lay in a happy reverie. The very touch of the greenbrier, the very smell of the leaves, the kindly shelter of the shambling fence—these wrought in him emotions never to be wedded to words. Presently, piercing a bank of clouds in the east, he saw a crescent of faint rose. It was the full moon showing part of its disc. Then it disappeared, and, after an interval of some minutes, rose slowly, a great golden globe, into the clear sky. The peaks of the clouds out of which it had come were edged with the beautiful light. Far down the road, through a rift in the trees, a shaft of silver lay broken against the darkness. The moon's beauty seemed to add to the stillness. The twigs whitened under its beams, but the shadows were deeper, as if they had suddenly taken shape out of profounder darkness. The dreamer watched the heaped snow in a little cup-shaped leaf on a white oak near by. It had caught a moonbeam full on its breast, and was sparkling in rose and green. It wore the very colours of far El Nath. It, too, rejoiced in the eternal light!

"This, also, is the house of God, and this is the gate of Heaven," murmured the dreamer, as he took up his journey.

How well he remembered this gentle dipping of the road under the dogwoods. It was here he had first met her whom he had "loved long since, and lost a while."

Then the woods were in the full flush of spring; white, and pink, and delicate green. Somewhere near by a chewink was singing. And she, too, was singing when he came suddenly around a bend in the road, and met her face to face; and then in a moment her song had passed into a blush and on into silvery laughter, that was as sweet as the song, and he knew her for the teacher, and deliberately retraced his steps, walking by her side, insisting that where he was going was as near this way as any other. Indeed, he quite forgot where he was going as he looked into her eyes. Miles it may have been, they went that day; he had no thought of the distance, or of the time as they loitered on beneath the dogwoods, gathering spring-beauties and violets. All about them the sunlight was sprinkled through the branches in little flames that wavered and danced over the greening earth, and when these butterfly-like sun-flames rested upon her lovely face, her rich brown hair, she became to him the incarnation of the spirit of beauty, and there was nothing on earth beautiful enough with which to compare her. A dove, like a voice bidding farewell to the world, called through the stillness. A wood-thrush sang somewhere in the blossoms above them, a song like a shower of music of mellow flutes and golden bells. What did he say to her that day? He could not tell. It was all like a lovely dream. Somehow when they had come to a spring in the valley—thrice blessed spring with the

moss around its rocky basin, and its crystal stream—their hands had touched—he had looked one clear instant into her soul—and there was no need of words. Reverently the dreamer trod that way this winter night. There were no blossoms above him now. Yes, folded in ice-cased buds they waited for the spring—and under his feet the spring-beauties and the violets were wrapped safely in an inviolate promise. Ah, surely she who had gladdened his life—she who had been the very flower—the very fragrance of his soul, was not less than the flowers—surely she awaited him in some immortal wood, and there Love should lead them as of old.

Much of the wood had been cut away, but after an hour or more he found the spring. A few Christmas ferns thrust their green blades through the snow. The little cedars that he remembered so well—he had given her a sprig, bidding her note its fragrance—had apparently cared nothing for towering growth, but were clustered on the knoll above the spring in the old familiar way—content to be heart-to-heart friends of the lowly sparrows, ever green amid the joys and sorrows of the year—emblems of the calm, the unfading life to come.

He knelt and looked down into the clear water. In its crystal depths the stars trembled. And the soul of the dreamer leaped to the thought, "Heaven is all about us!" And again he saw her face smiling upon him as on that bright day, long ago, when she had called the spring her mirror, kneeling before it to arrange a flower in her hair.

Slowly, with this memory in his heart, the dreamer again sought the road, that now skirted the base of the hill, with woods on one side and open fields on the other. At the bottom of the hill the road turned abruptly to the left, and crossed the creek, over a long bridge. As a boy, he remembered, he could never cross the bridge in summer without stopping to lean on its railing, and to watch the water slipping by the long grasses and curling into tufts of yellow foam through the drift that lodged there. Far up the creek, from this point, the great sycamores grew. As they had a way of trembling in white spirals up from the deeps where the sky was as blue as the sky above, and the clouds went by in an endless procession, far under the brown water. The water-boatmen, too, would be rippling the water there, and the dragon-flies weaving magic circles of jewelled light.

The bridge appeared almost as he had left it. The trees on the banks were thinner, and new timbers had taken the place of the old, doubtless two or three times. But there were the sycamores bearing the golden moon in their branches, and there, far below, the water slipped by—only now it ran more rapidly, in a narrow current, through banks of fluted mother-of-pearl—and the stars on its bosom were the dragon-flies that dipped and sparkled at the water-brake and were never still. And from the face of the creek a thin white mist arose and floated among the trees in shimmering strands of gossamer. The railing of the bridge was thickly gemmed with frost. Idly the dreamer wrote a word there—over, and over, and over—and when he looked, behold! it was her name.

From the end of the bridge he could see the oaks of Henry Hill that topped the farther side of the valley, and beyond them lay the old home. In dark, broken lines they rose against the sky, and he thanked God that they, too, had been spared with so many of the old landmarks.

Slowly he walked on, stopping now and again to look about him, and to rest against some familiar tree by the way. It was two miles from the bridge to the oaks of Henry Hill, and before he had walked half the distance the sky gradually became overcast, and he felt the touch of snowflakes on his cheek. The stars melted away in the grey haze; the moon hung like a globe of frosted silver high above the tree-tops. The wind awoke and ran sighing through the branches. The sere leaves of the scrub oaks that still clung to their boughs shook chillily. The air grew keener. The feet of the dreamer were growing heavy. Still, at first there arose within him the old boyish spirit, and he smiled at this growing wildness of the night. Several times he caught playfully at the falling snowflakes. But presently he missed the stars, and the benign light of the moon. The landscape was walled in with darkness, and even the white road was like a dim ray of light, a glimmering streak soon dulled and lost in the gloom.

When he reached the oaks of Henry Hill, the snow was falling fast, and utter darkness had fallen over the land. He had grown numb and weary, and groped his way to the shelter of a great white oak, and sat there motionless. And as he looked out through the night, towards the old home, behold the winter was gone and the apple-trees were in bloom. He saw the grey roof of the old homestead rising out of the billows of a pink and white sea, and the brown thrush was singing—ah, such a song! Never before had he so felt the divinity of Nature—never had his spirit so cried out, beholding—yet without words—never had he been so thrilled with the beauty and mystery of it all. And again the scene changed, and he saw the harvest field, and one like unto himself pitching the golden sheaves, and the face of his father—brown, grave, bearded—and the face of his mother so gentle, so benign as she looked upon him. And as the dusk fell he heard the song of the reapers, and the new moon hung lower over Henry Hill, and by its side a little white star. And then he saw her coming through the gathering shadows to where he lay resting beside the sheaves, and her eyes were sweet with love, and she walked as if she came to wake him out of sleep—and bending down, she laid her hand upon his forehead, as softly as the falling of a snowflake, and smiled upon him, and kissed him—and then—he was looking up into her face in a strangely beautiful land, and the night had passed away.

But silently, on Henry Hill, the snowflakes fell—silently, silently—and after a while, at the foot of the oak, there was a spotless mound of white.

THUNDERSTORMS.

Statistics in regard to the frequency of thunderstorms in various parts of the world are given as follows by a German periodical:—Java, 97 days in the year; Sumatra, 86; Hindustan, 56; Borneo, 54; the Gold Coast, 52; Rio Janeiro, 51; Italy, 38; West Indies, 36; South Guinea, 32; Buenos Ayres, Canada, and Austria, 23; Baden, Wurtemberg, and Hungary, 22; Silesia, Bavaria, and Belgium, 21; Holland, 18; Saxony and Brandenburg, 17; France, Austria, and South Russia, 16; Spain and Portugal, 15; Sweden and Finland, 8; England and the high Swiss mountains, 7; Norway, 4 Cairo, 3. In East Turkestan, as well as in the extreme north, there are almost no thunderstorms. The northern limits of the thunderstorms are Cape Ogle, northern part of North America, Iceland, Nova Semelja, and the coast of the Siberian ice sea.

KING BRIAN'S LAST BATTLE

(An Ancient Icelandic Legendary Narrative, taken from "The Story of Burnt Njal," translated by Sir George W. Dasent in 1861.)

Earl Sigurd bade to his feast at Yule Earl Gitli, his brother-in-law, out of the Southern Isles; he had to wife Swanlanga, Earl Sigurd's sister; and then came, too, to see Earl Sigurd that King from Ireland whose name was Sigtrygg. He was a son of Olafrattle, but his mother's name was Kormlada. She was the fairest of all women, and best gifted in everything that was not in her power, but it was the talk of men that she did all things ill over which she had any power.

Brian was the name of the King who first had her to wife, but they were then parted. He was the best natured of all kings. He had his seat in Connaught, in Ireland; his brother's name was Wolf the Quarrelsome, the greatest champion and warrior. Brian's foster-child's name was Kerthialfad. He was the son of King Kylfi, who had many wars with King Brian, and fled away out of the land before him, and became a hermit; but when King Brian went south on a pilgrimage, then he met King Kylfi, and then they were atoned, and King Brian took his son Kerthialfad to him and loved him more than his own sons. He was then full grown when these things happened, and was the boldest of men.

Duncan was the name of the first of King Brian's sons; the second was Margad; the third Takt, whom we call Tann—he was the youngest of them; but the elder sons of King Brian were full-grown, and the briskest of men.

Kormlada was not the mother of King Brian's children, and so grim was she against King Brian after their parting that she would gladly have him dead. King Brian thrice forgave all his outlaws the same fault, but if they misbehaved themselves oftener, then he let them be judged by the law, and from this one may mark what a King he must have been. Kormlada egged on her son Sigtrygg very much to kill Brian, and she now sent him to Earl Sigurd to beg for help. King Sigtrygg came before Yule to the Orkneys, and there, too, came Earl Gitli, as written before. . . Then King Sigtrygg stirred in his business with Earl Sigurd, and bade him go to the war with him against King Brian.

The Earl was long steadfast, but the end of it was that he let the King have his way, but said he must have his mother's hand for his help, and be King of Ireland, if they slew Brian. But all his men besought Earl Sigurd not to go into the war, but it was all to no good. So they parted on the understanding that Earl Sigurd gave his word to go; but King Sigtrygg promised him his mother and the Kingdom. It was so settled that Earl Sigurd was to come with all his host to Dublin by Palm Sunday.

Then King Sigtrygg fared south to Ireland, and told his mother Kormlada that the Earl had undertaken to come, and also what he had pledged himself to grant him. She showed herself well pleased at that, but said they must gather greater force still. Sigtrygg asked whence was this to be looked for.

She said there were two Vikings lying off the west of Man, and that they had thirty ships, and she went on: "They are men of such hardihood that nothing can withstand them. The one's name is Ospak, and the other's Brodir. Thou shalt fare to find them, and spare nothing to get them into thy quarrel, whatever price they ask."

Now King Sigtrygg fares and seeks the Vikings, and found them lying outside off Man; King Sigtrygg brings forward his errand at once, but Brodir shrank from helping him until he, King Sigtrygg, promised him the kingdom and his mother, and they were to keep this such a secret that Earl Sigurd should know nothing about it; Brodir, too, was to come to Dublin on Palm Sunday. So King Sigtrygg fared home to his mother and told her how things stood.

After that those brothers, Ospak and Brodir, talked together, and then Brodir told Ospak all that he and Sigtrygg had spoken of, and bade him fare to battle with him against King Brian, and said he set much store on his going. But Ospak said he would not fight against so good a king.

Then they were both wroth and sundered their band at once. Ospak had ten ships and Brodir twenty. Ospak was a heathen and the wisest of all men. He laid his ships inside in a sound, but Brodir lay outside him. Brodir had been a Christian man and a mass-deacon by consecration, but he had thrown off his faith and become God's dastard, and now worshipped heathen fiends, and he was of all men most skilled in sorcery. He had that coat of mail on which no steel could bite. He was both tall and strong, and had such long locks that he tucked them under his belt. His hair was black.

It happened one night that a great din passed over Brodir and his men, so that they all woke, and sprang up, and put on their clothes. Along with that came a shower of boiling blood. Then they covered themselves with their shields; but for all that many were scalded. This wonder lasted all day, and a man died on board every ship.

Then they slept during the day. On the second night there was again a din, and again they all sprang up. Their swords leaped out of their sheaths, and axes and spears flew about in the air, and fought. The weapons pressed them so hard that they had to shield themselves, but still many were wounded, and again a man died out of every ship. This wonder lasted all till day.

Then they slept again the day after. But the third night there was a din of the same kind, and then ravens flew at them, and it seemed to them as though their beaks and claws were of iron. The ravens pressed them so hard that they had to keep them off with their swords, and cover themselves with their shields; and so this went on again till day, and then another man had died in every ship. Then they went to sleep first of all, but when Brodir woke up, he drew his breath painfully, and bade them put off the boat. "For," he said, "I will go to see Ospak."

Then he got into the boat, and some men with him, but when he found Ospak he told him of the wonders which had befallen them, and bade him say what he thought they boded. Ospak would not tell him before he pledged him peace, and Brodir promised him peace; but Ospak still shrank from telling him till night fell.

Then Ospak spoke and said—"When blood rained on you, therefore shall ye shed many men's blood, both of your own and others. But when ye heard a great din, then ye must have been shown the crack of doom, and ye shall all die speedily. But when weapons fought against you, that must forbode a battle, but when ravens pressed you, that marks the devils which ye put faith in, and who will drag you all down to the pains of hell." Then Brodir was so wroth that he could answer never a word, but he went across at once to his men and made them lay his ships in a line across the sound, and moor them by bearing their cables on shore at either end of the line, and meant to slay them all next morning.

Ospak saw all their plan, and then he vowed to take the true faith, and to go to King Brian, and follow him till his death day. Then he took council to lay his ships in a line, and punt them along the shore with poles, and cut the cables of Brodir's ships. Then the ships of Brodir's men began to fall abroad of one another when they were all fast asleep; and so Ospak and his men got out of the firth, and so west to Ireland, and came to Connaught.

Then Ospak told King Brian all that he had learnt, and took baptism, and gave himself over into the King's hand. After that King Brian made them gather force over all his realm, and the whole host was to come to Dublin in the week before Palm Sunday.

Earl Sigurd Hlodverson busked him from the Orkneys, and Flosi offered to go with him. The Earl would not have that, since he had his pilgrimage to fulfil. Flosi offered fifteen men of his band to go on the voyage, and the Earl accepted them, but Flosi fared with Earl Gitli to the Southern Isles. Thornstein, the son of Hall of the Side, went along with Earl Sigurd, and Hrafn the Red, and Erling of Straumey. The Earl came with all his host on Palm Sunday to Dublin, and there, too, came Brodir with all his host.

Brodir tried by sorcery how the fight would go, but the answer ran thus, that if the fight was on Good Friday King Brian would fall, but win the day; but if they fought before they would all fall who were against him. Then Brodir said that they must not fight before the Friday.

On the fifth day of the week a man rode up to Kormlada and her company on an apple grey horse, and in his hand he held a halberd; he talked long with them. King Brian came with all his host to the Burg; and on the Friday the host fared out of the Burg, and both armies were drawn up in array. Brodir was on one wing of the battle, but King Sigtrygg on the other. Earl Sigurd was in the mid battle.

Now, it must be told of King Brian that he would not fight on the fast day; and so a shieldburg (a ring of men holding their shields locked together) was thrown round him, and his host was drawn up in array in front of it. Wolf the Quarrelsome was on that wing of the battle against which Brodir stood; but on the other wing, where Sigtrygg stood against them, were Ospak and his sons. But in mid battle was Kerthialfad, and before him the banners were borne.

Now the wings fall on one another, and there was a very hard fight. Brodir went through the host of the foe, and felled all the foremost that stood there, but no steel would bite on his mail. Wolf the Quarrelsome turned then to meet him, and thrust at him thrice so hard that Brodir fell before him at each thrust, and was well nigh not getting on his feet again; but as soon as ever he found his feet, he fled away into the wood at once.

Earl Sigurd had a hard battle against Kerthialfad, and Kerthialfad came in so fast that he laid low all who were in the front rank; and he broke the array of Earl Sigurd right up to his banner, and slew the banner-bearer. Then he got another man to bear the banner, and there was again a hard fight. Kerthialfad smote the man to his death at once, and so on one after the other all who stood near him. Then Earl Sigurd called on Thorstein, the son of Hall of the Side, to bear the banner, and Thorstein was just about to lift the banner, but then Asmund the White said—"Don't bear the banner, for all they who bear it get their death." "Hrafn the Red," called out Earl Sigurd, "bear thou the banner." "Bear thine own devil thyself," answered Hrafn. Then the Earl said "'Tis fittest that the beggar should bear the bag," and with that he took the banner from the staff and put it under his cloak. A little after Asmund the White was slain, and then the Earl was pierced through with a spear.

Ospak had gone through all the battle on his wing; he had been sore wounded, and lost both his sons, ere King Sigtrygg fled before him. Then flight broke out throughout all the host. Thorstein Hall of the Sides' son stood still, while all the others fled, and tied his shoe string. Then Kerthialfad asked why he was not as the others. "Because," said Thorstein, "I can't get home to-night, since I am at home out of Ireland." Kerthialfad gave him peace. Hrafn the Red was chased out into a certain river; he thought he saw there the pains of hell down below him, and he thought the devils wanted to drag him to them. Then Hrafn said, "Thy dog, Apostle Peter, hath been twice to Rome, and he would run the third time if thou gavest him leave." Then the devils let him loose, and Hrafn got across the river.

Now Brodir saw that King Brian's men were chasing the fleers, and that there were few men by the shieldburg. Then he rushed out of the wood, and broke through the shieldburg and hewed at the King. The lad, Takt, threw his arm in the way, and the stroke took it off, and the King's head, too, but the King's blood came on the lad's stump, and the stump was healed by it on the spot. Then Brodir called out with a loud voice, "Now, let man tell man that Brodir felled Brian!"

The men ran after those who were chasing the fleers, and they were told that King Brian had fallen; and then they turned back straightway with Wolf the Quarrelsome and Kerthialfad. Then they threw a ring round Brodir and his men, and threw branches upon them; and so Brodir was taken alive. Wolf the Quarrelsome cut open his belly, and led him round and round the trunk of a tree, and so wound all his entrails out of him, and he did not die before they were all drawn out of him. Brodir's men were slain to a man. Fifteen men of the Burner's fell in Brian's battle, and there too fell Hallder, the son of Gudmund the Powerful, and Erling of Straumey.

After that they took King Brian's body and laid it out. The King's head had grown fast to the trunk."

X.

NOTES AND QUERIES.

THE KEATINGS OF NICHOLASTOWN AND GARRENLEA, CO. TIPPERARY.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Drumcondra, March 3, 1903.

Sir.—Perhaps some of your readers could let me have a little information re. the above families. I believe they held Loghlahery Castle, near Cahir, and buried at Derragrath, and Dangandargan, nigh Cashel. The Keatings of Garrenlea and Knockagh, I have heard, were younger branches of the Keatings of Nicholastown. Unfortunately, there appears to be no historical work relating to Tipperary in the National Library, from which information could be had.—Yours truly,

T.M.

THE ROSCOMMON PEERAGE.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Dublin writes:—Can any reader of the "Dublin Penny Journal" gives an account of the Roscommon Peerage. The last earl died in about 1842, when the title was disputed by Thomas Dillon Boyle. There was allowed a committee of Privileges before the House of Lords at the time. The "Directory" said the last Earl's needy heir was his uncle, Peter Dillon, of Dublin city, which Thomas Dillon of Boyle said was not true.

THE SONG OF THE SILVER SKATES.

I sing the song of the silver skates—
Of cheeks as red as the rose of June,
And the joyous pulse that palpitates
To the merrily measured tune.
And the flood of the full-orbed moon
Flows out of her glistening gates,
As with many a rhythmic sway and swing
I follow the crystal course and sing
The song of the silver skates.

I sing the song of the silver skates,
I float wherever my fancy leads;
The stars' bright sparkle scintillates
In the flash of my flying steeds.
The deep-hushed hollow heeds
And the hill reverberates
The tuneful tinkle whose ripples ring
Till the wandering woodland echoes bring
The song of the silver skates.

I sing the song of the silver skates—
Of the mirth that mellows the frosty air
When the wind's rare wine exhilarates
The hearts of the ones who dare.
Oh, come with me and share
The frolic feast that waits!
And blithesome as the birds of spring
We'll wander where we will and sing
The song of the silver skates.

DR. MAGINN.

FROM A DRAWING BY MACLISE, SEVENTY YEARS AGO.

DR. MAGINN.

A FAMOUS IRISH LITERATEUR OF THE LAST CENTURY.

[The following sketch of the life of the once famous Dr. Maginn (whose picture by Maclise we give above), and appreciation of his literary gifts, was written by another Irishman of considerable literary powers, who made a remarkable figure in perhaps the most remarkable "cause celebre" ever tried. It is from the pen of the late Dr. Kenealy, the counsel for the Claimant in the Tichborne Trial.]

I.

The man who in some golden eventide has walked along the shores of the Great Deep, and watched the sun, after a day of darkness and tempest, gradually sinking in the horizon, until at length its bright disc is hidden altogether in the blue caverns of the ocean, must possess a bosom indeed cold, if he muses not a while on the scene which he has just witnessed. Around him roll the waves, no longer crested with the sunshine, but bearing on their brows the dark shadow of the coming night; before his eyes is spread a vast expanse of water, mingling far off in the distance with the heavens, and offering to the contemplative heart a type of the wide waters of eternity. Silence is in the sky, and by the sandy beach; the ripple of the billow is the only sound that breaks at intervals upon his ear. Slowly and solemnly he paces there, wrapt in reflection, and worshipping in thought the majesty of nature. Anon the sky becomes darker, and the stars walk forth like young brides, all beautiful and gay; and lastly, comes the moon, shining as an angel of poetry, wakening up all the fair and celestial feelings of his soul, making him in love with all creation and created beings, and bringing him, for an interval, under that seraph-like and virtuous spell which every spirit has sometimes felt, and which exalts it for a moment to a kindred with things of ethereal essence. And thereupon the man rests and ponders long.

Like the imaginary picture we have drawn, is the course of genius. Like that sun it speeds onward in majesty and splendour; the hurricane and cloud may wrap it from our eyes, but it shines not the less magnificently in its own place; brightness is in its starry path, and power in its footsteps; like that sun again it performs its course, and fades away into the Abyss of Space; like it is followed by the bright moon, a symbol of the fame which survives its departure. For as the moon is the reflection of the sun's glory, so is fame the reflection of Genius, and both are immortal.

It would be difficult to find anyone to whom the foregoing similitude would better apply, than to the late William Maginn, so long the leading periodical writer of the day—the kind friend, the affectionate and delightful companion—the man, in all the noblest senses of the word. Crossed, and darkened, and embittered by clouds, as many a sunny day has been, was his career while he lived; sorrow had cast her shadow over his soul; poverty and neglect lay upon him like an eclipse; the Hope, which in the morning of his manhood rose resplendently in the distance, and cast around his path imaginary triumphs, tropies, and applause, had disappeared as he proceeded, and like the mirage of the desert, left only wretchedness and disappointment; one by one he had observed those who commenced life with knowledge and intellect far inferior to his own, with prospects less brilliant, and recommendations less powerful, outstrip him in the race, and bear away the honours and rewards, while to him there fell but a scanty apportionment of either; calumny had added materially to the list of his errors, exaggerating those that were but ordinary, and inventing where she could not find a sin, and sneer and sarcasm from the meanest quarters, had done their worst against his character; his heart had begun to grow old and a-weary of the world, and that innate sunshine of the mind which never deserted him, but was present even in the gloomiest circumstances, scarcely supported him amid the many troubles that sprang up like tempests in his path—but immediately he was dead, his life was lamented by universal assent, as if it had been some national calamity; the many who had been politically opposed to him during his whole life, deplored his decease as if one of their own kindred had fallen; Genius came and wept over his bier; Envy masked her bitterness, and followed among his mourners; even those who had pursued him while living, with slander, did not dare to utter one word of detraction over his grave, and his fame at length arose and hovered about his tomb like the silver moonlight.

The variety of his writings proves the amazing versatility of his mind—their excellence is an emblem of its wealth and beauty. Poetry, romance, and criticism, parody, translation, and burlesque—of these there are enshrined amid the vast collection of his compositions, examples as perfect and splendid as any in the language, and such as if presented to the world at one view could not fail to astonish, to gratify, and to instruct it.

As a poet he left behind him writings that breathe of the divinity of genius, and would be sure to immortalise his name, had he bequeathed no other memorials of his intellect, realising as they do, almost to the letter, the praise of Proclus in his dissertation on Plato, "the lineaments of poetry in all their lustre!" As a scholar he was perhaps the most universal of his time, no subject being unknown to him, or beyond the reach of his reading; far more various in his learning than Voltaire, far more profound and elegant than Johnson; rivalled, perhaps, only by Peter Bayle, or that erudite old man, James Roche, of Cork, whose wonderful memory and riches of scholarship, now comparatively unknown, will be the delight of some future time. As a political writer he was once pronounced, by no mean authority, to be "the greatest in the world," and although perfection in that

attainment is scarcely worth the ambition of a lofty mind, it would be hard to name any other author of the present time, except Sydney Smith, who was at once so witty, so philosophical, so elegant and earnest in political discourses. As a conversationist he was known for the liveliness of his fancy, the diversity of his anecdotes, the richness and felicity of his illustrations, the depth and shrewdness of his truths, the readiness of his repartee, and the utter absence of anything like dictation to those who came to listen and to be instructed; "idem lœtus et præsens, jucundus et gravis tum copia, tum brevitate mirabilis. Lastly, as a man, he possessed the most child-like gentleness and simplicity, the greatest modesty, the warmest heart, the most benevolent hand, with the most scanty means. From faults he was not free, from wild irregularities he was not exempt. But great genius is seldom perfect; its excesses must be forgiven when they are counterbalanced by fine qualities. "Summi enim," says Quintilian, "sunt homines tantum." The rock upon which Steel and Burns split, the sole blot upon Addison, the only stigma upon Charles Lamb, that which exiled Fox from the Cabinet of England, and reduced Sheridan to poverty and shame, was the ruin, too, of the late William Maginn. But let us draw over it the veil of charity, and remember that he was a man.

Such is the brief character of Maginn. Let us now follow it with a few anecdotes of his life.

William Maginn was born in July, 1794, in Cork. His father was a schoolmaster of some repute, and was the proprietor of an academy in Marlborough street, in that city, which was then considered the principal one in the south of Ireland, and liberally patronised by the families of the county. The abilities of young Maginn displayed themselves at a very early age, and were so successfully cultivated, that in his tenth year he was advanced far enough to enter Trinity College, his tutor there being Dr. Kyle, afterwards Provost of the University, and subsequently Bishop of Cork. In college he passed through the classes with distinction, gained several prizes, and gave rich promise of his future years; and was the reputed author of a poem, entitled "Æneas Eunuchus," which caused no little excitement, by the eccentricity of its fancy, and the boldness of its thoughts. Returning to Cork, he assisted for some time in the management of the school, and on his father's death, which took place, we believe, when Maginn was little more than twenty, he took on himself the burthen of the entire establishment, and conducted it with singular success. The degree of Doctor of Law was conferred on him in his twenty-fourth year, an unusually early period, and one which we believe is without parallel in Ireland.

Cork was, at that time, in the dawning of that taste for literature, and scientific inquiry, which has since rendered it so celebrated, and conferred on it the name of the Athens of Ireland. A number of ingenious young men had formed themselves into a society for the diffusion of knowledge, and of this club Maginn became a member, and soon distinguished himself above all the others for the depth and universality of his reading. To one of his satirical turn, the opportunity for exercising his wit, which the foibles of the various members presented to him, was too tempting to be overlooked—and accordingly we find him, at this early period, levelling his shafts at such of his associates as were the most prominent in absurdity, priggishness, or pretension—and flinging about him epigrams and jests, as wildly and liberally on the small people of the beautiful city, as in after years on the Chancellors and Ministers of the British Empire.

The publication of "Blackwood's Magazine," which was commenced in 1817, opened a field favourable to the display of Maginn's talents, and he lost no time in availing himself of so popular a medium for the insertion of his lucubrations. In all his contributions there was a profusion of wit and learning which flashed on the public with a splendour to which they were unused. Scarcely one appeared in which there was not something libellous; but the sting was so beautifully applied, and so mitigated by the surrounding fun, that it was difficult seriously to quarrel with the author; and Mr. Blackwood seemed to take as strong a delight in publishing the sarcasms, as Maginn in writing them. The following extracts from Mr. Blackwood's Letters to the Doctor, in 1820, show how heartily the old man enjoyed a scourging article:—

"Edinburgh, 23rd November, 1820

"My Dear Sir—It has been so far fortunate, that this month has been kept back for the article on Captain Parry's Expedition, as it has enabled us to insert your admirable attack on Professor John, which you will see has not lost any of its points by the hands it has passed through. It was his doctrine and discoveries with regard to freezing, and not heat, which "Brewster's Journal" proved to be stolen from the Philosophical Transactions, and therefore your notice of his book on heat was altered. The other alterations, I have no doubt, you will approve of, and, to add to the joke, O. P. is baptised Olinthus Petre, D.D., of T.C.D.

"I fear that you will think that too great liberties have been taken with Holt's letter, but really we felt that they were necessary. I am sure you will not object to such a puppy charlatan as Brande being substituted for Tommy Thompson."

The Doctor had not at this time communicated his name to Blackwood, nor had he, what is much more singular, demanded payment for his writings. The following extract will show that, whatever was the Doctor's delicacy, Blackwood, with his accustomed liberality, acted as became him:—

"I hope you will like this number of Maga, which I think one of our standard ones. I need not say how much it owes to you, and I cannot say how much I owe you for your most effectual assistance. Your contributions have now been so numerous and so valuable, in the truest sense of the word, that I trust you will allow me to return you some acknowledgment, for I cannot repay you for the kind and valuable aid you have given me. If you will not accept money, I trust you will allow me to send you books, and you would do me a singular favour if you would send me a list of those that would be acceptable to you. It is very awkward of me to ask you to do this; but ignorant as I am of what passes, or what you would most prize, I would not like to send you works you did not want, and I must, therefore, beg of you to send me a good long list."

Dr. Moir thus tells the story of the first meeting between Blackwood and Maginn, when the latter paid a visit to Edinburgh:—"I remember having been informed by Mr. Blackwood, that the Doctor arrived in Edinburgh on Sunday evening, and found his way out to Newington, where he then resided. It so happened that the whole family had gone to the country a few days before, and, in fact, the premises, except the front gate, were locked up. This the Doctor managed, after vainly ringing and knocking, to open, and made a circuit of the building, peeping first into one window, and then another, where everything looked snug and comfortable, though tenantless. He took occasion afterwards to remark that no such temptations were allowed to prowlers in Ireland.

"On the morning of Monday he presented himself in Prince's street—at that time Mr. Blackwood's place of business—and formally asked for an interview with that gentleman. The Doctor was previously well aware that his quizzes on Dowden, Jennings, and Cody, of Cork (perfectly harmless as they were), had produced a ferment in that quarter, which now exploded in sending fierce and fiery letters to the proprietor of the magazine, demanding the name of the writer, as he had received sundry notes from Mr Blackwood telling him the circumstances; and on Mr. Blackwood's appearing, the stranger apprised him of his wish to have a private conversation with him, and this in the strongest Irish accent he could assume.

"On being closetted together, Mr. Blackwood thought to himself, as Mr. Blackwood afterwards informed me, 'Here at last is one of the wild Irishmen—and come for no good purpose, doubtless.'

"'You are Mr. Blackwood, I presume,' said the stranger.

"'I am,' answered that gentleman.

"'I have rather an unpleasant business then with you,' he added, 'regarding some things which have appeared in your magazine. They are so and so—would you be so kind as to give me the name of the author?'

"'That requires consideration,' said Mr. Blackwood; 'and I must first be satisfied that——'

"'Your correspondent resides in Cork, doesn't he? You need not make any mystery about that.'

"'I decline at present,' said Mr. B. 'giving any information on that head, before I know more of this business—of your purpose—and who you are.'

"'You are very shy, sir,' said the stranger; 'I thought you corresponded with Mr. Scott, of Cork,' mentioning the assumed name under which the doctor had hitherto communicated with the magazine.

"'I beg to decline giving any information on that subject,' was the response of Mr. Blackwood.

"'If you don't know him, then, sputtered out the stranger; 'perhaps—perhaps you could know your own handwriting,' at the same moment producing a packet of letters from his side pocket. 'You need not deny your correspondence with that gentleman—I am that gentleman.'

"Such was the whimsical introduction of Dr. Maginn to Mr Blackwood; and after a cordial shake of the hand, and a hearty laugh, the pair were in a few minutes up to the elbows in friendship. The doctor remained at this time in Edinburgh, at Mr. B.'s house, for several weeks; and was introduced to Professor Wilson, Mr. Lockhart, R. P. Gillies, Mr. Hamilton, Mr. Howison, and other prominent literary characters, as well as several leading and influential members of the Scottish bar. The doctor remained in Edinburgh until the middle of July, when he returned home,"

(To be continued.)

AUSTRALIA'S FIERCE ANTS.

The biggest and fiercest ants in the world are to be found on the far northern plains of Australia. They build hills as big as houses and fight in the most ferocious fashion. A ghastly incident was reported recently by mail from Australia. A man named James Stanley was pinioned to the ground by a falling tree in northern Queensland. He was immediately attacked by bees and huge green ants. When rescued, his body was covered with them. He died in a few minutes after reaching the nearest hospital.

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

By CHARLES SMITH, M.D.

Æquum est enim meminisse & me, qui discerem hominem esse et vos, qui Judicetis ut fi probabilia dicentur nihil ultra requiratis. Cicero Univers

In Two Volumes.

VOL. I.

The Second Edition, with Additions.

Chapter VI.

The Topography of the Barony of Duhallow, with that of Orrery and Kilmore.

The west of this barony (1) is rough and mountainous, but the rest of it, towards the Blackwater, is very fine land, and abounds with limestone quarries. This country seems to have its name from the river Allo, which Spenser celebrates, by whose charming sights one would imagine that this river rather washed the mountains of Helicon than those of this country. It runs through this barony from the borders ofthe county of Limerick, and falls into the Blackwater below Kanturk, where it is joined by a second river, called Con Dalua, i.e., the double stream; the Allo signifying the echoing river. Over each of them are two fair stone bridges at Kanturk, the arches and battlements being composed of rustic work of hewn stone; that over the Allo consists of six arches.

Kanturk, anciently Keantuirk, i.e., a boar's head, probably from one of those animals having been slain here by some Irish chief in former times. It formerly belonged to a branch of the MacCartys, called MacDonough, who forfeited this estate for aiding the rebels in 1641.

In Queen Elizabeth's time, they erected a most magnificent pile near this place, the walls of which remain entire. It was a parallelogram, being 120 feet in length by 80 in breadth, flanked with four square buildings. This structure was four stories high, and the flankers five; all the window frames, coignes, beltings and battlements were of hewn stone; and the whole made a most grand and regular appearance. This castle was represented to Queen Elizabeth as a place of very dangerous importance to belong to a private subject, and was said to be no less than a strong and regular fortress; upon which the lords of the council of England transmitted an order hither to have the work stopped, so that the finishing of this noble building was prevented, which was one of the finest structures erected by any Irish family that I have seen, and very far from being capable to be made any use of, so as to annoy the Government. Thus it remains still in the same condition, the walls having braved all the injuries of time (2). This castle, with the town and manor of Kanturk, belong at present to the Right Hon. the Earl of Egmont, who has also the title of Viscount from this place. I have mentioned his lordship's titles to this manor in a previous chapter of this volume. The town of Kanturk is in a thriving condition, several well-built houses having been erected in it. Here is a neat market-house, but no church nearer than New-market. It is tolerably well peopled, by persons mostly employed in the worsted manufacture. At Curragh, a little to the north of Kanturk, was a castle of the MacCartys; and near it is a most excellent chalybeate water. The soil in this neighbourhood is a whitish clay; in some places it is yellow, brown, and very deep, producing grass in plenty, but very little tillage, except some barley, oats, and potatoes.

Five measured English miles W. of Kanturk is Newmarket, the last place of any note in the N.W. part of the county. It is adorned with a stately house of Boyle Aldworth, Esq., composed of two regular fronts of hewn stone, which stands on the S.E. side of the town. Newmarket consists of one regular street, and is a considerable thoroughfare into the county of Kerry. In it are some well-looking houses, and a decent parish church. To the W. of this place, on the left hand of the road to Blackwater-bridge, stands Castle Mac-Awliff, formerly the chief seat of that sept; and there is also another of their castles at Carigacushin, a mile N.E. of Newmarket.

The castle of Dromagh stands about three miles S.W. of Kanturk; it was built by the O'Kiefs, and was their chief seat; it is well walled, and flanked by four turrets, and inhabited by Mr. Philpot. Near this place, a vein of coal has been discovered, and considerable quantites have been raised; they are not altogether as bright as the Kilkenny coal, but make a lasting fire, with little or no smoke. They have very good culm which covers the large coal, useful in forges and burning lime. The lands hereabouts are coarse, and afford little tillage.

W. of Dromagh is the parish of Cullen; and near the church are some ruins, said to have been an ancient nunnery, not mentioned in any record. This, and the adjacent parishes, are in the diocese of Aghadoe. In this parish are symptoms of the same coal vein; and in it is the ruined castle of Du Aragil, built by the O'Kiefs. A considerable tract of the county of Kerry, called the East Fractions, is in the centre of this parish. Near the church of Nohavel, which stands on the Blackwater, on the verge of this country, is the stump of a round tower, which, with the church, are dedicated to St. Finian, whose festival is here celebrated on the 13th of December.

Near the Blackwater, at Drumshicane, is a good house of Nicholas Chinnery, Esq. Drumshicane was a fortified castle of the O'Kiefs, with turrets, and an high square tower in the centre, all lately demolished. The walls were built of flat stones or flags, exceedingly well cemented.

On the south side of the Blackwater, in the parish of Clonmene, are a range of mountains, called St. Hillary's, whence several rapid rivulets fall into the Blackwater. Clonmene is a good house of Cornelius O'Callaghan, Esq; near it is the parish church; and more east are the remains of the castle of Clonmene, ruined in the wars of 1641. At Clonmene was anciently, according to Colgan, a monastery of Austin friars, founded by the O'Callaghans. After the wars, Sir Richard Kyle settled at this place; he erected iron works near it, cut down a vast tract of wood in this neighbourhood, and considerably improved the country. When the French threatened to invade the kingdom, in 1666, this Sir Richard Kyle offered Lord Orrery to raise a troop of 60 horse, of which his lordship informed the Duke of Ormond, and says, the world had no better men than Sir Richard had, and that he knew him to be an excellent officer. This estate Sir Richard Kyle sold to Richard Newman, Esq. The mountains here, that were formerly covered with wood, are now generally reclaimed; but where the land was bare of trees, it is for the most part, become boggy and unprofitable. Beneath the turfy sod is a bluish, hard, cold gravel, scarce to be penetrated without much labour. Not far from Clonmene is the hill called Knockinclashy, celebrated for a defeat given to Donough, then Lord Muskery, who, with 4,000 Irish, was marching to raise the siége of Limerick, by the Lord Broghill, with 1,000 English, in July, 1651.

About two miles to the N. of Clonmene is Castle-Magner, which, though in the circuit of this barony, is reckoned to be in Orrery. In the rebellion of 1641, this castle belonged to Richard Magner, agent for the Irish inhabitants of Orrery and Kilmore. When Cromwell was at Clonmel, he went to pay his court to him; but being represented as a very troublesome person, and one who had been very active in the rebellion, Cromwell sent him with a letter to Col. Phaire, then Governor of Cork, in which was an order to execute the bearer. Magner, who suspected foul play, had scarce left Clonmel when he opened the letter, read the contents, and

(1). This barony has 13 parishes, viz. Ballydlough, Kilshannick, Clonmene, Drumtariff, Kilmeene, Cullin, Drishane, Nohavel, Clonfert, Knocktemple, Ballintemple, Kilbrin, and Castlemagner, containing 253 plowlands, and 105,748 acres.

(2). Donogh MacCarty, of Kanturk, was killed by Tyrone in that rebellion, and all his lands, in Duhallow, were seized by his kinsman, Dermod Mac-Owen Carty, who was concerned in aiding Tyrone; Cormac MacCarty, the right heir, being then an infant. But Jan. 24, 1611, he petitioned King James I who restored him to his estate, the lord-deputy Chichester being made judge of the affair.

MSS. Sir Richard Cox, in an old council book.

sealing it up, instead of proceeding towards Cork, turned off to Mallow, and delivered it to the officer who commanded there, telling him Cromwell had ordered him to carry it to Col. Phaire. This officer had often preyed upon Magner's lands, for which he was resolved to be revenged. The officer, suspecting no deceit, went with the letter, which greatly amazed the Governor of Cork, who knew him to be an honest man, and immediately sent an express to Cromwell for further directions. Cromwell, being extremely chagrined to be so served, sent orders to let the officer have his liberty, and to apprehend Magner, who took care to get out of his reach. This castle and lands were granted to the family of Bertridge for 49 arrears; it is now the estate of Sir Standish Hartstonge. Not far from Castlemagner is Knockinoss, where, on the 13th of November, 1647, a battle was fought between the half-starved English, under the Lord Inchiquin, and a numerous army of the Irish, under the Lord Taaf, whereon depended the fate of this province, and where the English obtained a complete victory.

About a mile more east is the castle of Loghort, built in King John's reign; it is in the manor of Kanturk, and belongs to the Right Hon. the Earl of Egmont, whose ancestor, Sir Philip Perceval, placed a garrison in it in the rebellion of 1641. But the Irish gained it by treachery, and held it towards the end of the war, when Sir Hardress Waller, with a battery of cannon, reduced it in May, 1650, and gives it the character of a place of great strength in his letter to the Parliament. This castle remained for many years a melancholy proof of the devastation of those times; but it has been of late repaired by the Earl of Egmont. It is 80 feet high, the walls are ten feet thick, and moated round with a deep trench, which is passed by a drawbridge. In one of the upper chambers is an handsome armoury for 100 horse, well furnished with broad-swords, bayonets, pistols, carbines, &c. Here is also a good library, and other apartments; and from the top of this tower is a noble prospect of a great tract of country.

A mile E. of Loghort is Ballyclough, in the barony of Orrery (a considerable part of the parish being also in Duhallow), a pretty village.

The castle of Ballyclough was built by a family of the Barrys, that went by the name of Mac-Robison; a few years ago there was a chalybeate spaw near this place, in good repute, but it is now neglected, being overflown by an adjacent brook.

Castlecorith, now Castlecor, two miles N. of Loghort, the seat of William Freeman, Esq., is an handsome house, fronted with hewn stone, and flanked at each angle with turrets; and near it is a pleasant park, where are the remains of an ancient fortification, in the midst of which stood a castle of the Barrys.

The parish of Kishanick lies on the S. side of the Blackwater, and in the S.E. part of Duhallow. The castle of Drumaneen stands boldly on the Blackwater; it was the chief seat of the O'Callaghans. About the reign of King James I. they created a very stately house on the foundation of the castle, which was ruined in the late wars. The castle bawn is large, and well enclosed with an high stone wall, flanked with round towers; and the whole, though in ruins, from the opposite side of the river, by its lofty situation, has still an august appearance. In King William's wars, the English kept a garrison in this castle for a considerable time, under the command of Lieut.-Col. Culliford.

Orrery and Kilmore constitute but one barony, formerly named Orriria Barria, the Barrys having had possession of the greatest part of this country. The principal place in this barony is Charleville, before called Rathgogan, a corporation, erected at the expense and encouragement of Roger, the first Earl of Orrery, Lord President of Munster; who here kept his presidential court, and adorned this town with a magnificent house (3), built in 1661, to which he added noble gardens and a fine park. This house was burnt down in the year 1690 by a party of King James's soldiers, with the Duke of Berwick at their head, who, after he had dined in it, left it in a flame. Charleville is governed by a sovereign, two bailiffs, and 12 burgesses. In this town the first Earl of Orrery endowed a celebrated free school, who, although he had great offices and a plentiful estate, yet his soul seemed much larger than his fortune.

Broghill (4), which gives title of Baron to the Right Hon. the Earl of Orrery, is a castle and manor that formerly belonged to the Fitz-Geralds; it stands a little to the W. of Charleville. The castle of Kilbolane, about four miles S.W. of the latter, belonged to the Earls of Desmond; but it is said to have been built soon after the coming over of Strongbow, by the Cogans, from whom the Desmond family had this estate. Castleishin, a mile S.W. of the former, was another seat of the Fitz-Geralds, and Castle-dod, two miles S. of Charleville, also belonged to that family; it is now only a modern built house, and is the estate of the Harrisons. A mile S. by W. from Charleville is Ringfort, a good house and plantation of Mr. Vowell. A mile more to the S. is Mill-town, a well-planted improvement, with an handsome canal of Col. Evans. On this place stood formerly a castle of the Fitz-Gibbons; in the reign of Queen Elizabeth, Maurice Fitz-Gibbon, of Mill-town, slew John Mac-John Fitz-Gerald, of Kilbolane, and 14 of his followers, being assisted by four of his sons, Fitz-Gerald having instigated the Earl of Desmond to hang one of the Fitz-Gibbon family a little before. This castle was, in the rebellion of 1641, bravely defended against the rebels, by one Mountain, who obliged them to raise the siege. The Irish, having no cannon, attacked the gate with an high machine, made of hurdles, carried on wheels, like one of the old Roman towers; but it was burnt by the besieged.

(To be Continued).

(3). The foundation of this house was laid on the 29th of May, 1661. His Lordship, in a letter to the Duke of Ormond (dated the 11th of Dec., 1662) says:—"That he hopes, by his Grace's favour, to get it made a borough, and have it bear the name of Charleville; it being now called by the heathenish name of Rathgogan." His Lordship adds, "I admit neither presbyter, papist, independant, nor, as our proclamation says, and sort of fanatick to plant there, but all good Protestants; and am setting up manufactures of linen and woollen cloths, and all other good trades."

(4). The following is an extract of the King's letter, for creating Roger Boyle, Esq., baron of Brognill, from the original in Lismore Castle:—"Having taken into our gracious consideration the many eminent virtues, and abilities of our right well-beloved cousin Richard Earl of Cork, and his singular good deserving, as well in planting these remote parts of our dominions, with several English colonies, in setting true religion, and introducing civility and government there, where he found barbarians and superstition; and in the erecting of several churches, castles, towns, and other buildings, at his own charges, for the perpetual security of these countries, and our good subjects inhabiting in them; as also in zealously pursuing all good courses, tending to the advancement of our most important services there; and understanding that he hath many younger sons, whom he breeds in true religion and virtuous discipline, thereby making them worthy and profitable members of that State, etc., we do, by these our letters, confer upon his third son Roger Boyle, the honour dignity, stile and title of a baron of that our kingdom; and constitute and ordain him Lord Boyle, baron of Broghill, in that our realm, etc.

"Dated at Westminster, the 30th of Nov,
Anno 3° Carol. prim."

NIMBUS.

All through the slumbrous afternoon the deft
Cloud-builders of the west, beyond a weird
Sky-wall, involved with many a winding cleft,
Their huge white domes have reared.

The whole mid-heaven blends in one burning white,
Like a vast hollow sun: the faint wind sleeps.
When lo! across the world with noiseless flight
The first great shadow sweeps.

Now rising midway 'twixt the north and west,
Above strange leagues of sudden dusk, the wide
Black nimbus, with its turbulent grey crest,
Hangs like a moonless tide.

Before it flies the gale with cool, wet wing.
From foothills of the far blue ridge it comes.
Already may be heard the muttering
Of its dull, stormy drums.

Flash after flash the long, keen lightnings rive
The leaden walls: the torn trees bend with pain.
And now at last the windy rush and drive
Of the fierce tangled rain.

WHY EARTHQUAKES CAN BE PREDICTED.

Doctor Cancani, after a careful study of Italian earthquakes, finds that all such disturbances strong enough to damage buildings, even to a slight extent, are invariably preceded as well as followed by minor shocks. In other words, an earthquake is not an isolated phenomenon, but is one of a series of disturbances. When the depth of the focus of disturbance is small the tremours last about 10 days, when of moderate depth about three months, and when of great depth possibly several years. Professor Omori, in Japan, has arrived at similar conclusions about minor shocks connected with strong earthquakes.

PLANTS THAT PRODUCE INSANITY.

The United States Department of Agriculture is at present investigating the curious behaviour of certain plants growing on the Western prairies which are known as loco-weeds. "Loco" in Spanish signifies crazy. Cattle and other animals feeding upon loco-weeds suffer a derangement of the brain that prevents co-ordinating movements. Several weeds belonging to the bean family are included in this poisonous category. It has been asserted that a single dose of some of these weeds will cause insanity; but Mr. V. K. Chestnut, of the Department of Agriculture, expresses the belief that several days of feeding are required to produce a bad effect.

HELL IN DUBLIN.

I remember instead of turning to the right down Parliament street, going, in my youth, straight forward under the Exchange and up Cork hill, to the old Four Courts, adjoining Christ Church Cathedral. I remember what an immense crowd of cars, carriages, noddies, and sedan-chairs, beset our way as we struggled on between Latouche's and Gleadowe's Banks in Castle street—what a labour it was to urge on our way through Skinner's row—I remember looking up to the old cage-work wooden house that stood at the corner of Castle street and Werburgh street, and wondering why, as it overhung so much, it did not fall down—and then turning down Fishamble street, and approaching the Four Courts, that then existed, through what properly was dominated Christ Church Yard, but which popularly was called HELL. This was certainly a very profane and unseemly souoriquet to give to a place that adjoined a cathedral whose name was Christ Church; and my young mind, when I first entered there, was struck with its unseemliness. Yes; and more especially, when over that arched entrance there was pointed out to me the very image of the devil, carved in oak, and not unlike one of those hideous black figures that are still in Thomas street, hung over Tobacconists' doors. This "locale" of hell, and this representation of his satanic majesty, were famous in those days even beyond the walls of Dublin. I remember well, on returning to my native town after my first visit to Dublin, being asked by all my playfellows, had I been in hell, and had I seen the devil. Its fame even reached Scotland, and Burns, the poet, in his story of "Death and Doctor Hornbook," alludes to it when he says:—

> But this that I am gaun to tell,
> Which lately on a night befell,
> Is just as true as the deil's in hell,
> Or Dublin city.

As hell has not any local habitation in our city, neither has the devil—but I can assure you reader, that there are relics preserved of this very statue to this day; some of it was made into much esteemed snuff-boxes—and I am told there is one antiquarian in our city who possesses the head and horns, and who prizes the relic as the most valuable in his museum. At any rate, hell to me, in those days, was a most attractive place, and often did I go hither, for the yard was full of shops where toys, and fireworks, and kites, and all the playthings that engage the youthful fancy, were exposed for sale. But hell was not only attractive to little boys, but also to bearded men: for here were comfortable lodgings for single men, and I remember reading in a Journal of the day, an advertisement, intimating that there were "To be let, furnished apartments in Hell. N.B.—They are well suited to a lawyer." (!!) Here also were sundry taverns and snuggeries, where the counsellor would cosher with the attorney—where the prebendary and the canon of the cathedral could meet and make merry—here the old stagers, the seniors of the Currans, the Yelvertons, and the Bully Egans, I have above alluded to, would enjoy the concomitants of good fellowship—there Prime Sergeant Malone, dark Phil. Tisdall, and prior still to them, the noted Sir Toby Butler, cracked their jokes and their marrow-bones, toasted away claret and tossed repartee, until they died, as other men die and are forgotten. The characters of Malone and Tisdall are still preserved in Barataniana, and other satirical or serious records of that day. Sir Toby—I question whether he may not have been the prototype, the "eidolon" of Toby Philpot—has his name and his fame, as an astute negotiator, engraven on the treaty of Limerick, and of course he belongs to history; but as a tavern toper I fear he is almost forgotten. His tomb is in St. James's churchyard, and any one who enters that well-peopled cemetery, must observe it as forming the chief ornament of that ugly place. Sir Toby's remains lie mouldering and liquifying there—but, in sooth, if ever ashes deserved to be vitrified, and melted, and cast into a drinking cup, they were those of this old Hibernian lawyer. It is astonishing how these old fellows could do business coolly in the day, who came to it under the effects of the overnight's hot debauch. Doubtless, it did affect them; and I recollect some anecdotes of the same Toby that show the shifts that this old claret guzzler had recourse to:—Sir Toby was engaged in an important cause which required al lhis knowledge and legal acumen (which were not little), to defend, and the attorney, deeply alive to the importance of keeping Sir Toby cool, absolutely insisted upon his taking his corporal oath that he should not drink anything until the cause was decided; and, of course, sooner than lose the retaining fee, the affidavit was made, but kept as follows:—The cause came on—the trial proceeded—the opposite counsel made a masterly, luminous, and powerful impression on the jury—Sir Toby got up, and he was cool—too cool—his courage was not up to the sticking point—his hands trembled—his head was palsied—his tongue faltered—every thing indicated feebleness—whereupon he sent to "mine host" in hell for a bottle of port and a roll, when extracting a portion of the soft of the roll, and filling up the hollow with the liquor, he actually eat the bottle of wine, and recovering his wonted power and ingenuity, he overthrew the adversary's argument, and won the cause. Reader, I am a rambler by profession, allow me, while I have a hold of Sir Toby, and as you may never hear of him again, to recount another anecdote of him, which proves of him that he was as well an honest as

> A thirsty old soul,
> As e'r cracked a bottle, or fathom'd a bowl.

Engaged in a cause where the counsel opposed to him appeared to carry both the feelings and opinion of the jury, he stood up and said, "Gentlemen of the jury—The cause of our antagonist, though plausible, is bad, if there be truth in the old saying 'that good wine needs no bush, or a good cause no bribery'; here, gentlemen of the jury, is what was put into my hand this morning," holding out a purse of gold, "it was given in the hope that it would have bribed me into a lukewarm advocacy of my client's cause. But, gentlemen, here I throw down Achan's wedge—here I cast at your feet the accursed thing"; and so he went on most ably to state his case and defend his cause; and no doubt but the exhibition of the purse had as much weight as the force of his argument in inducing the jury to give a verdict in his favour.

The attorneys of the old Four Courts, and who passed through the palpable hell to gain access to its darker purlieus, were as distinct as the lawyers of the day from those of modern times. I remember, when a youth, being brought into the office of one of the most eminent in Dublin, who dwelt in that then fashionable resort of attorneys, Chancery lane, instead of residing, as now, in some of the squares, as men of ton and elegance—as the rivals of all that is exquisite in taste, virtu, equipage, and horse flesh. Your attorneys of that day was, to be sure, equally keen, equally conscionable in the length and (Reader, pardon the coinage.) Perhaps it may be as well to stick to the single portrait I have alluded to—my uncle's attorney in Chancery lane—he was not a bad or extra specimen of his race. I remember, when ushered into his back parlour, which served him for office, dressing-room, eating-room, and, I believe, sometimes sleeping-room, what a dusty, dingy, dark, fœtid hole it was. The man was not out of keeping with his domicile—he looked like a great bloated spider in the centre of his cobweb. I have him before my mind's eye, as he waddled off his triangular chair to salute us; his snuff-stained, cadaverous face overhung by a brown scratch wig that stuck awry on his head, and seemed to have grown too small for his cranium; his natural black hair thrusting itself out over his left ear, and hanging extravagantly from his poll behind; his abdomen immensely protuberant, and as his inexpressibles scorned the aid of suspenders to keep them up, they fell apart from his waistcoat, and leaving a goodly share of not quite clean linen to be seen, they hung in loose folds about his thighs, and caused the corduroy of which they were composed, to whistle as he waddled about the chamber. His accent was in the rich broad brogue of the county of Limerick; and nothing could exceed the familiar, gossipping, flattering, slewdering fondness, which he complimented my uncle, who was one of his oldest clients. I have reason to remember Tim —— well; the best part of my worthy relative's property passed into his hands instead of mine, in liquidation of his tremendous volume of a bill hell, and under the encouraging presence of his satanic majesty, I do not remember.

AN INTERESTING TRIBE.

In the annual report of the Bureau of American Ethnology an interesting account is given of the folk lore and traditions of North American Indians, some of which are remarkably quaint. The customs and superstitions of the Navalio Indians, who occupy a reservation of more than 11,000 square miles in the north-eastern part of Arizona and north-western corner of New Mexico, are especially peculiar. Though they still retain their pastoral habits they are slowly developing into an agricultural tribe. They live in hogans or houses of two kinds, one built for the winter and the other for summer. The winter hogans resemble mere mounds of earth hollowed out, and although of rough appearance their builders conform not only to custom but to what amounts to ritual in their construction, with inaugural ceremonies of the most elaborate character. There is no attempt at decoration; a framework is formed of interlocked forked timbers to which are added stout poles for the sides, and the whole is covered with bark and earth. A hogan can usually, with the help of neighbours, be finished in one day, and then begins its dedication. First the good wife sweeps the new house, and the fire is kindled under the smoke hole, when the head of the family comes in and after rubbing a handful of dry meal on the principal timbers and strewing some on the floor, chants a peculiar invocation, asking the gods that evening connected with his home may be delightful.

The Navalio have a tradition that they were taught house building by the God of Dawn, while to the tribes of the plain were given the skin lodges and to the pueblo stone houses. When First-man and First-woman were living in lowest Under-world, their dwelling was a prototype of the present hogan, but instead of a covering of bark and earth its poles were wrapped in a film of sunbeams and rainbows. This Under-world was people by monsters who also lived in huts built after the same fashion, but of different materials. In the east dwelt Tiehoil-hodi in a house of cloud, with thunder guarding his door, while in the south sat the Frog in a dwelling of blue mist. The western mirage afforded a home for the Salt-woman, before whose door the Water-sprinkler dances, and towards the north the Blue Heron built himself a hogan of green weed, with the Tortoise as his gate-porter. When by the power of the Magic Reed manking ascended to the present or fourth world the Dawn god taught them the methods of building best fitted for their several conditions. The hogan is, however, regarded merely as a temporary residence, for when a Navalio dies the beams are pulled down over the corpse, while the remainder is usually set on fire, and the ruin henceforth becomes "tabu" to the bride.

LITERARY NOTES.

Lady Mary Milbanke, Byron's great-grand-daughter, will make a first appearance with a little book of verses, entitled "Fair Children," to be published by Messrs. Burns and Oates.

✧ ✧ ✧

"Sarah Grand" has been busy of late preparing material for a new book, but it will not see the light for some time. "Sarah Grand" is not an author who turns out books quickly. The actual writing of "The Heavenly Twins" occupied her for two years.

✧ ✧ ✧

Mr. Bryce's new book, promised shortly by Messrs. Macmillan, will be one of the features of the present publishing season. "Biographical sketches" of Mr. Gladstone, Lord Beaconsfield, Dean Bradley, and other of the great men of the century with whom the author was intimately acquainted, promise a volume of quite unusual interest.

✧ ✧ ✧

When the relations of and friendship between William I. of Germany and Prince Bismarck are remembered, the correspondence between these two notable history-makers which Mr. Heinemann will issue next month is sure to form entertaining as well as illuminative reading. The "Correspondence," which will extend to two volumes, will include some letters besides those of William I. to and from Bismarck.

✧ ✧ ✧

Mr. E. T. Cook has for some time past been hard at work on the Library edition of the works of John Ruskin, which he is editing in conjunction with one of Ruskin's literary executors, Mr. Alexander Wedderburn. The first volume will be ready towards the end of the present month. The edition will be complete, and is the first uniform edition of Ruskin's works that has been published. Each volume will be prefaced by an introduction, bibliographical and biographical. In the preparation of the edition much new matter has been placed at the disposal of the editors.

✧ ✧ ✧

All the illustrations inserted by Ruskin in his books and all drawings by him which have hitherto been published will be included. Where possible the original plates will be used. This edition will give a large number of the author's drawings which have not hitherto appeared, as well as numerous hitherto unpublished plates engraved under his personal superintendence. Some of the best portraits of Mr. Ruskin will be inserted as frontispieces. The order of the volumes will, as far as possible, be chronological. The edition, which it is expected will run to about thirty-two volumes, will be strictly limited to 2,000 copies

✧ ✧ ✧

Since the first issue of "John Inglesant" to the public by the printing of 750 copies in 1881 the work has run into many editions, and it is computed that at least a hundred thousand copies have been circulated. Some two years ago a sixpenny edition was published, and in the end of last year there appeared a limited edition de luxe of the romance in three volumes, with a photogravure portrait of the author. Mr. Shorthouse's less known works are, "Sir Percival," "Little Schoolmaster Mark," "The Countess Eve," "A Teacher of the Violin," "Blanche, Lady Falaise," and "On the Platonism of Wordsworth," a paper read to the Wordsworth Society.

✧ ✧ ✧

Mr. Sidney Lee has been warmly welcomed in the United States. The Lowell Lectures, which he delivered at Boston during last month, in spite of very wintry weather, the "Athenæum" says, attracted crowded and enthusiastic audiences throughout. He also met with very gratifying receptions during February at Harvard and Yale Universities, at Wellesley College for women, and at Brown University, Providence. He has received numerous invitations to extend his tour both in the south and west of the continent far beyond the basis that he arranged before his departure. Although he hopes to be able to enlarge his itinerary somewhat in both directions, he does not propose to change his original plan of returning home by the end of May.

✧ ✧ ✧

Nothing that Bret Harte ever wrote had the vogue of his "Heathen Chinee," yet it is stated in the biography of the author by Mr. T. Edgar-Pemberton that in San Francisco, where the poem should have been at once understood and appreciated, it attracted little or no attention. In other parts of the country the verses when reprinted were hailed with delight, and on reaching these countries the chorus of delight was augmented. Indeed, Mr. Pemberton says that it was "The Heathen Chinee" that clenched the growing popularity of Bret Harte's works in England.

✧ ✧ ✧

Bret Harte, however, seemed always to deplore the extraordinary interest the verses excited, and he sometimes made half-humorous, half-earnest protest against the constancy with which it was quoted in the newspapers. Mr. Pemberton tells a story in this connection:—

Soon after Bret Harte's first arrival in London his acquaintance was sought by a certain noble lord of high literary reputation, and he was invited to dine at the great man's house. Always anxious to escape being lionised, he told a friend, who was to be of the party, that he should not go if her thought "The Heathen Chinee" would be quoted at table. The well-meaning friend sent a note of warning to their host; but his lordship loved a joke, and, giving his other guests a hint, they talked "Heathen Chinee" and nothing else! At first perplexed and annoyed, Bret Harte soon saw through the little plot, and heartily joined in the laugh he had helped to raise against himself.

The author, when challenged on the subject on one occasion, admitted that his metre was suggested by the threnody in Swinburne's "Atalanta in Calydon."

✧ ✧ ✧

There appear regularly in certain weekly journals advertisements for scarce books, 25s each being offered. That such advertisers are persistent proves that ignorance is widespread as to the approximate value of literary rarities. Of many books for which 25s is at this moment being offered, mention may be made, for instance, of the editio princeps of Fitzgerald's "Omar Khayyam," of 1859, which, if in good state, would at auction fetch £40 or £50. It is a great question whether journals of standing should accept such advertisements, well knowing what they are, and the loss involved to those who fall into the snare. For those who do not know the approximate value of a book, the safer plan is to consult a trustworthy expert or to send it to a reputable auctioneer of literary property in London. For instance, the copy of Scott's "Tales of my Landlord," which on Thursday realised £30 10s at Messrs. Hodgson's, was deemed by the owner to be worth no more than about £2. Had it been perfect, the work would probably have fetched £50.

✧ ✧ ✧

Maxim Gorky's latest play, "At the Bottom," experimentally produced in Moscow, was a great success. It deals with the dregs of the lodging-house and the street, and the regeneration of certain of the characters by means of the simple and loving humanity of an old ex-Siberian convict. The Moscow "Slovo" said of the play:—

This drama is a song; it is a hymn to humanity. It is awful and joyful. Seeing at the bottom decaying, abandoned people, you say to your conscience: "They are already dead: they no longer feel." And you are reconciled, at peace, whatever may happen to them.

But suddenly you retreat in horror. They are still alive!

A marvellous spectacle of indescribable beauty presents itself to our eyes. Beneath the mire, beneath filth, ugliness, vice, loathsomeness, horror, in a lodging-house, among the dregs—the human personality still lives!

✧ ✧ ✧

Mr. Andrew Lang has been writing in the "Morning Post" on the subject of circulating libraries. Mr. Lang says—"The more you look, with a mind disengaged, at the mystery of circulating libraries, the more you perceive its roots extending into darkness and infinity, and understand that it has relations co-extensive with the universe." So it has, on general principles, but Mr. Lang, in common with many of us, has found it, in the country at least, of no practical value. Novels you can get by the score, but they are generally the "amateur drivel" which Mr. Lang presumes to have "an eternal attraction." Books which are not novels are to seek. You may ask for them, but you never get them. Mr. Lang concludes:—

Judicious book-buying on the side of the public would be, at least to some people, the most agreeable solution of the problem of how to get books. Unfortunately, the whole house would not contain the books that should be purchased. "The peety is that, in this world, as God made it, ye canna hae a' things as ye would want them," says a philosopher in one of Mr. Stevenson's works. On this general conclusion the wearied intellect courts repose. And yet the ingenuity of man, if man will only exert his ingenuity, may yet find a way of improving lending libraries.

We doubt whether the ingenuity of man will ever attain such heights. The country circulating library does not exist for book lovers.

✧ ✧ ✧

The "Letters to a Literary Aspirant" are continued in the current "Blackwood." The engaging uncle who advises his nephew deals with various forms of fiction, including the realistic:—

Realism attends to the ash-buckets, the smell of the fried-eel reservoirs, the bottle-nosed loafer propped up against the wall.

And what would stick in your memory when you came in? Surely the two or three unexpected encounters, the incident that was a little different from other incidents.

Realism remembers the number of lamp-posts passed, the pattern of the pavement flags, the specks of the everyday dust floating in the air.

And it is this that realism calls a picture of life. Hence the necessity for a special course of preparation before handling its delicate tools. The reiteration of the unimportant and the obliteration of the picturesque are the two aims you must keep steadily before your eye.

It all depends, of course, upon what is meant by realism. But "the reiteration of the unimportant and the obliteration of the picturesque" hits off skilfully certain forms of pseudo-realism. The word has come to have a narrow and arbitrary meaning for which it is rather difficult to account. There is a realism of beauty as well as of ugliness.

✧ ✧ ✧

From "The Point of View" in "Scribner's Magazine" we extract the following:—

I heard the question brought up, the other day: "Why is it that a description of a painting, couched in terms of music, or of a musical composition, couched in visual terms, is so much more vivid and forceful than a description expressed in terms of the particular art with which it has specially to do?" Why, for instance, do such expressions as "an orchestra of colours," or "a flower-bed of tones," appeal so awakeningly to the imagination?

"Of the truth of the statement," says the writer, "there can be no doubt." There is, however, every doubt (says the "Academy"), no writer of any real literary sense could use such a metaphor as "an orchestra of colours." The writer says later: "Your image must be not only apposite, but startling; it must compel the attention." That is a dangerous saying. From its application proceed those terrifying stridences which make a reviewer's life unhappy.

SCIENTIFIC TOPICS.

The exhibition of relics shown during the recent birthday celebration at Bath was largely attended, and included articles from Ipswich and the "Leather Bottle" at Cobham. Possibly the forthcoming exhibition is to include these articles on their way home. There is a peculiar appropriateness in the site of the exhibition, seeing that the Memorial Hall marks the place where Mr. Pickwick and Sam Weller were detained in the Fleet Prison.

✧ ✧ ✧

So far as North American snakes are concerned, nearly all those whose scales on the under side, from the vent backwards, extend in one row across the body are poisonous; whereas, those which have a dividing (median) line, and a row of scales on each side of it, are non-poisonous. In North America, omitting Mexico, there are about one hundred and sixty-five species of snakes, of which some twenty (counting the several kinds of rattlesnakes) are venemous. These include the Elpids, or Coral Snakes; the Copperhead (Agkistrodon contortrix); the Water Moccasin (Agkistrodon piscivorus); two species of Sistrurus (Sistrurus miliarium or Ground Rattler, and Sistrurus catenatus or Massasauga); and a number of species of Rattlesnake (Crotalusl), such as the Dog-faced Rattlesnake (Crotalus molossus), the Banded Rattlesnake (Crotalus horridus), the Diamond Rattlesnake (Crotalus adamanteus), the Texas Rattlesnake (Crotalus atrox), the Red Diamond Rattlesnake (Crotalus atrox ruber), the Pacific Rattlesnake (Crotalus lucifer), the Tiger Rattlesnake (Crotalus tigris), the Horned Rattlesnake (Crotalus lepidus), the White Rattlesnake (Crotalus mitchellii), the Red Rattlesnake (Crotalus mitchellii pyrrhus), and Price's Rattlesnake (Crotalus prieei).

✧ ✧ ✧

The Coral snakes are very retiring in their habits, and are possessed of a gentle and amiable temperament, but when greatly provoked they can inflict a bite much more venomous than that of a rattlesnake or moccasin of the same size. Apart from the Coral snakes, all other North American venomous snakes may be classed under the name of Pit Vipers or Crotalids. The word "pit" relates to the deep depression found in rattlesnakes, copperheads, and moccasins on both sides of the face between the nostril and the eye. Furthermore, this characteristic applies only to the Crotalids, and its presence at once places the serpent in the "dangerous" category.

✧ ✧ ✧

The Copperhead, also known in different localities by the names Upland Moccasin, Chunkhead, Deaf Adder, Pilot Snake, etc, is, perhaps, to be more dreaded than any other American snake. Not having a rattle, it cannot sound an alarm, even if it wanted to, and its danger is increased by the fact that its movements are rapid—much more so than those of the rattlesnake, than which it is also much more aggressive. There is some comfort in the assurance that its poison, in proportion to the quantity, is less virulent, and its bite less dangerous than that of the Rattlesnake. The body of the Copperhead, which species seldom exceeds three feet in length, is strong and thick, ending in a short tail provided underneath with a row of shields. The colour of the upper parts is a beautiful coppery brown, becoming lighter on the sides, with dark-brown spots of a characteristic hourglass-shaped form. It generally inhabits low ground and is found from the 45th parallel of north latitude to the extreme south of the eastern United States. It produces its young alive, like all other crotalids, the average number of the members of a family ranking from seven to nine.

✧ ✧ ✧

The Water Moccasin (Agkistrodon piscivorus), which seldom exceeds four feet in length, is a very venomous snake, and is more to be dreaded than the Rattlesnake, as it will attack anything and everything on sight, and without apparent provocation. With its mouth wide open it erects itself boldly and darts forward with a rapid spring. Its colour is a greenish brown, and it may be recognised by a number of dark bands somewhat similar to those of the Copperhead. Its range extends southward from North Carolina; over the whole of North America, and westward as far as the Rocky Mountains. This serpent is especially plentiful near rivers, marshes, and in swampy lands. According to one authority it delights in climbing trees—apparently for the pleasure of basking in the sun. It is reported that some specimens in the Zoological Garden in Berlin became very tame and gentle towards their keeper, who finally handled them without fear. They would take their food—fishes or even raw meat—from the forceps held in his hand. Toward other snakes they were very savage, and it is stated that their bite is dangerous to other poisonous snakes, although not injurious to others of the same species.

✧ ✧ ✧

Most conspicuous among the Pit Vipers (Crotalids), which are common to Asia and America, are the dreaded Rattlesnakes. These latter, however, are confined to America. They are distinguished by the jointed, horny appendage at the end of the tail, commonly known as the "rattle." In young specimens the tail ends in a simple "button," which is the last joint of the tail. By the time the snake has reached maturity, twenty or more rings may have been interpolated between it and the scaly portion of the tail.

✧ ✧ ✧

The Niagara Falls Power Company suffered from a very remarkable disaster on the night of Thursday, January 29, when lightning struck the cables in the covered bridge that connects the generating station with the transformer house. The bridge is a stone structure, having a slate roof, and crosses the inlet canal. At one end of it stands power house No. 1, in which 50,000 horsepower is generated at a voltage of 2,200. The greater portion of this vast amount of current is conducted by the cables of 1,000,000 cm. capacity across the bridge to the transformer station. The bolt of lightning that came out of the January sky shortcircuited the cables on the bridge, and fire started. Before it was extinguished the interior of the bridge and transformer station, as well as the roof of both, had been badly damaged, while the cable connections across the bridge were totally destroyed. Water thrown into the transformer station by the firemen wet several of the huge transformers, and these were useless until dried out.

✧ ✧ ✧

The destruction of the cables on the bridge caused no end of trouble, for it made impossible the distribution of the 50,000 horse-power of the station, with the exception of the rotary service supply to the local electric lines, the arc light station, and the Natural Food Company. None of the generators were injured. However, the electric power supply of several of the tenants of the Power Company's lands, as well as that of the Buffalo and Niagara Falls Electric line, the Lockport-Buffalo line, and of industrial establishments in the Tonawandas, Lockport, and Buffalo, was wholly cut off. All the Niagara power sent to Buffalo passed across the cables on the burned bridge, in order that its voltage might be raised in the transformer station, and Buffalo was without Niagara power for its lighting and trolley service. It would have been hard to find a more vital point at which to attack this great and wonderful generating station. For a brief time the machines in both of the big power-houses were shut down, but as soon as it was found to be possible, which was within an hour or so, the local trolley and lighting services were renewed.

✧ ✧ ✧

While several of the industrial establishments at Niagara Falls were forced to shut down, the Buffalo and Lockport public fared much worse than Niagara Falls, because in Buffalo Niagara power enters into the lighting to a great extent, while the energy of Niagara is also used for the operation of the Buffalo and Lockport trolleys. All the Buffalo manufacturing establishments that have come to use Niagara power remained idle on Friday; the day following the Niagara fire, as did also several in the Tonawandas. Lockport was also seriously inconvenienced. In Buffalo many of the papers use Niagara power in the operation of their presses, and its absence forced them to take their forms to other establishments that had a source of power. In Buffalo the International Traction Company greatly cut down the number of cars operated. Its storage battery and steam plant were brought into service.

✧ ✧ ✧

The scene of the fire had not had time to cool ere the repair work was in progress. Night and day the men worked under the watchful inspection of Superintendent Barton. By noon on Friday the company was prepared to send 10,000 horse-power to Buffalo, but as this was about to be sent out a short circuit occurred, delaying the transmission until about 4.30 p.m. Later an additional 5,000 horse-power was furnished Buffalo. By Saturday afternoon things were quite normal about the big power plants, and all but one of the local tenants of the Power Company were in the enjoyment of a power supply. Of course, all the effects of the disaster had not been eradicated, but the temporary cable installations gave all desired service, and work went on in the plants that had been idle.

✧ ✧ ✧

Some time ago Professor Darwin, of Cambridge, pointed out that, if a star revolved on its axis with a certain velocity, the star would tend to divide into two, and the form it would take before complete separation would be that of a dumbbell, or rather two pears joined top on top. This deduction was purely theoretical. During the past two years an examination of the light changes of some recently discovered variable rays reveals this very condition of things. For example, a star in the Southern sky goes through a certain regular series of light changes in seven hours, indicating that the star is a twin system, the two bodies composing it being in contact. This dumbbell system revolves upon the common centre in seven hours. There is another variable star in the Southern sky the light changes of which show that the two stars composing the system are no longer in contact. Separation has just taken place, the nexus between them is broken, and two worlds, full-born, have started on that outward spiral which in the course of ages will carry them far from one another.

✧ ✧ ✧

An exceedingly valuable property of aluminum has recently been discovered, which consists in its application as a whetting agent, the effect produced on cutlery set with it being most astonishing. Though a metal, aluminum possesses the structure of a fine stone, has a strong dissolving power, and develops upon use for honing, an exceedingly fine metal setting substance of greasy feel, while showing great adhesion to steel. The knives, etc., treated with it quickly obtain such a fine, razor-like edge that even the best whet stone cannot produce a like result. Thus knives which had been carefully set on a whet stone, when magnified a thousand times, still exhibited irregularities and roughness in the edge, while the edge of knives sharpened on aliminum, upon exactly the same magnification, appeared as a straight, smooth line.

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

DUBLIN, FRIDAY, OCTOBER 5.

Tuesday night, a farmer's house near Blessington, was attempted by a gang of robbers, who had already taken down a window shutter, and were on the point of breaking the glass, when twelve labourers, who lay in an adjoining barn, overheard their manœuvres, and sallied out in a body with pitchforks, spades, reaping-hooks, and such weapons as came to hand, which, with a loud scream, little less terrifying than an Indian war-whoop, so intimidated the villains, that they fled with the utmost precipitation, except one who fell, and was immediately stabbed by a pursuer, and soon after expired.

As the villains who have for some time lurked around the Circular road, may soon be expected to pay their compliments in Camden and Charlotte streets, the inhabitants have wisely instituted a patrol of several stout men, armed with muskets and bayonets, and furnished them with a bell, which hangs from their belts. They are not stationary, but walk from the corner of Cuffe street to the turnstile leading to Ranelagh, in such order as to succeed each other every fifteen minutes, by which regulation, neither time, space, or opportunity is given for any acts of depredation or insults. We seriously recommend the same salutary mode to the rest of our genteel environs.

DUBLIN, SATURDAY, OCTOBER 6.

Orders have been received at Cork within the course of these few days, for a very considerable quantity of provisions, which are to be got ready with all possible expedition, and shipped off for the victualling yards at Portsmouth and Plymouth.

Last Sunday a tumultuous and outrageous mob broke into the Gaol of Loughrea, in the county of Galway, and rescued thereout two men under a rule of transportation, as also several felons confined therein for various offences. An association for apprehending and prosecuting the rioters, has, we hear, been entered into by the gentlemen in that neighbourhood, in consequence of which it is hoped these nefarious offenders will be brought to justice.

On Monday last commenced the races of Lucan, which continued with propriety till Thursday, when it was found indispensibly necessary, on account of some rioting that day, for Magistracy to interfere; the High Sheriff of that county attended by a strong guard, went out to that place yesterday, and had the tents struck to prevent any further riot or disorder which might have otherwise happened.

That there is a radical fault in lighting this city (probably owing to the quality of the oil) no one can deny; for although the Commissioners have done everything in their power, yet (except the leading streets) the town experiences almost perpetual darkness. We pay an equal tax, and why should not we be as well lighted as London?

Wednesday last, at the Quarter Sessions at The Tholsel, before Denis George, Esq., Recorder, Anne Codd was found guilty of stripping the child of Mr. Michael Smith to the very shirt, and sentenced to be whipped from the Chapel in Stephen street to the corner of Back lane, this day, to be confined six months, and to give two sureties, in £25 each, for her future good behaviour. Bridget O'Brien, found guilty of felony, was ordered to be burned in the hand, and confined eight months. And James Caffrey, found guilty also of felony, was ordered to be whipped three times round the New Prison on Saturday, the 6th of November.

The two Goffs, who some ago were tried at the Commission for killing the sheep of Mr. Byrne, as also some sheep the property of the Right Hon. the Attorney-General, and acquitted, were tried for killing two sheep, convicted, and had sentence passed upon them accordingly. Patrick Moulds was tried and convicted of stealing a cow, the property of Mr. Jones, and recommended as an object of mercy by the petit jury. Until there is an active exertion on the side of justice, in hanging up all the felons returned from transportation, we shall have no end to constant robbing. Those experienced villains, hardened in iniquity, are prompt to head any gang; and knowing every avenue of escape, it cannot be a surprise that so few of them are detected.

CORK, OCTOBER 1.

Early on Saturday morning the Whiteboys assembled and cropped 27 horses in the parish of Grenagh, belonging to persons who took their tithes.

LIMERICK OCTOBER 4.

Much has been said in the public prints to stimulate the nobility and gentry of Ireland to act with humane attention to their tenantry; we are happy to find that our countryman, the Right Hon. the Attorney-General, stands foremost in the list of good landlords; since he came to the country, he not oly remitted rents to the deserving, but gave large sums to his improving tenants, and renewed several leases that had nearly expired. This is the example worthy of imitation by all our great men, which must make them ear to their dependents, and a real benefit to their country.

DUBLIN, MONDAY, OCTOBER 8.

The house of a poor man, who farms a dairy from a Mr. Landy, between Balbriggan and Balrothery, was broke open by a gang of villains on Thursday night last, who tied all the family hand and foot, and plundered the house of a quantity of cash, with every article of value they could conveniently carry. They got clear off; but every exertion is making in the neighbourhood for their apprehension.

DUBLIN, TUESDAY, OCTOBER 9, 1787.

Wilde, who was hanged yesterday at Kilmainham-common, pursuant to his sentence, for stopping and cutting Mr. Gunning, with intent to rob him; at the place of execution made ample confession of the many enormities he had committed; and declared, that if the blunderbuss had gone off, he certainly would have shot the persons he attacked. When cut down, a number of fellows laid hold of the body, and carried it without a coffin, or any other covering, along the Circular road, where they several times attempted to restore him to life, by rubbing his limbs, and trying every other method their sagacity could suggest.

The Dublin Society, it has been often remarked was the first public institution of the kind for the improvement of agriculture and manufactures. To the labours of this society we may attribute in a great measure, the great and useful improvement and extension of tillage in this country, and by them our manufactures, if not forwarded as much as could be wished, were certainly kept alive in the country. It is, therefore, with great pleasure we hear of the establishment of another society on the most liberal principles, the members of which are establishing a Museum for the display and encouragement of the fine arts, mechanics, and manufactures; where all meritorious productions in those branches will, free of any expense to exhibitor or visitor, be submitted to the public inspection, by a perpetual exhibition in a most pleasing style, and in a manner entirely new (there being nothing of this kind as yet in Europe).

CORK, OCTOBER 8.

The riotous spirit of the common people has arisen to a height really alarming, and calls for the active exertions of every gentleman of property and influence. On Sunday evening last, the 30th of September, a disorderly mob assembled at the village of Ring, near Clonakilty, whose numbers could not be less than 1,100, for the purpose, as was given out, of exercising their military skill in a pitched battle between two factious parties. The combat was with difficulty prevented by the Rev. Mr. Townsend, who on receiving information thereof, repaired to the place with a small part of the army and the Police-constables. Several gentlemen of the neighbourhood contributed their ready assistance to suppress the riot; among whom are particularly distinguished Mr. William Moore, Mr. Charles M'Carthy, of Ring; and Mr. Timothy Deasy, jun. It was near midnight before the crowd was quite dispersed.

DUBLIN, THURSDAY, OCTOBER 11.

The inhabitnats of this metropolis are, as well as of the kingdom in general, are highly indebted to Lord Ranelagh, for forwarding the great national work, the improvement of the harbour of Dublin, so as to render it safe and commodious for the shipping of all nations. The wall has been carried to an amazing length, considering the shortness of the time; many dangerous sand-banks are removed, and other necessary alterations effected with such judicious attention and spirited activity,, as reflects high honour on his Lordship and those gentlemen connected in the management of this important business, but particularly to the noble Lord who acts as Commissioner without fee or reward.

On Saturday night last the Right Hon. the Lord Mayor visited several of the public markets, and sent to the City Marshalsea twenty-six penny loaves, seized by his Lordship in his perambulations through this city, as being deficient in weight.

Yesterday our active Chief Magistrate fined a baker the sum of £1 19s. 6d. for having a quantity of light bread in his shop; and we are happy to hear that his Lordship has declared his fixed determination to punish with the utmost severity those harpies who daily add to their accumulated hoards of ill-got pelf by grinding the face of the poor. His Lordship's humane attention in this particular cannot fail to produce the most desirable consequence, and must raise him high in the estimation of his fellow-citizens.

Tuesday a number of felons, of both sexes, under a rule of transportation, arrived in this city from different county gaols, and were conveyed to the New Prison, where they are to remain until sent to his Majesty's plantations the first opportunity.

If the police persist in their exertions, there is not a doubt but the roads leading to this city will soon be cleared of the number of villains who have for some time infested them, and committed their depredations on the public. Monday morning early a party of the horse set off for Rush, and apprehended two notorious robbers, whom the safely conducted to town, and lodged in Kilmainham Gaol.

(To be Continued.)

RATES OF SUBSCRIPTION.

"DUBLIN PENNY JOURNAL."

Post free to any part of Ireland, Great Britain, Australia, New Zealand, Canada, United States.

Twelve months, 6s 6d; Six months, 3s 3d; Three months 1s 8d.

Printed and published for the proprietors at 90 Middle Abbey street, Dublin, by W. F. Dennehy, to whom all cheques and money orders should be made payeble.

Dublin Penny Journal

A Magazine of Art. Archæology, Literature, and Science

Vol. I., No. 52. DUBLIN, SATURDAY, MARCH 28, 1903. PRICE ONE PENNY.

CASTLEDERMOT ABBEY,

COUNTY KILDARE.

(FROM THE "ANTHOLOGIA HIBERNICA," 1793.)

CASTLEDERMOT, CO. KILDARE.

(From "Anthologica Hibernica," October, 1793.)

Castledermot is situated in the barony of Kilkee and Moon, and though now only a village was a place of considerable strength, surrounded by a wall with four gates. The fabulous Legend informs us, St. Diermit, about the year 500, founded a priory of regular Canons here, when it was named Disart Diarmuda; whence it received the appellation of Tristledermot, which it enjoyed for some ages, is not easy to conjecture. In the 9th century it was plundered by the Danes, at which time there was a celebrated school here, in which was educated Cormac, Bishop of Cashel, and who, on his decease in 907 or 908, was interred in this priory. In this age or the next, the round tower, old church, and the crosses seem to have been erected, as they bear evident marks of belonging to these times.

Strongbow, Earl of Pembroke, bestowed on the soldiers who followed him into Ireland large possessions. To Walter de Riddlesford he gave the lands of Murthy and Imayle, in which Castledermot stands, being the ancient patrimony of the O'Tohills or Tools. The third Lord Offaley, marrying the daughter and heir of Riddlesford, became possessed of Castledermot and his other lands, and erected a castle in the town. In 1264, Richard de Rupella, Lord Justice of Ireland, together with Lord Theobald Butler, and Lord John Cogan, were taken prisoners by Maurice Fitz Gerald and Maurice Fitz Maurice, as was the Red Earl of Ulster. The Burkes and Geraldines quarrelled about some land in Connaught, and filled the whole kingdom with war and tumult. A meeting was appointed at Castledermot, when the foregoing outrage was committed, and the prisoners sent to Fitz Gerald's castle of Ley.

In 1302, Thomas, Lord Offaly, founded a monastery for conventual Franciscans in Castledermot, to which the family of Delahoide were great benefactors.

In 1315, Roger Mortimer opposed Bruce, the Scottish invader: a battle was fought at Kells, in Meath: Bruce was victorious, over-ran the country, and took Castledermot, and the next year spoiled the town. Just before this, the Lord Justice made a great slaughter of the rebels at Tristledermot, who had risen against the Government while deeply engaged with Bruce. The latter, after destroying the Franciscan convent in Castledermot, and taking away the books, vestments, and all the ornaments of the church, with the most impious and sacrilegious violence,

was entirely defeated by Lord Edmond Botiller near the town.

In 1328, Thomas, the second Earl of Kildare, died: he built St. Mary's chapel in the convent, and was interred in it, together with his wife Joan, daughter of Richard, Earl of Ulster. In 1414, the Irish rebelled in Leinster; Thomas Crawley, Archbishop of Dublin, and Lord Justice, advanced as far as Castledermot to oppose them.. He continued there with l 's clergy in prayer for their success; the event was answerable to their wishes, for the enemy were defeated with the loss of an hundred men at Kilkea.

A Parliament was held at Castledermot in 1499, on the 26th of August, which granted to the King an impost of twelve pence per pound upon all merchandise imported to be sold, wine and oil excepted. Orders were also made that the nobility should ride on saddles, according to the English fash'on, and should wear their robes in Parliament, and both clergy and laity give the King a subsidy.

In 1532, Gerald, the ninth Earl of Kildare, rebelled, and after destroying the county of Kilkenny with fire and sword, plundered the people of Castledermot, on a fair day, and killed many of them. During the rebellion of 1641, Castledermot was alternately in the hands of opposite parties; in 1650 it was taken by Colonels Reynolds and Hewson. From that time its walls have mouldered to decay, so that now not a vestige remains. The castle and some parts of the monasteries still exist. It has six annual fairs, but no market. The number of houses in 1793 was 163; sixty-three were of lime and stone and slated, the rest cabins. It has no manufactures, and is principally supported by the great post road running through it from Dublin to Cork. The round tower is still used as a belfry, no weak proof of its original designation.. The arch of this tower is semicircular, and seems to have been adorned with the chevron moulding.

NOTES AND QUERIES.

A WELLINGTON SOUVENIR.

TO THE EDITOR DUBLIN PENNY JOURNAL.

Anselm writes:—I have lately seen a curious coin which was found in the wall of an old building. It is a shade broader than a penny, has stamped on its face the head of the Duke of Wellington, with the words, "Wellington and Erin Go Bragh," and date "1814." On the reverse side is the Irish harp, surmounted by a crown, and the words "Stephen's Green, Dublin." What was the object for which such a curious medal or coin (it has more the appearance of the latter than anything else) was struck?

TO THE EDITOR DUBLIN PENNY JOURNAL.

CUNNINGHAM—Mortogh Cunningham rented the lands of Killeen, in Barony of Cashlea, Co. Limerick, about 400 acres, from Lord Kingston, in the year 1725. He died about six years later. His wife's name was Prudentia, and he had children. Have any of your readers any knowledge of him?

R. S. C.

DR. MAGINN.

A FAMOUS IRISH LITERATEUR OF THE LAST CENTURY

PERSONAL RECOLLECTIONS.

By the late Dr. Kenealy, Counsel for the Tichborne Claimant.

II.

From this time until 1828, the doctor constantly contributed to "Blackwood," and the list of his works now lying before us is such as probably no other literary man in the empire could have equalled. In the year 1823, he married; and having giving up his school, went to London, with the intention of seeking his fortune in the wide ocean of literature, dreaming, no doubt, like most young men, of the golden isles of Atalantis, to be found in those watery wilds, and like them doomed to disappointment. His celebrity soon procured him literary employment; and from Murray, "the Anax of booksellers," as Lord Byron called him, he received overtures for the composition of a life of that poet, who had just died. Nothing can more clearly show the high opinion entertained by those best qualified to judge of his abilities than this fact. A young man from an Irish provincial town, who had never written a book, and whose name was little known, entrusted with the biography of one of the greatest of England's poets, by one of the shrewdest booksellers that ever lived, is a spectacle not often seen, and Maginn used to speak of it with no little satisfaction. The papers and letters of his lordship were accordingly placed in the doctor's hands, and remained in his possession for some time, but no steps were taken in the biography, and it was finally entrusted to Mr. Moore. It is fortunate for the memory of Lord Byron that Maginn did not write his life; as, instead of the romantic fictions to which Mr. Moore has treated us, in which the author of "Childe Harold" is represented as a demi-god, or something just less, we should have a picture of the man, unvizored and unrobed, in his true and natural colours; his whole heart and life laid bare, as he himself wished them to be.

The doctor recommended Murray to publish the letters entire with libels, sneers, satires, sarcasms, epigrams, confessions, and intrigues, unmutilated, and unasterisked, and merely prefix to the work such information as would be absolutely indispensable. Had this been done, the world would now be in possession of the most extraordinary compilation that ever appeared; but Murray got frightened—his great friends came about him, and advised and wept, and entreated and implored; and the task of drawing up the "Memoirs," taken from Maginn, was consigned to one who, having been a Whig all his life, knew best what would please his employers, and expunged all those parts in which they were mercilessly shown up. In a moral point of view, perhaps, we have no reason to regret our loss.

In 1824, the doctor, having been appointed by Mr. Murray, foreign editor of "The Representative," a daily paper, then newly established, went to reside in Paris. That publication, did not, however, flourish long, and on its death the doctor returned to London, where, for a time, he earned a scanty livelihood by writing for magazines, annuals, and newspapers. In the "Literary Souvenir" for 1829, appeared one of his most beautiful tales, "The City of the Demons." In the volume which preceded it, is another, entitled, "A Vision of Purgatory." He contributed principally to the "John Bull," then in its glory, and had obtained so great a reputation as a political writer, that on the establishment of "The Standard," by Mr. Baldwin, he was appointed joint editor with Dr. Gifford. In the same year he published "Whitehall," one of the most wild and extraordinary productions of the day; overflowing with madcap wit and quaint learning, and containing sketches of all the leading characters of the time, from George IV., down to Jack Ketch, the hangman. To the last-named office, by an inimitable stroke of humour, he appoints Mr. Tierney, who, having come up to town with an earnest desire to be made Prime Minister, and having in vain solicited that or some other place, finally, in despair, accepts the office of executioner, and performs the last ceremonies of the law on Mr. Huskisson, who, he tells us, "amid the acclamations of surrounding thousands, died easily and instantaneously." This work is very rare, but it will well repay any one who takes the trouble of searching for it through the old bookshops.

In 1830, "Frazer's Magazine" was established, and with the foundation and management of that brilliant periodical, Maginn was most intimately connected. Some disagreement with Blackwood, we believe, led to the birth of this new and powerful rival, and soon attained a circulation the most extensive and respectable of any of the London published periodicals. A popular and delightful feature in this Magazine was the "Gallery of Literary Portraits"—the letterpress for nearly all of which was written by Maginn. These were entirely original in plan and execution, and created a sensation in literary circles, not often paralleled. The exquisite sketches by Maclise added not a little to their attraction. As a whole, they are, we think, the most original and sparkling of the doctor's productions; and when we remember that they were hit off at a moment's notice, we shall be easily able to fancy how meteoric was the intellect from which they emanated. Wit was their principal recommendation. "This," as Sir William Jones said of Dunning, "relieved the weary, calmed the resentful, and animated the drowsy; this drew smiles even from such as were the object of it; scattered flowers over a desert; and, like sunbeams sparkling on a lake, gave vivacity to the dullest and least interesting theme." And we never read them, without involuntarily thinking we hear the doctor speak, for they are perfect resemblances of what his conversation was.

Maginn was now in the zenith of his reputation and circumstances. He mixed in good society—was courted by lords and ladies of rank and fashion, and moved in the glittering circle of the aristocracy. By Lord Lowther, Lord Francis Egerton, Mr. Wilson Croker, and Lady Stepney, he was received with friendship and consideration; and though he lived, bitterly to experience the truth of Dr. Burney's remark—"what Pliny had said of the cinnamon tree, seems applicable to the

great in general, "corticis in quo summa gratia"—nothing but the mere outside is of value—still the warmest of his friends must admit, that their subsequent desertion of him may be attributed not a little to his own want of prudence. By Mr. Croker he is thus described in a letter, which we have had an opportunity of seeing:—"On the few occasions of my having the pleasure of being in his society, his conversation was very lively and original—a singular mixture of classical erudition, and Irish fun. There was a good deal of wit, and still more of drollery, and certainly no deficiency of what is called conviviality and animal spirits. I remember on one occasion having heard from some common friend, that he seemed to be throwng away a great deal of talent on some ephemeral productions. I took the liberty of advising him to direct his great powers to some more permanent objects, and he told me that he contemplated some serious work, I think on the Greek drama, but of this I am not quite sure. It might have been the Greek orators. I had a high opinion of his power to illustrate either."

By our illustrious countryman, Maclise, he is thus described at the period of which we now write:—"With every desire to do what you request, I find myself embarrassed in attributing the slightest memorandum of my acquaintance with the late Dr. Maginn. Does it not strike you to have been precisely the person, of whom it would be most difficult to survey (to one who had not known him) a true impression? I cannot boast of having seen as much of the doctor, as I was anxious of seeing; for, although known to me from my first arrival in London, yet, whether from his own, and perhaps my active occupations, the usual separating tendencies of distractions of town, differences of purpose, etc., our interviews were not after all as frequent as I could have wished; and when I consider over how many years they were spread, anything I could say of him must, of necessity, assume a tone of the highest panegyric, and I find it difficult to satisfy myself in the choice of any expression sufficiently powerful to convey my idea of his great ability, as a writer, and conversationist, and of his excellent nature as a man. He comes before my general recollection always crowded round by the most pleasant associations, and I can conjure him up in particular situations. A morning walk of my early acquaintance, more recently the morning visit, when I had but to listen and be delighted. Indeed his various gifts and brilliant qualities were always met with prompt acknowledgment, and where wit and wits abounded, one always had the satisfaction of seeing him commanding attention." These were the rosy days of his existence. How full of stern philosophy do they appear, when we contrast them with subsequent scenes, and find him, who, but a brief period before was a visitor in lordly places and drawing-rooms, pining away in the dirty cells and garrets of the Fleet.

In the eighth number of "Frazer" appeared Maginn's famous review of "Berkeley Castle," by Hon. Grantley Berkeley. This was written in Frazer's back parlour at the end of the month, when the whole party was heated with punch. It was scribbled off, with his usual facility, in about an hour, Maginn having scarcely once taken his pen off the paper until he had concluded it; and on its being handed over to the publisher to Father Mahony, the latter said:—

"Jemmy, you had better take care what you do—this seems libellous."

Frazer looked at some of the passages to which the priest objected, but merely said:

"Pooh—we have printed worse—we are at the end of the month, and it must go in."

"Very well," was the stoical remark of the priest, and the paper was set up in type and published. The result is well-known.

The conduct of Maginn, on being made acquainted with the assault on the publisher was honourable. He instantly forwarded a note to the Hon. Grantley Berkeley, apprising him that he was the author of the article. Shortly afterwards he received a card from Major Fancourt, M.P., on the part of Mr. Berkeley, in which it was stated that he was desirous to see him on particular business. The doctor immediately waited on Major Fancourt, and it was agreed between them—the doctor in the meantime procuring a second—that a hostile meeting should take place in the evening, at seven o'clock. The place appointed was a field in the New Barnet Road, and Mr. Hugh Frazer, his old friend, acted as the doctor's second. The parties were placed on the ground at a little before seven, and on the first exchange of shots Doctor Maginn fired rather high, which induced Major Fancourt to ask whether the doctor had done it designedly not to fire at his antagonist. Mr. Hugh Frazer answered that he did not know. The pistols were a second time loaded and placed in the hands of the parties, who fired again without effect. The seconds here interfered, but vainly. A third exchange of shots then took place, Berkeley's bullet grazing the heel of Doctor Maginn's boot, and the doctor's bullet grazing the collar of his adversary's coat. The seconds again interfered, and the parties left the ground without any explanation, merely bowing to each other as they departed. Both behaved with the utmost coolness and deliberation, and not a word was spoken on the occasion, with the exception of the word of command, and the question of Major Fancourt with the answer. Warrants had been issued against the parties, but, as we have seen, ineffectually.

We have now brought the doctor to the year 1837, when his difficulties began to assume a more formidable aspect than they had hitherto worn. Since his dismissal from the "Standard" his affairs had begun to get involved, and the temporary and fluctuating engagements which he got on the "True Sun," "Age," etc., etc., did but little to relieve him.

But there was another external attraction which home less agreeable; and as this formed one of the most remarkable features of his life, it would be unpardonable in a biographer not to allude to it—we mean his supposed attachment to Miss Landon. Whatever were the terms on which he stood with that gifted and fascinating creature, certain it is that the strongest friendship subsisted between them, and we should not be wrong if we said, that at least one-fourth of those poems which combine to form "The Drawing-room Scrap Book," while that book was under the guidance of Miss Landon, was contributel by Doctor Maginn. We have been told by one who heard him read, and saw him correct the proof-sheets of that work, that he made no secret to that person, at least, of having contributed much to the Scrap-book; and he used to repeat those poems which he had given to the fair editress, laughing heartily all the time at the little hoax they were playing off upon the public. In more than one of the volumes there are poems with the doctor's name or initials—but this was done to lull suspicion. On Miss Landon's death Maginn was disconsolate, and almost lost his senses for two days.

In 1834 the doctor had resumed his correspondence with Mr. Blackwood, and to the April number for that year, says Dr. Moir, "he sent the exquisite 'Story Without a Tail,' which was followed, in May, by 'Bob Burke's Duel with Ensign Brady,' almost equally good." Among his new contributions to Blackwood, Dr. Moir has omitted to notice his "Tobias Correspondence," which was written in a little garret in Wych street. in the Strand, when the doctor was hiding from the blood-hounds of the law, and is full of the varied experience of his whole literary life. When a friend applied to him for some hints as to how he should write for newspapers, Maginn merely said, "Read the Tobias Correspondence—there is the whole art and mystery of editing a newspaper." Another, who said to him that he had perceived it had been attacked by the daily critics, received for answer, "The reason is, every word of it is true, and my gentlemen of the press don't like that." In 1837, also, were published his "Shakespeare Papers," consisting of some of the ablest and most beautiful dissertations on the characters of our dramatist that adorns the language. They incline a little too much, perhaps to paradox, but their great ability is universally admitted. Combined with his "Essay on Dr. Farmer," and sundry reviews and criticisms on Shakespeare, which have appeared in "Frazer," they form a most valuable and interesting body of facts, surmises, and annotations on our great poet. In the ninety-sixth, ninety-seventh, and ninety-ninth numbers of "Frazer" was published that strange medley of wit and learning, entitled "The Doctor." It was a review of Southey's fantastical work, and the cleverest of any that appeared. No idea of it could be communicated. To be appreciated it should be read.

In January, 1838, appeared the first of the "Homeric Ballads," which were afterwards continued until he had published sixteen. The last prose paper the doctor ever wrote was a "leader" for the "Age," in which he recommended summary execution on the Chartist demagogues—the last poetical essay was the sixteenth "Homeric Hymn," the conclusion of which was dictated to the writer of this memoir from the death-bed of Maginn. In the same year (1838) he translated the "Comedies of Lucian." As translations they require no praise—but, notwithstanding their excellence, they did not form a popular feature in "Frazer," and the publisher returned one or two to the doctor.

(To be Continued.)

AERIAL BAGGAGE SHIFTER.

An aerial luggage transmitter has been erected recently by the London and Southwester Railway Company at their junction at Woking, and is, we understand, in the nature of an experiment, being it is believed, the first appliance of its kind used by any railway company in the kingdom. In briefly describing it "Engineering" states that on the top and down platforms are erected iron towers, each 32 feet 6 inches in height, and set in blocks of concrete. Suspended from tower to tower are four spans of wire cable. The topmost cable, on which the transmitter runs to and fro, is exceptionally strong, and is capable of bearing a strain equal to at least twenty tons. The second cable keeps the transmitter in position, and the third and fourth cables, which are much thinner and are in one length, are for "paying out" and "returning." Each span is 110 feet long, and the height of the transmitter above the railway is 22 feet 6 inches. Attached to the transmitter is an iron cage capable of holding half a ton at one time. The whole is worked by hydraulic power, the engine being on the down side. Above it is a small box in which are the levers working the apparatus. The transmitter is very rapid in its working, taking only thirty seconds to deposit ten hundredweight of luggage from one platform to another. All the experimental trials have been, it is said, most satisfactory and the transmitter is now ready for use.

Ancient Boroughs of Ireland

From Lewis's "Topographical Dictionary of Ireland," 1837.

GALWAY, a sea-port, borough, and market-town, and a county of itself, locally between the baronies of Clare, Dunkellin, and Moycullen, County of Galway, and Province of Connaught, 51¼ miles (N.N.W.) from Limerick, and 101¼ (W. by S.) from Dublin, on the bay of Galway. Though few particulars of its early history are recorded, this place appears to have been regarded from a very remote period as a position of great importance. In the first division of Ireland, ascribed to Partholan, it was one of the chief points of partition; and in the subsequent division of the island between Heber and Heremon, adopted by Conn of the Hundred Battles and Eogan, King of Munster, it was fixed upon as the western termination of that line of demarcation, of which Dublin was the eastern extremity. There is every reason for supposing it to be identical with the "Nagnata," or "Naguata," of Ptolemy, described as the principal city on the western coast. Baxter adopts this opinion, from its original name, "Cuan-na-guactie," signifying in the Irish language, "the port of the small islands," descriptive of its situation both with respect to the isles of Arran at the mouth of the bay, and to the smaller islets in the more immediate vicinity of the town. The power of the Danes having been destroyed by the decisive battle of Clontarf, the people of the surrounding district, aware of the importance of its situation, erected a strong castle for its defence, which so powerfully excited the jealousy of the people of Munster, that Conor, King of that province, in 1132, despatched a body of troops and levelled it with the ground. In 1149, the town and castle, the latter of which had been restored, were taken and destroyed by Turlough O'Brien, King of Munster; but they appear to have soon revived, for, in 1154, the ships of "Galway Dune" were sent to the northern part of this island; and it is recorded that, in 1161, strange ships were seen in the harbour, and that the town took fire; the Annals of Innisfallen notice also another conflagration, in 1170. At the time of the English invasion, the town contained only a few families and some fishermen, under the protection of the O'Flahertys' who then held the castle and the surrounding territory. The first notice of it that occurs after that event is the return of Fiedlim O'Conor, King of Connaught, from the English Court, whither he had gone to lay before the English monarch his complaints against Richard de Burgo. Hugh O'Flaherty, embracing the cause of Fiedlim, fortified the castle of Galway, and in 1230 baffled every attempt of De Burgo to dispossess him; but on the defeat of Fiedlim, about two years after, the town and castle fell into the hands of De Burgo, who, though he lost them again for a short time, ultimately recovered them, and made this place his principal residence and the capital of the province; he secured it with additional fortifications, and established a municipal government under a magistrate of his own appointment. In 1270, the erection of walls for the defence of the town was commenced, and continued at intervals, by grants for that purpose, till the end of that century, when they were completed. The increased security of the place encouraged the influx of strangers, among whom was a number of new settlers, consisting of 13, or according to some, 14 families, known under the appellation of the "tribes of Galway," who enriched themselves by commerce and the purchase of lands.

The town, which rapidly increased in commerce, so as to surpass the rival city of Limerick, was, in 1312, strengthened by the erection of the great gate, and additional works under the superintendence of Nicholas Lynch, surnamed the "Black Marshall." On the death of William de Burgo, the third Earl, who was assassinated by his own servants, a great change took place. That nobleman, leaving only a daughter, the heads of the two younger branches of the family, fearing the alienation of the estates by marriage, threw off their allegiance, and, adopting the Irish customs, assumed the native titles of Mac William Eighter and Mac William Oughter; the former took possession of the town, with the territory towards the Shannon, and led the inhabitants into revolt; but on his returning to his allegiance, tranquillity was restored. In 1375, by grant of a charter of the staple, the merchants of Galway and Connaught were permitted for three years to pay the customs due to the Crown at Galway, which was thus placed on an equality with the cities of Cork, Dublin, and Waterford. In 1396, the town, which had hitherto exercised its corporate privileges only by prescription, obtained from Rich. II. a perpetual grant of the customs for the repair of the walls, and also a charter of incorporation, conferring many privileges, which charter was confirmed in 1402 by Hen. IV. A licence for coining, which had been hitherto confined to Dublin and Trim, was, about this time, granted to Galway by statute, specifying the value and character of the coins to be struck. During the reigns of Hen. VI. and Edw. IV., the commerce of the port extended to many parts of Europe, particularly to France and Spain, whence large quantities of wine were imported. In 1484 a new charter was granted to the town, vesting its government in a mayor and bailiffs, and expressly ordaining that neither the Lord Mac William of Clanricarde, nor any of his family, should exercise any authority within its limits. In 1493 occurred the melancholy execution by the mayor, James Lynch Fitzstephen, of his own son, for murder, whom, to prevent an intended rescue, he caused to be hanged from a window of his house, under which are carved a skull and cross bones in memory of the tragical event.

During the reign of Hen. VIII., frequent disputes between the inhabitants and the men of Limerick arose from a feeling of rivalry, which were eventually terminated by treaty, and to their instigation did the former attribute the revival of a claim made on them by the Earl of Ormonde for prisage of wine, from which they had been previously exempt. The question, however, was decided in favour of Galway by the Court of Star Chamber; the decision was of the highest importance to its merchants, who at that time supplied nearly the whole kingdom with wine, for which purpose they had vaults at Athboy, of which the remains are still to be seen. A royal ordinance was issued at the same time, by which the merchants of Galway were prohibited from forestalling the markets of Limerick; and in 1545 a new charter was granted, defining the limits of the port, which were made to extend from the isles of Arran to the town, and permitting the exportation of all goods and merchandise, except woollens and linens, with exemption from prisage and a confirmation of all former privileges. Edw. VI. granted a confirmatory charter, and the town continued to increase in prosperity; but the tyranny of Sir Edw. Fitton, the first President of Connaught, having excited an insurrection, it was harassed by the incursions of the neighbouring septs, and many of the principal inhabitants were induced to seek protection from Mac William Eighter. In 1579, the inhabitants received a charter from Elizabeth, with reversionary leases of the dissolved monasteries, the fisheries, the cocket, and lands of the value of 100 marks; but a few years after the Earl of Ormonde reasserted his claim to the prisage of wine, which was allowed by the Court of Chancery. About the year 1594, Hugh Roe O'Donnell, having destroyed Enniskillen and burnt Athenry, appeared before the town, and being refused a supply of provisions, set fire to the suburbs, but retreated without doing further injury. In 1660, Lord Mountjoy erected a strong fort on the hill where the Augustinian monastery stood, which completely commanded the town and the harbour; and soon after the accession of Jas. I., the town and lands within a distance of two miles round it were by charter constituted a distinct county, of which the Earl of Clanricarde was appointed Governor, with powers equal to those he exercised as President of Connaught.

Soon after the commencement of the war in 1641, the inhabitants joined the Parliamentarians, and the Earl of Clanricarde invested the town and speedily reduced it to submission; but his exertions to retain it for the King were frustrated by the violence of Capt. Willoughby, commander of the fort, which induced the people to open their gates to the enemy. From the great numbers that fled to the town for shelter during this period of intestine war, the plague broke out in July, 1649, and raged with violence till the April following, during which time 3,700 of the inhabitants fell victims to its ravages. The Marquis of Clanricarde, wishing to borrow £20,000 for the King's service, offered the revenues of Galway and Limerick to the Duke of

Lorraine as security, but the negotiation failed. On this occasion a large and very accurate map of the town was drawn and engraved, two copies of which are still extant. In 1652 the town was invested by the Parliamentary forces under Sir C. Coote, when Preston, the Irish commander of the garrison, having quitted it and embarked for France, the inhabitants surrendered on favourable conditions. On the proclamation of Richard Cromwell as Protector, in 1658, so great a tumult was excited that the corporation was threatened with the loss of its charter. In 1690 the town was put into a state of defence and garrisoned for Jas. II., and in the following year the Protestant inhabitants removed into the western suburbs. After the battle of Aughrim, Gen. De Ginkell, with 14,000 of William's army, laid siege to it; after holding out for some time, it surrendered on the 20th of July, 1691. The works raised by both armies were levelled, the fort near the town was repaired, and a new one erected on Mutton Island, in the bay, for the protection of the harbour. Previously to the disturbances of 1798, 400 of the inhabitants formed themselves into eight companies of volunteers; and on the landing of the French at Kilcummin bay, the merchants supplied Gen. Hutchinson with money, which enabled him to join Gen. Lake with the garrison and yeomanry of the town, who consequently shared in the defeat at Castlebar.

The town is most advantageously situated at the head of the spacious bay to which it gives name, and at the mouth of a river issuing from Lough Corrib, which, after a winding course from that lake through the town, falls into the bay. The more ancient part is built on the plan of a Spanish town; many of the older houses are quadrangular, with an open court and an arched gateway towards the street. Two bridges connect the town with the western district of Iar-Connaught; one built in 1342, which is still in good repair; and the other higher up the stream, a handsome structure built in 1831, and connecting the county court-house and prison. From the latter is a highly interesting view, embracing up the river the fine Elizabethan structure of Menlough castle, on its right bank, and downwards the shipping in the harbour, with the suburbs and the lofty mountains of Clare.

By charter of 29th Charles II., the corporation consists of a mayor, two sheriffs, an indefinite number of free burgesses, a recorder, town clerk, mayor, and two constables of the staple, sword-bearer, chamberlain, water-bailiff, and other officers. The borough appears to have first sent members to a Parliament held at Tristledermot, now Castledermot, in 1377, and notices of the provost and bailiffs being summoned to subsequent Parliaments till 1559 are on record. The right is recognised in the charters of Jas I. and Chas. I., and the corporation continued to send two members to the Irish Parliament till the Union.

No vestiges can be traced of the Franciscan friary without the north gate, founded in 1296 by Sir W. De Burgo; of a Dominican friary near the west gate, previously a cell to the Premonstratensian abbey of Tuam; an Augustinian friary, founded in 1508 by Stephen Lynch and Margaret his wife; a Carmelite friary, a nunnery on an island in Lough Corrib; or an hospital of Knight Templars. There are numerous ruins of ancient castles in the neighbourhood. Among the more distinguished natives of Galway may be noticed Patrick D'Arcy, author of the celebrated "Argument on the Independence of Ireland," in 1641; John Lynch, author of "Cambrensis Eversus," "Althinologia," and other tracts; Roderick O'Flaherty, author of the "Ogygia"; Sir G. L. Staunton, secretary to Lord Macartney, and writer of the account of that nobleman's embassy to Pekin; Walter Blake Kirwan, celebrated as a popular preacher in Dublin; and Richard Kirwan, an eminent chemist nad mineralogist. James Hardiman, Esq., author of the History of Galway, has a villa near the town. Galway gives the title of Viscount to the family of Monckton.

FROM WITHOUT.

The lamps, so lank and ghastly,
Are shivering in the street;
And on my face more fastly
Is borne the blinding sleet.

As shelterless I wander
Without in mist and storm,
The happy fireside yonder
Is blazing bright and warm.

And through the fog more faintly
The casement gleams above,
With light more pure and saintly,
Where rests the one I love.

Me in the gloom she sees not,
Still less she sees how dear
My gloomy heart has loved her
For many a hopeless year.

"Lost hope returneth never;"
I read it as I pass,
In those wild faces, crowding ever
Beneath the shuddering gas.

The children of the city,
We know the stepdame's art,
Who has no mother's pity
Within her stony heart—

Youth! Beauty's ghastly traces!
O love! a fearful sign,
That thus can look the faces
That once were sweet as thine!

The spectres of our city,
For them whom thus I see,
God gives me deeper pity,
With purer love for thee.

THE ROCKING OF LAKE ERIE.

The 250-mile trough of Lake Erie lies approximately in the direction of the west to south-west winds which prevail in that part of the country. Thus the lake offers an excellent opportunity for studying the effects of the wind upon a large body of enclosed water, and very interesting these effects sometimes prove. Rhythmic gusts produce a rocking motion, and great blows from the west or south-west, like that, for instance, which accompanied the Galveston hurricane in September, 1900, sweep the liquid body of the lake eastward, and sometimes cause a rise of eight feet or more at Buffalo in the course of a few hours. As soon as the maximum force of the gale has passed, the water swings back. Continued rockings are observed on days when the strength of the wind fluctuates.

OUR WEEKLY STORY

OUR THREEFOLD WOOING OF MAID AND FORTUNE.

By L. M. SCOTT.

PART I.

The beginnings of our friendship were not essentially unlike the beginnings of friendships among other persons of common ambition, so are not particularly worthy of being detailed. We became acquainted in a little down town restaurant much frequented by newspaper men of meagre salaries. All three of us were trying to write, and trying to write well; and it was this community of desire that first drew us together. Besides, all three of us were poor. Dexter Andrews had had a newspaper position and lost it; Robert Vance had had a considerable newspaper experience in Philadelphia, but had come to New York to get into a wider field, and was still running at large, untethered to any office; and I, Maximilian Henry, had given up a regular salary with one of the dailies for the uncertainties of more ambitious authorship. At that time we were all subsisting mainly on small and infrequent cheques from Sunday editors.

Three months after our first meeting found us living together in one large front room in Twentieth street—a room on the fifth floor of a building which had no elevator, so that it was a saying with us, that when we reached the entry door, after a walk from Park row, we were just half-way home. Here we settled down to do the best that was in us, and, since we were all writing, from the very start we sat as critics upon one another's work, and even gave other than advisory assistance; and soon it came about very naturally that we collaborated in practically everything we wrote. Then, since we were sharing in the labours of composition, we mutually agreed that we should also share in any accruing honour—should use a signature that belonged equally to each of us. What this signature should be was the theme of many futile discussions. Finally an idea presented itself to Vance, which was adopted the instant he presented it to us—that our common work be signed by a composite name made from our surnames. By reason of the superior fitness of my surname for prenominal use, I was permitted to furnish the Christian name for our nom de guerre. Vance was set down next, and Andrews last, because we judged that they sounded best in this order. Thus we incorporated the writer in each of us into one literary personality, and Henry Vance Andrews came into existence. Since I was twenty-five, Vance twenty-two, and Andrews twenty-four, the age of Henry Vance Andrews was seventy-one, or twenty-three and two-thirds—just as it pleases you.

The writings on which we lived were sold, for the most part, to the daily papers—especially to their Saturday and Sunday editions. We divided the newspapers into three lists, and we ruled that all business to be transacted with any paper should be seen to by the one of us on whose list that particular paper was enrolled. Though each of us was Henry Vance Andrews to his assigned editors, by this division we kept from them that, while in a literary way Henry Vance Andrews was a unit, physically he was three. Some weeks we were rich and lived high, and some weeks we were poor and lived very low indeed. I should say that the income of Henry Vance Andrews averaged about that of one newspaper man on a salary.

But besides the things that we wrote for the newspapers and sold, there were the things that we wrote for the magazines and didn't sell. The first we wrote to keep us living so that we might write the second; and these second we talked over and dreamt over, and recast and rewrote, and recast and rewrote

again, till I think our theme was sometimes actually worn away from over-handling. The first we regarded, somewhat condescendingly, as pot-boilers, but few of the petted second ever evidenced a similar ebullient quality.

I was, and am, far from a brilliant writer; I am a plodder, counting for success rather on acquired skill than on any God-given ability, for the last I have not. Andy wrote only passably—and still writes only passably. Andy is a Scotch youth, given somewhat to silence, with steady gray eyes and a square chin, and determination written large all over him. Some day Andy will overpower success. Bobbie is unlike either of us; to recognise that, you have only to note his broad, white forehead, his soft and glowing brown eyes, and his sensitive, mobile mouth. It would gall me to admit that any other man is my superior, but it doesn't gall me to admit this about Bobbie; Bobbie is of a far finer sort than I. In a time to come he will write exquisitely simply because he can't write otherwise—by the grace of God.

But I am getting ahead of myself with my "Bobbie" and my "Andy," and shall have to double to write down that while we were 'Vance" and "Andrews" and "Henry" to one another during the first few weeks together, Vance soon became "Bobbie" and Andrews "Andy," and that, by an evolutionary process, started by Bobbie and suggested to him by my baptismal name being identical with that of an unfortunate royal gentleman who voyaged to Mexico, my Maximilian was transformed into "Emperor," and this, at the demands of vocal economy, was later curtailed to "Emp."

We soon grew to love one another with the almost love of a man for a woman. Once I would have said "with the love of a man for a woman," but that was before I—and the other two—knew how deep and tender the love of a man for a woman could be. We never said that we cared for one another; that isn't the way of young fellows who are just getting into manhood. But I would have set most of the Ten Commandments at nothing for Bobbie's or Andy's sake, and I knew that they would have broken most of them for me or for each other. It is not at all remarkable that I loved them, and that Andy loved Bobbie and Bobbie loved Andy, for Andy was clean and strong and impressively determined, and Bobbie was very like the Keats of my imagination, but withal more strong in spirit. I do not know why they liked me.

That three young fellows, though they are nearer to each other than brothers, can fall in love with the same girl without their love for one another suffering a decrease, will doubtless be set down by the world as improbable; and a part of the world, acquainted with man only in his more selfish development, may declare it impossible. I do not care to debate with these. I desire only to say, very simply, that I know it is possible. It was the experience of Andy, Bobbie, and me.

I shall never forget the first time I saw her. I was on the point of entering our street door one afternoon when I saw come out of a boarding-house, directly apposite, a girl who made me pause with my hand on the knob. She had on a gown of some dark red stuff, and a round red hat whose colour was half smothered by a black veil loosely twisted about it. She looked wonderfully neat, but as much as the trimness of her appearance it was her poise, as she stood an instant on the top step finishing the buttoning of one glove, that compelled my attention.

When she started down the street I, without having consciously willed one thing or another, started to walk rapidly down my side in the same direction. At the end of the second block I crossed and turned back. As we passed I gave her a quick, all-noting look. I think that this was when I began to love her.

After this we saw her quite often, and we knew her among ourselves as "the girl across the street." Bobbie was the first to be introduced to her, and through him Andy and I met her. We then learned that she had a voice and was in New York to cultivate it—a rich and round but rather light contralto. Still later we learned—after we had become good friends she talked very simply and openly to us—that she was an orphan and that her income was barely as large as her expenses when the latter were kept very small.

It is not to be wondered at that we three, having so many tastes in common, all fell in love with her. It would rather be a cause for wonder had we not. We never made mention of our love among ourselves; but, none the less, that each of us did love was silently recognised and silently accepted by the others. And we never spoke of it to her. Three fellows, with but one fellow's salary among them, are hardly in position to talk of love. As for her, she liked us and liked us very much, but as far as we could see she seemed not to distinguish one of us from another in her favour. She was wholesome and fun-loving, and cared for the things it is natural for a girl of twenty to care for; and she was very simple, and was very sweet, and she sang with a voice that seemed the very voice of her soul. If I were a painter and given to idealized womanhood, I should make all my women with hair that is black and waving, and with skin that is clear and dark, and with eyes——

But it would be beyond me to paint the eyes of Mary Gordon.

One afternoon, when I was trying to work an article into shape and Bobby and Andy were out gathering material, there came a letter that made an end of writing for that day. At first I laughed, for I saw only the letter's absurdity; then its serious import appealed to me; and then a germinal idea shot up through the soil of my mind, and I walked the room nervously and eagerly, the while the idea grew into a perfected plan; and now and again I looked steadily, for I know not how long at a time, across the street at the window that was Miss Gordon's. At length I wrote out a reply on our typewriter and put it, unsigned, into an envelope addressed to the letter's author.

I said nothing to Bobby or Andy till after we had come back from dinner and were lounging round our table. Then I drew out the letter and handed it to them.

"This came this afternoon," I said, briefly.

Andy unfolded the sheet of paper, and Bobbie left his chair and leaned over Andy's shoulder; and thus the two read the letter. It ran in this wise:—

"Mr. Henry Vance Andrews, New York City."

"My Dear Mr. Andrews—A vacancy has just occurred on our Sunday staff which it is highly necessary that I fill at once. My predecessor, who, it seems, has used a great deal of your work and been well satisfied with it, recommended you for the place. I write to offer you the position, provided you can go to work immediately. The salary will be thirty-five dollars ($35.00) per week. If you accept I shall want you to report for duty to-morrow morning."

The signature was that of the newly-appointed Sunday editor of one of the daily papers—an absolute stranger to all of us.

The letter fell from Andy's hands to the table, and Andy's hands fell, palms downward, upon the letter, and he turned a dumbfounded face up to me. Bobbie also showed me a face in which there was stupefaction.

"Well!" said Andy.

"Did you ever hear the like?" said Bobbie.

Then suddenly Bobbie, who was ever the quickest of us, smacked his right hand down on Andy's right shoulder. "Say, but isn't this rich?" he shouted, giving Andy's shoulder a smack with each word. "Henry Vance Andrews! Understand!—a job for Henry Vance Andrews! One man's job for the three of us!" And he tumbled over on the couch and lay there howling and kicking his legs in the air.

Andy had to laugh, too; but I had passed this point long ago, and my mind was far ahead.

Suddenly Bobbie sat upright on the edge of the couch. "Say, it's one on the editor, too, isn't it? Suppose he knew that there were three of Henry Vance Andrews?" He went to his back again, and again made frantic semaphoric signals with his legs.

An instant later he sat upright on the edge of the couch a second time, his face now quite serious. "But, say, fellows, that's a good offer, if you only know it. What——"

"As much as the three of us are making now," interjected Andy.

"What are we going to do about it?" concluded Bobbie.

"We are going to accept," said I.

"Oh, you don't say! But don't you think it'll be a little hard on the editor-man when we walk in to-morrow, line up, bow, and say, 'Good morning, sir; we are Henry Vance Andrews'?" Bobbie asked solicitously. Then the show of solemnity left him. "There'll be only one chair and one desk. Andy, you've got to be the bottom man, and, Emp, you've got to sit next. I won't consent to acceptance, positively won't, unless I can sit on top!"

Andy and Bobbie chorused in a long laugh, and I smiled, though I was thinking of something else—of the something I had been thinking of ever since the letter had come.

After a moment I said, very quietly, "One of us is going to take it."

There was something in my voice, something in my face, or something in my manner, that suddenly brought them back to seriousness. Andy glanced at me and was grave, and after a quick look into my face Bobbie slipped silently back to his chair. They waited on me in expectancy.

Now that the time had come for me to speak, it was harder than I had thought. My heart seemed to be throbbing throughout my whole body, and in my head was whirling chaos. My face must have been white and strained, for the face of Andy and the face of Bobbie gradually became so. Looking down I saw that my hands were tightly twisted into each other. I loosened them and put them beneath the table, where they interlocked again.

I bent forward and forced the words from my mouth. "It's enough to keep a wife on," I said.

They gave a start and leaned toward me, suddenly tense and rigid, and wonderment fairly projected itself from their fixed faces. Then for a space there was such a silence as the winking of an eye would have broken.

"Enough to keep a wife on," I repeated at length. Then I gathered my strength for my hardest words. "I love Mary Gordon," I whispered, hoarsely; and my eyes went down as I spoke.

When I looked up again the were sitting just as they were before, save possibly that their faces were more tense and white.

I centred my gaze on Andy. "And you?—you love her?"

For a time I thought he was going to make me no reply. Then his lips twitched. "Yes," he answered.

I turned to Bobbie. "And you?"

Bobbie looked straight into my eyes, but he did not reply. I do not think he could have spoken just then. But I needed no verbal answer.

I began again; after the first this was a little easier. "If I could afford to keep a wife, I'd ask Mary Gordon to marry me."

I looked at Andy and waited.

"I would ask her," he whispered, with dry lips, "if I were making a good salary." His left hand slipped out and laid itself on the editor's letter.

I looked at Bobbie

Bobbie's face suddenly filled with colour, like an empty wine-glass that receives red wine. He dropped his head down upon his folded

arms and his shoulders shook. "God knows I would! I'd give the world to!" he sobbed.

Andy's big right arm slipped across Bobbie's shoulders and remained there; but Andy's eyes stayed with me

"If one of us had that salary he could marry her," I suggested, continuing with the unfolding of my plan.

"If she would have him," amended Andy.

I nodded.

I had now attained the ground toward which I had been travelling. I reached out and took the editor's letter from beneath Andy's hand. "Suppose——" I began, then hesitated. My self-assigned part was not an easy one.

Andy's eyes were still set on me, and in them there were both command and appeal that I go on. And so I began again, in a low voice, speaking straight at Andy.

"Suppose we put the two together—the position and Miss Gordon: the one of us that gets one gets the other."

Bobbie suddenly raised his head and half started from his chair. "What's that?" he cried.

I repeated.

"You don't mean, do you, to put the two together and draw lots for them?" asked Andy in an awed whisper.

"Not that—no. I mean that we all three ask her to marry us, and the one she accepts will get the position. He'll deserve it."

Bobbie rose tremblingly to his feet, and then Andy rose. They stood staring at me, waiting. I never saw Bobbie's eyes look quite so large. I also stood up.

"It's like this," I continued. "Only one of us can take the place. That's clear. We might draw lots for it, of course. But instead of leaving the selection to chance, I'd rather leave it to Miss Gordon. Instead of the one of us that draws the longest straw taking the place, why not have the one take it that Miss Gordon cares for?"

I paused, but neither of them spoke; only continued to stare at me.

"It will be perfectly fair," I went on. "As fair for one of us as for any other. None of us has said a word to her about—about caring for her. I know that. And she has treated us all alike—so it has seemed to me. We'll all ask her, and the one she takes will go to work to-morrow morning. He'll be Henry Vance Andrews. He can use that name, or tell the editor that it's a pseudonym and use his own."

(Conclusion Next Week.)

SAND PAINTING.

One of the most curious native customs of India is that of making sand pictures, or "sand painting," as it is often called. It is generally done on festal days in front of both houses and temples, and it has a religious significance. The sand, which is prepared and sold by natives of the Deccan, is white, red, black, blue, orange, and purple.

A woman who has observed certain preliminary ceremonies takes the sand in her hand, and allowing it to trickle out as she move her arm, forms upon the prepared ground in front of the door curious coloured designs, enclosed with a border, and representing human figures, crosses, semi-circles, or birds.

One explanation of the purpose of these pictures, according to Mr. J. W. Fewkes, is that they are believed to attract good spirits. To step on a sand painting brings bad luck.

This strange custom assumes a scientific importance when it is known that it prevails in almost exactly the same form among the Tusayan Indians in the south western part of the United States. The Pueblos, like the Hindoos, ascribe to the pictures the power of attracting friendly spirits, and they also use them in ceremonials intended to cure the sick. It has been suggested that as far as it goes this fact is an indication that our Indians are related in origin to the native races in India.

The first European discoverers of America thought they had hit upon the eastern extremity of Asia when the name of Indians was given to the red-skinned people whom they found there. Would it not be a singular coincidence if further evidence of community of origin should finally establish the fact that the Indians are really Indians?

JOHN O'DONOVAN.

By EBLANA.

II.

Poor, paltry skulker from thy noble race,
Infielix Felix weep for thy disgrace.

On the other hand, O'Donovan praised the chiefs and others of some of the families to whom the prefixes had been strangers for centuries, but who had lately resumed them. He instances O'Connor Don, O'Grady, O'Reilly, O'Connell, O'Donovan, O'Brien, MacDermott, MacCarthy, O'Neill, and others. He thinks, however, that the secret of this re-awakened pride was due in part, at least, to the fact, that while at home in Ireland, thousands of humble and poverty-stricken inheritors of these great names were ashamed to own to them, owing to their own condition and the flouts and jeers of the new aristocracy—descendants of Cromwell's troopers—yet abroad, the remnants of the "Wild Geese"—the Irish Brigade carried with glory their ancient names, prefix and all, over the battle-fields of Europe, and in the Senate and the Council Chamber and Court of every Continental State.

The Irish Archæological Society was founded in 1840, chiefly through Dr. Todd, and in the following year the first volume of its publication appeared, containing a text and translation with notes of "The Circuit of Ireland." by Murcheartach O'Neill, a poem written in 942 by Cormacan Eigeas. This, too, was the work of O'Donovan, and in it he published the first good map of ancient Ireland.

In 1842 he published "The Banquet of Dun-na-nGeedh" and "The Battle of Magh Rath," two historical tales. It was a quarto of 350 pages, with text, translation, notes, genealogies and appendix.

In this year, 1842, he and his colleagues in the Ordnance Survey met with a cruel disappointment. The English Government, filled with alarm at the revelations of Ireland's former greatness and civilisation, which such of the records as had been published showed, and also begrudging the expenditure of Irish money for mere Irish purposes when so many English objects needed it, suddenly stopped the grant for the historical department. And, therefore, the immense mass of materials which they had collected with such study and labour, mental and physical, for so many years, and at which they had arranged to labour still more, till they were given to a wondering world, had to be locked away from public gaze to await the time—should it ever come—when no foreign intervention or greed should bar their publication.

But although cut off from employment in this matter he found kindred if more precarious means of livelihood in various ways. He published in 1843 "The Tribes and Customs of Hy Many," called O'Kelly's Country, a MS. of 1418, from the "Book of Lecan." In addition to the translation and notes, he added a long Irish treatise on the boundaries of O'Maine, and another on the descent and merits of the O'Maddens. Then there was the "Feilire," or "Calendar of Irish Saints."

In the same year he prepared a text and translation of the "Sanas Chormaic," a glossary by the famous Cormac MacCuillionan, King and Archbishop of Cashel, who lived from 836 to 908. Cormac's work was to gloss his predecessors, and O'Donovan's was to gloss Cormac himself. It was not printed, however, till after his death, when it was published by Dr. Whitley Stokes, who added the translation of another MS. and philological notes of his own. He (O'Donovan) also edited the Poems of O'Dugan and O'Heerin for the Archæological and Celtic Society.

In 1844 O'Donovan published "The Genealogies Tribes. and Customs of Hy Fiachrach," called O'Dowda's Country, the text printed from a MS. of Donald MacFirbis, and accompanied by many extracts from other MSS. with notes, and a splendid map.

In 1845 he wrote his "Irish Grammar" for the use of senior classes in the College of St. Columba, T.C.D. He had been preparing it for seventeen years. In his introduction to it he says:—

"Letters were known not only to the Milesian colony but also to their predecessors, the Tuath De Danaans."

He was aided in this work by Drs. O'Curry and Todd.

"It will always," says Norman Moore, "remain the most interesting treatise on mediæval Irish spoken and written for the last six centuries."

The expenses of its printing and publication were divided between O'Donovan and the College.

A small Irish primer was issued at the same time.

About this time he married Miss Mary Broughton, sister of the wife of Eugene O'Curry, and thus further cemented the already close friendship subsisting between him and that distinguished man.

It, therefore, behoved him to consider his future. For all his immense labour he was very badly paid, indeed. Accordingly he commenced the study of the law, while still continuing his more congenial work, and was called to the bar in 1847.

In 1846 the edited the "Irish Charters" and translated the "Martyrology of Donegal," which were not published till after his death, with index, etc., by Drs. Todd and Reeves.

He also wrote a most learned and painstaking "Supplement to O'Reilly's Irish-English Dictionary," with "Alphabetical List of Abbreviations and Authorities quoted in this work." But he did not live to see it published.

He was in full sympathy with the National aspirations of his country, and on the establishment of the "Nation" newspaper, by Gavan Duffy and his associates, was, with O'Curry, among the first to contribute to its pages.

He also wrote in the "Ulster Archæological Journal" on "Lost Irish MSS.," on "Hugh O'Neill," on the "Last Earl of Desmond," on "Bawns," on the word "Aesar," and on the "Errors of Edmund Spenser.

But now came the great work of his life. Anent this, the Very Rev. Dr. Reeves says:—

"Before the middle of this" (the 19th) "century, Providence placed in Dublin two men who, in their respective departments, did more to advance archæological literature in Ireland than any two men who ever existed; and those two men were John O'Donovan, the great Irish scholar; and the other was George Smith, the publisher."

The public spirit and enterprise of the latter thus received its due meed of praise, and Dr. Reeves added:—

"He took in hand a work of great magnitude and of doubtful remuneration. In undertaking that work he had at hand the command of the services and genius of that wonderful man, John O'Donovan;" and "He" (O'Donovan) "became the most distinguished person that ever took in hand the analysis of Irish monuments and literature. He had a most wonderful faculty for identification of names, had a wonderful store of Irish genealogy in his head, had a most retentive memory, which, coupled with untiring

energy on his part, rendered him a perfect oracle in his line.'

We have seen that many years before, during his visit to Heath House, he commenced that portion of the "Annals" relating to the O'Reilly family in honour and gratitude to his host and friend. He little dreamt then to what it would lead. But now the time had come when he was to carry through and complete this enormous work.

Originally compiled between the years 1632 and 1636, from more ancient books, in the Franciscan Monastery of Donegal, and hence called variously the "Annals of Donegal," the "Annals of Ulster," and of "The Kingdom of Ireland," and from the compilers, the "Annals of the Four Masters." These latter were Michael O'Clery, Cucogry, or Peregrine O'Clery, Conary O'Clery, and Peregrine O'Duigenan.

The family of the O'Clerys had been for centuries the hereditary historians to the O'Donnells, Princes of Tirconnell, from whom they had extensive grants of land in Donegal, and resided at their Castle of Kilbarron, near Ballyshannon. O'Duigenan was a learned antiquary of Kilronan, in Roscommon. They were assisted by the two O'Connerys, also of Roscommon, and whose family had been historians of the Kings of Connaught. The project was first suggested to Michael O'Clery while at Louvain by Hugh Ward, lecturer and guardian of that College.

Michael O'Clery dedicated the work to Fergall O'Gara, Lord of Moy O'Gara and Coolalein, and M.P. for county Sligo in the Irish Parliament in 1634, who was foremost in setting the antiquaries to work, and who liberally bore the necessary expenses. Appended to this dedication is a genealogy of O'Gara.

Of course, this work was compiled entirely in Irish. Dr Charles O'Connor, who lived from 1764 to 1828, published an imperfect edition of these "Annals Rioghachta Eireann," or of the Kingdom of Ireland, up to 1171, translated into Latin and with the Irish text.

And now, in 1846, while O'Donovan was preparing for the work, he was forestalled by Owen Connellan, historiographer to George IV. and Willim IV., and author of an Irish grammar. It was annotated by himself and Dr. Philip MacDermott, with assistance from Sir William Betham's library, and published by Bryan Geraghty, of Anglesea street.

This was the first translation of the work into English, and embraced the period from 1171 to 1616. The Irish text was ommitted.

But valuable and learned, as no doubt this edition was, it did not satisfy the learned critics of the day. Besides, O'Donovan had already in hand a preliminary translation of the second part from Petrie's copy of the "Annals" in the Royal Irish Academy, and had been steadily working at it for many years, his other antiquarian work and his travels through the country being of enormous assistance to him, as evidenced in the surprising width of knowledge and historical and antiquarian acumen displayed therein. Then, too, he was resolved to give the Irish text as well as the translation and notes.

Petrie designed the Irish type; and in 1848 three volumes, comprising the second part of the "Annals," that is, from 1171 to 1616, appeared.

Of course, O'Connellan's edition was nowhere now; and we must acknowledge that it was rather hard upon him, after all his expenditure of time and trouble. Still he might have borne this trial with dignity and resignation, if not with pleasure, considering that the occasion of it was a furtherance of the cause he seemed to have at heart. But he did not elect to do so.

Truth to tell, though labouring in the same field, his point of view was not at all that of O'Donovan. Although an Irishman, and even a Milesian, and engaged in the work he was at and all, he looked at even Irish antiquities as much as it was possible to do so, through English spectacles. He was Irish historiographer to two English Kings, and he held other appointments scarcely more reconcilable with the work he had taken in hand. The very fact that he omitted the O from his name counted for much in his case, though for little or nothing at all in that of most people either at that time or even since, considering its long suppression. Altogether Owen Connellan, as he called himself, was not the man to welcome a more able and more patriotic fellow-labourer in the same field; and accordingly he knew of nothing better to do than to assail O'Donovan with bitterness and scorn. Unfortunately it is an Irish vice, which so often mars the many virtues of the race.

In a paper read before the Royal Irish Academy, the Right Rev. Dr. Reeves stated that it was in consequence of this attack upon him that O'Donovan wrote to the Rev. Dr. Todd, giving his autobiography up to the time when they first knew him. To this we are indebted for most of the facts of O'Donovan's life up to the year 1829. The concluding passages of it in his own words will best convey the nature of his rival's attack upon him:—

"Such is the history of my 'bit of learning' to which my friend, Owen Connellan, alludes, and to such did Sir Guy allude, when he called me a 'Philomath,' which is, as you know, a contemptible name for a 'country schoolmaster.' But I will let them pull away as they like, and will continue my acquisition of a 'bit of learning' as long as my mind is capable of acquiring any."

And he kept his word. He continued to acquire and to give the world the results of his "bit of learning."

By the year 1851 he had completed the second part, which was the first part historically, of the "Annals of the Four Masters," i.e., from the beginning A.M. 2242 down to the year 1171, in three volumes and an index, making in all seven volumes and 4,169 pages.

This latter portion was much more onerous, as he had not the preparations made for it which he had for the earlier part of the work.

The work in its entirety was printed by Gill, and published by Hodges and Smith, with genuine public spirit. From this final work of O'Donovan all later writers on such subjects mostly draw their information.

For this great achievement Trinity College, Dublin, conferred on O'Donovan the degree of LL.D. The Royal Irish Academy, Dublin, awarded him its highest distinction, the Cunningham medal; and he was also elected honorary member of the Royal Academy of Sciences, Berlin.

His brother-in-law, friend, and colleague, Eugene O'Curry, thus wrote of it:—

"The translation is executed with extreme care. The immense mass of notes contain a vast amount of information, embracing every variety of topic—historical, topographical, genealogical—upon which the text requires elucidation or correction; and I may add that of the accuracy of the researches which have borne fruit in that information, I can myself, in almost every instance, bear personal testimony. . . There is absolutely nothing left to be desired. . . There is no instance that I know of in any country of a work so vast being undertaken, much less of any completed in a style so perfect and so beautiful by the enterprise of a private publisher."

But besides this "Obair Mor," Dr. O'Donovan, as he was now known, translated, annotated, and edited for the Celtic Society the ancient work known as the "Leabhar na gCeart," or "Book of Rights," originally compoiled by St. enan, the disciple and comharba, or successor of St. Patrick at Armagh, and afterwards revised and added to by King and Archbishop Cormac MacCuillidman, of Cashel, and his scribes at the end of the 9th century. It was transcribed by Giolla Iosa Mor MacFirbis, and from this O'Donovan translated and annotated it. He also wrote a long and learned introduction to it under these heads:—"Of Leabhar na gCeart," "Of The Saltair Chaisil," "Of The Will of Cathaeir Mor," etc., "Of Tomar, King of the Galls of Dublin," "Of the Geasa agus Buadha Riagh Eireann," or the privileges and prohibitions of the Kings of Ireland; "Of The Divisions of the Year Among the Ancient Irish," "Of Chess," etc., "On The Irish Text and Translation," "On the Chariots and Roads of the Ancient Irish." The notes, as in all his works, are copious and clear, and he added an Index.

William Elliott Hudson, who superintended the work as it passed through the press, in acknowledging the services of the various persons concerned in its production, paid special tribute to Eugene O'Curry, "whose intimate knowledge had been made available," and to John O'Donovan, "pre-eminently for the learning and zeal which he has exhibited in the editing and general arrangement of the work. In it will be recognised a further proof of the critical and profound knowledge which he possesses of the language of our country, as well as its topography and history."

For the same society he also edited the "Genealogy of Corca Luighe," or O'Driscoll's Country; Gilbredhis MacComins' Poem on the "Battle of Down," 'and others, with usual translation. These were from the "Books of Lecan and of Ballymote." Then there was likewise the "Genealogy of Ossorian Family," "The Inauguration of Cathal Croudey O'Connor," and, in fact, it is marvellous the amount of work which he produced, besides which he was, with his amiable disposition, ever ready and willing to help other workers with his pen, as if he had nothing else to do.

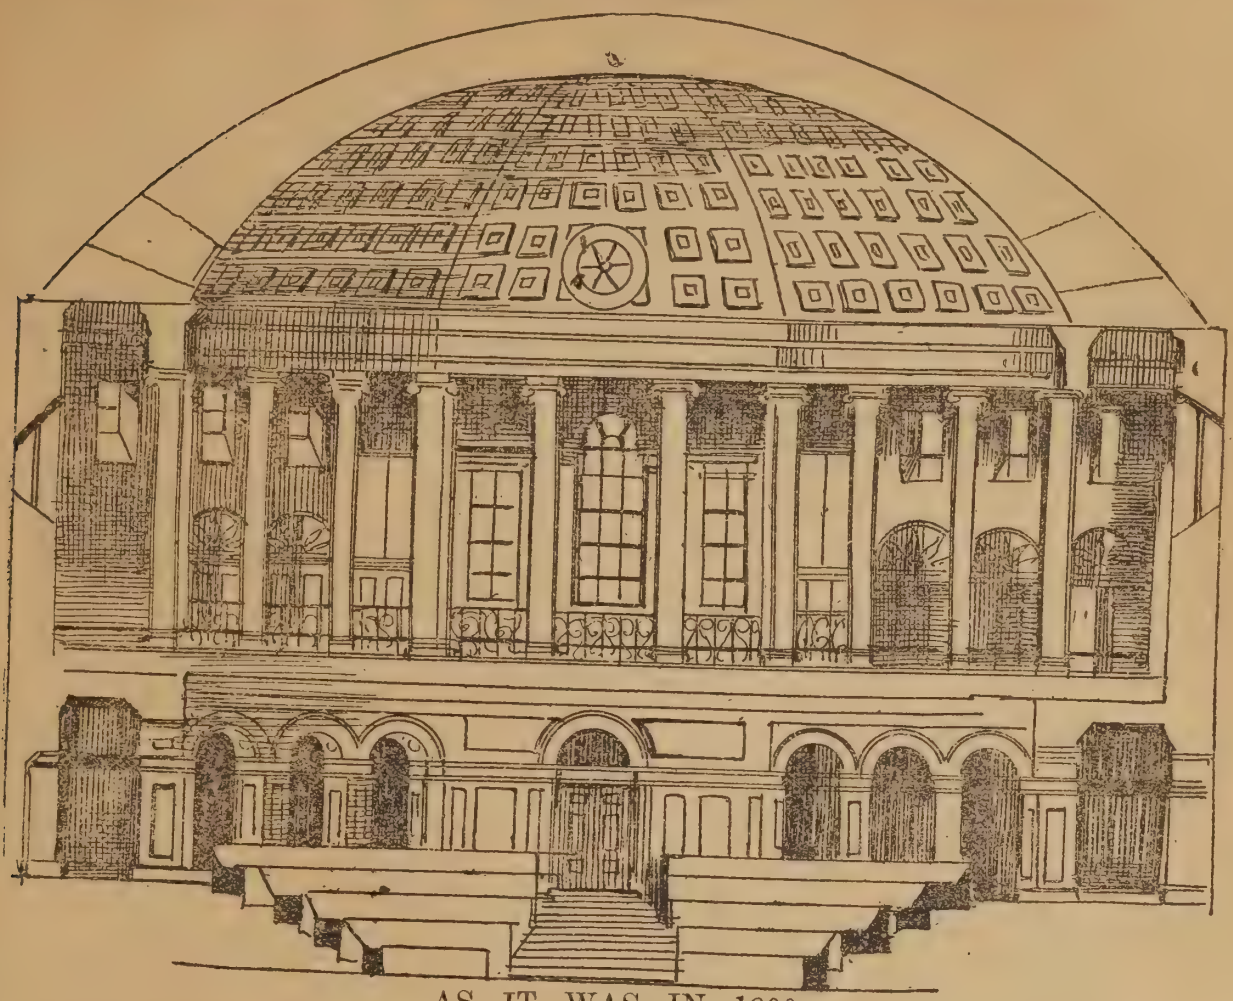
He also contributed articles on divers antiquarian subjects to the "Ulster Archæological Journal" for the Ossianic Society' among which was one on "The Physical Characteristics of the Ancient Irish." In this he quotes from a French author who visited Ireland in the reign of Diarmaid MacMurrogh, alluding to their nimbleness and swiftness, and again from Froissart:—

"Ireland is one of the yoele countries of the world to make war upon or to bring under subjection, for it is closed strongly and wydely with high forests and great waters and mareshes and places (un) habeytable; it is hard to enter to do them of the country any damage. . . . For a man of arms beying never so so weli horsed, and ran as fast as he can, the Yrisshemen wyll ryn afote as faste as he and overtake hym, yee, and leap up upon his horse behynd hym, and draw hym from his horse."

(To be continued.)

O SINGING HEART.

O singing heart, O singing heart!
Thou wilt not let thy mirth depart,
Though chilled by want, though pierced by pain,
But, like a robin in the rain
While angry skies conspire together,
Mak'st thy own clear and sunny weather.



O singing heart, I heard thy song;
The day was drear, the hours were long,
But thou, brave heart, didst win the day
From sodden turf and clouds of grey;
The sunshine like an echo sweet,
Followed thy song with flying feet.

O singing heart, shall I complain?
Thy laughter wakes a sweet refrain
In my sad bosom: glad and free
I'll tune my harp and sing with thee.
Love, hope, shall keep the bosom warm,
And these shall yet outsing the storm.

WORDS FROM INDIAN TONGUES.

At the International Congress of Americanists last October, Dr. A. F. Chamberlain described the contributions of the Algonkin Indians to the spoken and written English of America. More than 130 of our words, he said, had this origin. Among the more common of these words were chipmunk, hickory, hominy, mugwump, powwow, raccoon, skunk, squash, Tammany, terrapin, toboggan, totem, and woodchuck.

INTERIOR OF THE HOUSE OF COMMONS,

AS IT WAS IN 1800.

THE

IRISH PARLIAMENT HOUSE, COLLEGE GREEN.

THE HOUSE OF COMMONS.

WHAT IT WAS ONCE LIKE.

(From the "New Picture of Dublin," 1821.)

While appropriated to its original purpose, the Irish Parliament House was considered the finest senate-house in Europe. It was commenced in 1729, under the administration of Lord Cartaret, and completed in ten years, at the expense of near £40,000. The work was carried on under the inspection of Sir Lovet Pearce, engineer-general, until his demise, and was finished by Arthur Dobbs, Esq. It is situated in College-green, and placed nearly at right angles with the west front of the College, giving a grandeur of scene to that fine area scarcely surpassed in any city of Europe. It is built of Portland stone, and the grand portico in College-green extends 147 feet. It is of the Ionic order, and though destitute of the usual architectural decorations, derives all its beauty from a simple impulse of fine art, and is one of the few instances of form only expressing true symmetry. The interior fully corresponds with the majesty of its external appearance. During its former destination, the middle door under the portico led directly to the House of Commons, passing through a great hall called the Court of Requests. The commons-room formed a circle, 55 feet in diameter, inscribed in a square. The seats were disposed around the room in concentric circles rising above each other. A rich hemispherical dome supported by sixteen Corinthian columns, crowned the whole. Between the pillars, a narrow gallery was conveniently fitted up for the convenience of the public. A beautiful corridor communicated by three doors with the committee-rooms, coffee-rooms, etc. The House of Lords, to the right of the Commons, is also a noble apartment, ornamented at each end with Corinthian columns. An entablature goes round the room, covered with a rich trunk ceiling, and in a circular recess at the upper end was placed the throne of the Viceroy, under a rich canopy of crimson velvet. In 1785 it was determined to give a distinct entrance to the House of Lords, which was speedily executed by Mr. James Gandon, who erected a noble portico of six Corinthian columns, covered by a handsome pediment. The two porticos are connected by a circular screen wall, the height of the whole building, enriched with dressed niches and a rustic basement. An entrance was afterwards made on the western side from the designs of Mr. Robert Parke. It was completed in 1794. The expense of these additions was upwards of £50,000.

The late House of Lords, which remains unaltered, is now designated the Court of Proprietors. It is 73 feet long by 30 broad, and the walls are ornamented with two large pieces of tapestry, representing the battle of the Boyne and the siege of Londonderry, in a state of excellent preservation. At the upper end stands a statue of his late Majesty in his Parliamentary robes, admirably executed in white marble by J. Bacon, jun., of London, at the expense of £2,000. The pedestal on which it stands is ornamented with figures of Religion and Justice. There is also a fine bust of the Duke of Wellington by Tremcuille. The whole of the building, including court-yards, covers one acre, two roods, and thirteen and a half perches of ground; and on the roof, which is for the most part flat, a regiment of soldiers might be drawn up in time of danger.

THE MUSIC OF THE GAEL.

ITS SPECIAL CHARACTERISTICS.

By Rev. RICHARD HENEBRY, Ph. D.

III.

Edward Bunting, who compiled a valuable collection of Irish music and convened the last meeting of harpers in Belfast in 1792, says in his last volume, p. 73: "Hempson was the only one of the harpers at the Belfast meeting who played the harp with long crooked nails as described by the old writers. In playing he caught the strings between the flesh and the nail, not like the other harpers of his day, who pulled them by the fleshy part of the finger only. His fingers lay over the strings in such a manner that when he struck them with one finger the other was instantly ready to stop the vibration, so that the staccato passages were heard in full perfection. When asked the reason of playing certain parts of the tune in that style his reply was, 'That is the way I learned it' or 'I cannot play it in any other.' He was then 97 years old, the last representative of the old Irish school of harpers." Hardiman says in Vol. I., p. 181:—"The strains of Patrick Quinn, an old Irish harper, who performed publicly in Dublin in 1809, are still remembered with delight." The harp at present in the Library of Trinity College, Dublin, was played in the streets of Limerick by a man named O'Neill in 1760. He died in 1818. Indeed, two harpers, the last survivors of a school started by Bunting and others in Dublin about 1800, played in my own village of Portlaw in 1860. And now the art is irrevocably lost. And even the Irish bagpipes, the very last Irish musical instrument, is so despised, and has become such bad form that, but for the happy revival now afoot, it must have ceased to exist within the next few years. I leave to psychologists the following puzzle—How is it that this people, contrary to the use of all other nations, have come to be so that the more a thing is their own, the more it is a special outcome and product of the mind and usage of this race, the more a thing has been hallowed by the touch of their fathers and worn by their fingers, be it thought, tradition, language, literature, poetry, art, music, things of the hearth and the household, the soul and life-spirit of a nation for which all other peoples shed their blood; how is it that the more a thing is thus their own the more this people despise it and regard it as the very dirt? Whoso knows what they have swapped and see the return must bitterly deplore that villainous traffic.

Another evidence of the skill of the old Irish in music is the great body of melody at present in existence either published or still sung, played, or whistled by the people. With them the application of music was almost co-extensive with that of language. There were songs for the wake and for the funeral, songs of the boatman, of the smith, of the milkmaid, of the mower, spinning and weaving songs, lullabys or cradle songs, hunting songs, ploughmen's whistles, besides a wonderful variety of love songs and narrative or ballad airs. The list is practically inexhaustible. There was a corresponding variety in dance music. I can recall three of the tunes that had each a special dance. They were "The Act and Deuce of Pipering," "The Job of Journey-work" and "The Blackbird." There were hornpipes, called also trebles, there were doubles (in 6-8 time) and singles. There were four-hand reels and Scotch reels, jigs and hop-jigs, and such special steps as that called "cover the buckle" which was danced over a stick laid on the ground and was evidently a relic of the old sword dance. It is usual with the ignorant to call all Irish dance tunes "jigs." How much they are mistaken the foregoing list will show; for a jig must be in 9-8 time and have a certain cadence.

For myself I was brought up between two languages and two systems of music. According to my personal tastes, therefore, I am qualified to deliver judgment on both Irish and modern music. My cradle song was in Irish, but since then I have heard some of the world's best vulgar music. Passing over a good deal I have time and again listened to the incomparable fiddling of Herr Joachim, the very highest expression of instrumental music now in existence. Then establishing a rough standard, I shall regard music as analogous to language and its supreme function the conveying of ideas through the medium of emotional expression. Measured by this standard, I think, all prejudice apart, that Irish music is incomparably superior to any other I ever heard. It gives a better imitation of natural sounds that to us are inseparably linked with specific meanings, such as the cry of sorrow, the wail of despair, the shout of joy, the soughing of wind through a door, the storm song of pine-trees, or the rhythmic rattle of a locomotive. That music is for me the more intimate voice of the human soul, it is the complement of language and gives expression to a whole host of subtle subjective states that utterly transcend the power of words. In comparison with it modern vulgar music is as dumb, inarticulate and motiveless as the babbling of children.

Now, let one hear a modern orchestra or a solo singer or any form of vulgar music, and compare it with the playing of an Irish street fiddler or piper, or a ploughboy whistling for his team, or a girl singing to her cow, or an old woman croning a tune, and the difference in rhythm, in expression, in tone-colour, is at once apparent. This difference is the motive of my "voluptuous digression" on the question of music. It is due to a threefold cause that reaches the very fundamental essentials of all music. That is to say:

1. Differences of scale.
2. Differences of keys or tonics.
3. Differences of accent and phrasing.

1. Differences of scale.—Irish music owes its peculiar tone to the scale on which it is composed. There are certain infinitesimal variations from the modern scale, but though slight, they give the colour anl character to Irish music. This question has been examined by Prof. O'Sullivan of the Queen's College, Cork, and published in his introductory volume to O'Curry's "Manners and Customs." Nobody else has ever worked at the problem, although his valuable study has been before the public these twenty years. He discovered that Irish music is composed on the old gapped quinque grade scale built on a chain of fifths. By reason of its constitution it often differs from the modern scale in length of interval. In primitive times the octave comprised only five notes, thus:

1-2x4-5x7-1

Here - represents a tone interval, x a gap of a tone and a half. It will be noticed that the 3rd and 6th notes are wanting. These lacunae were filled later by the insertion of semi-tones under the influence of Gregorian plain-song. Also there is a full tone between the 7th and the octave. That is the "flat 7th" of modern musicians when discussing Irish music. There are only two kinds of interval, viz., tone and tone and a half. Compare the modern scale which would be:

1-2 | 3 .: 4-5 [6-7 :. .:1.

Here there are eight notes with three classes of interval, viz., major tones represented by - ,minor by | and semi-tones by :. It will be seen that the two scales are absolutely incommensurable, and hence, music composed on one cannot be played in the other. Hence, the piano, flute, or concertina, or any instrument tuned rigidly to the modern scale, cannot play Irish music.

2. Differences of keys. Modern music has practically only one scale and the key signature merely indicates that it is played so many tones or semi-tones higher or lower. In Irish music there are five scales, constructed by regarding each note of the scale in turn as the tonic and proceeding from it up to the octave. This was feasible in the Irish scale where each tone was independent of the others. Of course the resulting scales were all different from each other because the gaps occurred in different positions. Thus:

1-2x4-5x7-1
2x4-5x7-1-2
4-5x7-1-2x4
5x7-1-2x4-5
7-1-2x4-5x7

By inserting semi-tones in the gaps of the last scale the character is altogether altered; and thus a player ignorant of a particular musical system makes havoc of its phrasing. Irish music was phrased and accented differently from modern music. I will merely quote what I have already said on this matter: "To me there is nothing so wholly discomposing as listening to an Irish air sung with all the saccharine expression of the vaudeville stage to a jangling piano accompaniment. When I compare the wrong tone-scheme, the bad phrasing, the pert, exaggerated, hysterical, and false expression with the traditional version of the same air as sung by an old woman, with its full, rich intervals and simple feeling, the veritable voice and refrain of the Gaelic heart, the contrast between modern sham and Celtic truth becomes too poignant for my equanimity."

Music is as much a part of our civilisation and nationality as language, and therefore, must be preserved. For the present our only hope is to learn it from its traditional custodians and shun all contact with the modern scale.

(The End.)

MY HARBOUR DOWN IN GALWAY.

BY J. J. DOLAN.

I listened to an argument on harbours recently. The disputants were from Dublin, Cork, and Galway towns in Ireland, a Leith Scotchman, and a New Yorker. They all argued for the harbour merits of their respective localities. After a time the persistency of the Galway man angered the rest, and they combined to belittle his harbour. When they had apparently overpowered him he turned and said: "Boys, you may say what you will, but there's no place like home." Silence prevailed in the group. Each and all must have thought as Galway did, and may God forbid that any worldly condition should be strong enough to deprive men of cradled memories.

A riding stream they have at Cork
A Bay, at Dublin alway,
An ocean entrance to New York,
But a harbour down in Galway.
Though Scots may raise their voice in song,
And boast their friths and Solway
In love of home there's nothing wrong
That's why I sing for Galway.

My birth was near the pleasant place,
And when I'm in the pall way
I hope the Good will give me grace
To rest my bones in Galway,
The humble cot I called my home
Had neither tower nor hallway,
Yet none is good from here to Rome,
My harbour was in Galway.

Good luck attend your homely wit
That knew no bar nor toll way
For loving what was in you knit
Your humble home and Galway.
There never was a place like home.
Denial marks a thrall way.
If I were there I'd never roam
So far from dear old Galway.

THE ANCIENT AND PRESENT STATE OF THE COUNTY AND CITY OF CORK.

By CHARLES SMITH, M.D.

Æquum est enim meminisse & me, qui discerem hominem esse et vos, qui Judicetis ut ñ probabilia dicentur nihil ultra requiratis.

VOL. I.

The Second Edition, with Additions.

Chapter VI.—Continued.

Five miles S. of Charleville is Annagh, a pretty, thriving village on the estate of the Earl of Egmont; this place, with a large tract of the adjacent land, were, at a very great expense, reclaimed from a deep and dangerous morass, now pleasantly planted and well improved, large drains and canals being cut through the morass, which empty themselves into a branch of the river Awbeg. Here stood a strong castle that, in the wars of 1641, was for years garrisoned at the expense of Sir Philip Perceval, Bart., and, by its situation in the midst of a bog, was deemed impregnable; but it was at last taken, anno 1645, by treachery, and the whole garrison put to the sword, in cold blood, by order of the Lord Castleconnell, who then commanded the Irish army, consisting of 5,000 horse and foot, and who was an inveterate enemy to Sir Philip Perceval, because he had refused to give him his daughter in marriage before the war. This castle was demolished by the late Earl of Egmont, who drained the ground, built the village of Annagh, and established the linen manufacture therein.

Church-town is a small village, prettily planted; in it are the ruins of the old church, called Bruhenny. In the 9th of Queen Anne, an Act of Parliament was obtained by the late Earl of Egmont for removing the site of this church. The new church is a good building, in form of a cross; the chancel is paved with black and white marble, the produce of this country: in this chancel is a vault where several of the house of Egmont are interred.

Burton, near Church-town, was formerly a noble seat of the Perceval family, burned down in the late wars by the same party of King James's forces who burned Charleville. The plantations and improvements are very beautiful and extensive. Here are large orchards, and a noble park. The walls of the house still remain, which show it to have been a large, elegant building, mostly of hewn stone. From Burton to the new parish church there is an handsome avenue, well planted; this place gives title of Baron to its owner, the Right Hon. the Earl of Egmont. The manor of Burton is very large; all the land within it, as well as the royalties, belong to the same nobleman. It would be tedious to enumerate the smaller districts which depend upon, and were incorporated into a kind of honour, by King Charles I. in favour of Sir Philip Perceval, in the year 1637, with the privileges of court baron, court leet, free warren, and all other pre-eminences and royalties under the manor of Burton, which likewise comprehends the castle and manor of Annagh above-mentioned. This patent also grants fairs and markets to the town of Bourton.

Near Burton is Egmont, which gives title of Earl to the same family. Here was formerly a castle, built by the Barrys several centuries ago; in the wars of 1641, it was fortified and garrisoned, at the expense of Sir Philip Perceval, but was taken by the Irish in 1645, with the rest of his castles. And more easterly, on the river Awbeg, is Ballinguile, a good house of Mr. Freeman, with large orchards and numerous plantations; this house was built on the foundation of an ancient castle of the Stapletons, erected soon after the reign of King John.

Buttevant, called in the ecclesiastical books Bothon, by the Irish and Spenser Kilnemullagh, was formerly an ancient corporation, being once governed by a mayor and Aldermen, but by the wars gone to decay; and it is said to have suffered greatly in the last plague of Ireland. There are still to be seen the remains of a wall that surrounded the town; and they also show the traces of an outward wall, which enclosed the other, and took up a considerable circuit of ground. In this place are the remains of a sumptuous ruin of the ancient abbey of friars minors, founded by David de Barry, in the reign of King Edward I., who lies buried therein; he was Lord Justice of Ireland, and his tomb still remains in the choir, opposite the great altar. The walls of the choir, with the nave of the church, and several other buildings, remain entire; also the steeple, which is an high square tower, erected on a fine gothic arch; to the south is St. Mary's chapel, in which are several tombs of the ancient Irish families, viz., the Barrys, the Magners, Fitz-Geralds, Prendergasts, O'Callaghans Donegans, Meads, Dowlings, and Healys. In this chapel are the remains of an altar and two others, in the nave of the church on each side of the choir; in which are other tombs of the Barrys, Nagles, Lombards, and Supples. Beside the above-mentioned tombs, there are others of the Coghlans, MacAuliffs, and O'Kiefs.

On the N.W. side of the abbey stands a ruined tower, said to have been erected by an Earl of Desmond, who retired here; they call it Cullin. On each hand of the W. entrance of the abbey are two huge piles of skulls, which some say were brought hither after the battle of Knockninoss, and was fought but five miles from hence. Near this abbey stands a part of another ruin, said to have been a nunnery, dedicated to St. Owen, or, according to others, to St. John Baptist. The name Buttevant, according to tradition, takes its rise from a word given in a battle fought near this place by David de Barry, who here overthrew the MacCartys, and cried out "Boutez en vant," i.e., "push forward," which is the present motto of the Barrymore family, who take title of Viscount from this place. To the east of the town stand the ruins of the Lord Barry's castle, boldly and strongly erected on a rock over the river Awbeg; the inside of this building forms an octagon, and was no inconsiderable fortress before the present art of besieging places was discovered. Somewhat more to the E. stands the church, which is a modern structure; but the ancient remains of two churches, one dedicated to St. Bridget, and the other to the Virgin Mary, are still visible, both having stood in the same church-yard, which is very uncommon. There are also the ruins of a chapel of ease at Spitle-Bridge, one mile east of Buttevant; this whole town formerly seems to have been an assemblage of churches and religious houses, which being dissolved, consequently went with them to ruin; so that these lines of Mr. Pope may be now justly applied to this place:

The levell'd town with weeds lies cover'd o'er,
The hollow winds through naked temples roar,
Round broken columns clasping ivy twin'd,
O'er heaps of ruin stalk'd the stately hind;
The fox obscene to gaping tombs retires,
And savage howlings fill the sacred quires.
Windsor Forest.

This town belongs to the Earl of Barrymore; and the new turnpike road from Cork to Limemrick runs through it. Near Kilmacglenine, two miles S.W. of Buttevant, there is a pit of good yellow ochre used for painting. At Ballybeg, on the other side of the river, a small walk from Buttevant, was a monastery of Augustinians, founded anno 1237, and dedicated to St. Thomas by Philip de Barry, being endowed by his son David, who founded the friary of Buttevant, before mentioned; this house and its revenues were granted to Sir Daniel Norton, Knt., in trust for the Lady Norris, wife of Sir Thomas Norris, Lord President of Munster, and mother to the Lady Jephson, wife to Sir John Jephson, who passed a patent for the same. The lands belonging to this abbey contained 2,060 Irish acres, and, by a valuation taken in 1622, were only worth £60 a year; at the same time, the tithes and glebes belonging to it were valued at £200 per ann. more. Some part of the building, particularly the steeple, which was a strong structure, and the east window of the chancel, have outlived the injuries of time. By the holes which remain in the vaulted roof of the steeple, there were here a chime of bells. The traces of the foundation, and an high tower, detached a considerable way to the S.W.,

once a part of this fabric, show it to have been a very large and magnificent structure.

Five miles W. of Buttevant stand the ruins of the castle of Liscarroll, near which, on the 3rd of September, 1642, was fought a battle between the English, commanded by the Lord Inchiquin, and the Irish, under the Lord Mountgarret and other generals, where was slain the valiant Lewis, Lord Viscount Kinalmeaky, Governor of Bandon, and son to the first Earl of Cork. But the victory fell to the English, with the slaughter of 1,500 of their enemies. This battle was fought to the W. of the castle, in which Sir Philip Perceval, before mentioned, kept a garrison for several years at his own expense, and raised many outworks about it in the modern style of fortification. In August, 1642, it was besieged by a regular army, consisting of 7,000 Irish, who, after a very gallant resistance of 13 days, obliged it to surrender. The day following, Lord Inchiquin, coming up with the English army, defeated the Irish, as is above mentioned. The Irish again besieged it, anno 1646, with an army of 5,000 foot and 500 horse, commanded by the Earl of Castlehaven, who then took most of the strongholds in this country, Lord Inchiquin for want of supplies being then obliged to stand upon the defensive. The news of Castlehaven's success had such an effect, that this castle, which had been before so well defended, surrendered without firing a shot, though then in the best posture of defence, and commanded by the same officer, one Captain Raymond, who had defended it so gallantly during the former siege, and who, for his cowardice or treachery, was condemned to be shot, together with another steward of Sir Philip Perceval; but, by his indulgence, they were pardoned. This castle is a parallelogram, or oblong square, of 120 by 240 feet; it was flanked by six great towers, two square and four round; the gateway, which faced the S., was defended by a strong castle, from which, on either hand, were the apartments; the walls were 30 feet high. This castle is said to have been built by King John; it was, at least, erected by some of the Strongbonian adventurers. It was for many years possessed by the Barrys, before it belonged to the Perceval family: Sir Hardress Waller recovered it from the Irish, anno 1650; the breach made by him is still visible, near the S.W. tower, and it has ever since remained in a ruinous condition. This castle has effectually suffered from the loyalty of its inhabitants; the ruins of its several turrets, and other works, afford the imagination a more pleasing idea than the most magnificent structure could well do; as one looks on the wounds of a veteran with more veneration than the most exact proportions of a regular beauty, and as these ruins call to mind the devastation caused by our intestine troubles, the history of those particular places is naturally sought after.

At a place called Kilabrahar, i.e., the church of the brotherhood, was a ruined monastery, but of what order is uncertain; it stood between Church-town and Liscarroll. At Lisgriffin, on the Earl of Egmont's estate, two miles west of Buttevant, several crystals have been found of the Kerry-stone kind; this castle was built in the beginning of King James 1st's reign by one Garret Barry.

A vast extended plain high mountains bound,
Where rapid torrents from each rock resound,
The north, fair Orrery's bleak hills divide
From Limerick's fertile strand, and Shannon's tide;
The eastern border Ballyhowra steep
Proudly impends, and lofty Galtys sweep;
St. Hilary's holy range the south defends,
From deluges th' Iberian ocean sends:
The Paps (5), the Reeks, the Mangerton, not least
Of European mountains, to the west,
With gradual progress rising, horrid stand,
And in one view near half the isle command.
Beneath this tow'ring coast collected rains
With hasty emulation seek the plains:
And new born rivers from their gloomy birth,
Impatient break upon more fruitful earth:
Where fondly gladden'd with the pleasing scene,,
They stay their fury, and enjoy the green.
Thence Aviduff (6) to Youghal's spacious bay,
In hollow murmurs takes her circling way:
And Allo (7), by fam'd Spenser stil'd the strong,
Impetuous from her mountains rolls along.
Kanturk's proud ruins, softens in her course,
And joins her sister, but with half her force.
While gentle Mulla (8), his one favourite theme
Records his muses truth in her slow gliding stream.
Along each precipice by ev'ry flood,
Each craggy brow, and cavern fring'd with wood,
The pine and oak in mighty forests rise,
And crown the mountain tops, and touch the neighb'ring skies.
The vale beneath in wide enamel'd fields,
The earth's best treasure to its owner yields.
What though each craggy boundary contains,
Or beds of copper, coal, or richer veins;
Their flinty bowels mock the miners toil,
The surest riches are a fertile soil,
Where honest labour crown'd with certain wealth,
Brings cheerful innocence, content and health,
The infant year in high grown verdure gay,
Conceals the herds which in their pastures stray.
Their gentle zephyrs summer's heat asswage,
Confess his power, but subdue his rage:
Potent to cherish man, and to adorn,
But impotent to scorch the golden corn,
The sultry dog-star, prone to good and ill,
Has leave to exercise but half his will:
Subservient only to peasant's joy,
Allow'd to bless, forbidden to destroy.
E'en savage winter with his hoary face,
Visits this land with less imperious pace;
Fearful the azure heavens to deform,
Behind the distant hills he leaves the storm,
Where unrestrain'd, the ratling thunder's roll
Shake the firm earth, and rend the vaulted pole;
Thus freed from nipping frosts, and chilling blasts,
The variegated verdure ever lasts.
And here the feather'd choir incessant sing,
Chear'd by the beauties of eternal spring.
In this blest station many castles stand
To awe the rebel and protect the land;
Whose high aspiring towers from afar
The pristine grandeur of their Lords declare.
Kanturk, already nam'd, once rais'd too high
To bear suspicious Albion's sovereign eye,
In haughty fragments of unfinish'd state,
Proclaims the cause of her untimely fate.
Liscaroll next in six tall flankers strong,
(A melancholy object of our song)
Gives its own title to the neighb'ring plain
Ennobled by itself, and Kinalmeaky slain.
From hence the eye directed to the right
Brings Annagh's verdant island to the sight;
Which once encompas'd by a deep morass,
Secur'd the flocks high bounding on her grass;
A mighty bulwark on the border stood
To guard the passage of the miry flood,
Impervious, but by one long trembling way
Of yielding wattles spread on sinking clay,
Which far remov'd from any solid shore,
Defy'd the heavy cannon's distant roar;
The elevated bolts still fell too low,
Nor hurt her ramparts with one feeble blow.
Hence not far distant Burton's groves appear,
Where pines and elms in artful order rear,
Where wand'ring eyes with secret pleasure gaze,
Where bow'rs, and lawns, and crystal rills amaze,
Where sylvan gods disport the live-long day,
And wanton fairies dance the night away.
Next Egmont comes in view, Trinacrian height,
High-rising emblem of its owner's state;
Egmont, which gives to the illustrious race
The highest honour, and the senate's place.
'Twas here, if old tradition's tale be true,
When tyrant Denmark's lordly sons withdrew,
Compell'd by Boirou's arms to fly the land,
They hid their ravish'd plunder in the sand;
Where long committed to the faithful earth,
Ten centuries have yet deny'd them birth;
And yet uncertain lies the shining ore,
Condemn'd, perhaps, to see the sun no more.
And now the muse a distant tract surveys,
So rich, so vast above the muse's praise.
Here rooted to the earth, great Loghort stands
A mole enormous, fam'd in foreign lands;
Founded in justice and a pious cause,
Remains a monument of heaven's applause.
For when the English chiefs invaded first,
The wanton isle in impious riot curs'd,
By them erected this stupendous tow'r,
Right to support, and quell the factious pow'r;
For many ages constant to this end,
This mighty fortress did its plains defend.
In later times, when arms the land defac'd,
A chosen band by its great master plac'd,
Long kept this station, and unshaken stood,
Amidst the storm of war, and tide of blood,
Till false security betray'd the guard,
And one vile miscreant, for a mean reward,
Its maiden state defil'd, and basely sold;
Such the resistless force of all-alluring gold!
But Waller Loghort's rebel power shook,
And from her savage sons the post retook.
Here stay'd the muse, and on her summit sat,
Admir'd her magnitude, her strength, her state.
Deep in amazement ran the prospect o'er,
Such as her eye had scarce e'er seen before.
Beheld immensely high from ev'ry side,
The most luxuriant force of nature's pride:
In vain attempted to survey the land,
And mark each beauty of the high command;
Though more than mortal, yet the visual ray
Travell'd unbounded o'er the wondrous way,
Still wander'd on the yet unfinish'd sight,
And lost itself in atmosphere and light:
Where the blue firmament confounds the green,
And hazy vapours close the rapt'rous scene.

This barony gives title of Earl to the Right Hon. Edmund Boyle, Earl of Orrery, whose ancestor, Roger, Lord Broghill, was so created, September 5th, anno 1660, in consideration of his services in restoring King Charles II., as is expressed in his Lordship's patent of creation; on the 5th of February following, he was made Lord President of the Province of Munster, and in October, 1660, was declared one of the three Lords Justices for the government of this kingdom.

(To be Continued.)

(5) Those are in Kerry.

(6) Spenser's name for the Blackwater.

(7) Spenser makes this river tumble from the mountains of Slewlogher; but they are some miles distant from any part of it.

(8) The Mulla of Spenser, is the river Awbeg, in this county.

ONE OF THE WONDERS OF FRANCE.

Mr. E A Martel, the celebrated explorer of French caverns, has lately been explaining, before the Academy of Sciences, the remarkable variations in the flow of the great natural fountain of Vaucluse. This fountain, which has been famous for ages, and is connected with the romance of Petrarch and Laura, excites the admiration of all travellers. Arthur Young visited it during his travels in France on the eve of the great revolution, and gave a delightful sketch of it in his book. The fountain is so abundant with water that it gives rise to the Sorgue, a small river. Mr Martel says, in fact, that the fountain is the debouchment of a river, which, in the upper part of its course, flows entirely under ground; and he explains the curious irregularities in the quantity and temperature of the water by certain assumptions as to the shape and size of the subterranean cavities that give it passage.

ROYAL IRISH ACADEMY.

THE ANNUAL MEETING.

The annual general meeting of the members of the Royal Irish Academy was held on Monday, 16th instant at the Academy House, Dawson street, for the election of President, Council, and officers for the ensuing year; to receive the report of the Council for the year 1902-3; for the election of members, and of two representatives of the Academy on the Board of Visitors of the Science and Art Museum, etc., in the room of Professor E. Perceval Wright, M.D., and Mr. J. Ribton Garstin, D.L.

The President, Professor Robert Atkinson, LL.D., occupied the chair.

The report stated—The Council regret that the question of the custody of the gold ornaments found in 1896 near Limavady has not yet been decided. But the action of the Crown against the British Museum, in respect of these ornaments, is listed for the present sittings in the Chancery Division of the High Court of Justice, and the Council have reason to hope that it will come on for trial before Whitsuntide. The entire text of the Book of Armagh is now printed off, and the editor is engaged at the preparation of the introduction and appendices, which he hopes to be able to complete before the close of the present year. In the preparation of the Irish Dictionary the editor reports that the work of dividing out the slips has been carried on steadily and continuously during the past year, and has now advanced to the letter N. It is not contemplated to undertake the preparation of any more slips, save in cases where special researches may be found indispensable. An important change has been made dur ng the past year in the method of publication of the transactions and proceedings of the Academy. The Publication Committee, having felt for a considerable time the practical disadvantages of the system of publishing all the papers together in an unclassified form, very carefully considered the whole question. Accordingly, after full consideration, the Committee recommended the Council to publish henceforth the transactions and proceedings of the Academy respectively in three different sections, viz.—(a) Mathematical, Astronomical, and Physical Science; (b) Biological, Geological, and Chemical Science; (c) Archaeology, Linguistic, and Literature, which suggestion the Council adopted. The Academy has lost by death within the year four members and two honorary members in the Section of Science—viz., Sir George Gabriel Stokes, Bart., and Rudolph Virchow. The library has, as usual, received a number of works on Irish subjects through the kindness of their authors. Among these may be mentioned Mr. C. Litton Falkiner's "Studies in Irish History," Mr. Temple Scott's edition of the works of Jonathan Swift, Rev. J. P. Rushe's "Carmel in Ireland," and the Rev. P. S. Dineen's selections from authors who have written in the Irish language. Noteworthy additions to the library have been made by Rev. Maxwell H. Close, who has given some twenty-four works on Irish subjects, besides other important books on architecture and Celtic philology. Special mention should be made of Mr. Close's gift of drawings of Irish Antiquities, which formed the basis of the illustrations to Grose's "Antiquities of Ireland," published in 1795. These are now being arranged for binding in one volume. With the greatest regret the Council have to notify to the Academy that they have received from the Rev. Maxwell Close an intimation of his wish to retire from the office of Treasurer of the Academy. All the gold objects in the museum are now definitely arranged, and labels added to each object of importance. The collection of celts is brought into a more compact space, and the arrangement, by types and finds, more systematically carried out. The case in which the spears and daggers are exhibited is very interesting, as the development of the spear from the dagger is well illustrated by the arrangement, the transitions being clearly marked—probably better marked than in any other collection. The Committee are of opinion that there is great need of a detailed catalogue of the museum, and would suggest, more especially, that a separate descriptive work on the shrines—the chief of which are now deposited in the museum—should be prepared and fully illustrated, as it would certainly meet a demand and be much appreciated by those interested in Irish archaeology.

Professor Purser proposed, and Professor O'Reilly seconded, the adoption of the report.

Dr. Douglas Hyde said he would like to know how far the work of arranging the Irish manuscripts in the Academy had progressed during the year. He would like to have seen some reference made to that matter in the report.

The Chairman observed that that was not the time to raise the matter, the question before them being the adoption of the report.

Mr. Garstin said he was sure they all regretted the retirement of Rev. Maxwell Close fro mthe office of treasurer of the Academy. On that occasion it was meet that they should express the great obligation the Academy was under to Mr. Close for his valuable services to the Academy, extending over a period of twenty-five years, and their regret at his resignation. He hoped that those present would join with him in placing on record their deep sense of the valuable services rendered to the Academy by the Rev. Maxwell Close during his term of office as treasurer of the Academy.

Rev. Father M'Inerney said he had great pleasure in seconding the resolution. Not the least of his reasons for doing so, was, as they were all aware, that Rev. Mr. Close never forgot that the Academy was an Irish Academy, and that it was devoted to Irish interests.

The President, in putting the report and resolution, said he considered it would be a neglect of duty on his part and also a failure in giving expression to his own personal feelings if he did not add a brief word of approval to what had been already said. He was sure that Mr. Close himself felt deep regret at the circumstances which obliged him to relinquish his post. Mr. Close might be sure that the feelings of the members of the Council and the Associates were strong in expressing their sense of sorrow in having to accept his resignation. He (the President) had come to regard Mr. Close as a permanent pillar of the Academy, and it was a great shock to him and to every member of the Council to know that he would have to give up his post. The Academy had never a more loyal and devoted servant (hear, hear), nor had Ireland ever a more loyal and devoted son. He felt certain that the report and resolution would be unanimously agreed to.

The report and motion was unanimously adopted.

ELECTION OF OFFICERS.

The following were elected as president and members of the Council for the ensuing year: President, Robert Atkinson, LL.D., Litt.D. Council—Committee of Science—Grenville A. J. Cole, F.G.S.; Charles J. Joly, Sc.D.; Joseph P. O'Reilly, C.E.; Francis A. Tarleton, LL.D., D.Sc.; Charles R. Browne, M.D.; Thomas Johnson, D.Sc.; Rev. W. R. Westropp Roberts, B.D.; John Joly, Sc.D., F.R.S.; R. Lloyd Praeger, B.E.; Robert F. Scharff, B.Sc., Ph.D.; William E. Wilson, Sc.D., F.R.S. Committee of Polite Literature and Antiquities—Rev. Maxwell H. Close, M.A.; Rev. Edmund Hogan, S.J., D. Litt.; Robert Cochrane, F.S.A.; Louis C. Purser, M.A., Litt.D; Most Rev. Bishop Donnelly, D.D.; C. Litton Falkiner, M.A.; Francis Elrington Ball, Henry F. Berry, M.A.; George Coffey, B.A.I.; Lord Walter Fitzgerald

NEW MEMBERS.

The following new members of the Academy were elected:—Walter Ernest Adeney, D.Sc.; George Herbert Carpenter, B.Sc. (Lond.); Rev. William Carrigan; Conolly Norman, F.R.C.P.I.; Rev. Charles Francis Knox Pooler, M.A., B.D. (Dub.); Reginald Arthur Percy Rogers, M.A. (Dub.), F.T.C.D.; Hugh Ryan, M.A., D. Sc.; William Edward Thrift, M.A. (Dub.); John Henry Wardell, B.A. (Dub.); and Gregg Wilson, M.A., D.Sc. (Edin.), Ph.D. (Freib.).

APPOINTMENT OF TREASURER.

It was unanimously agreed that Rev. Wm. W. Roberts be appointed to the position of treasurer, rendered vacant by the resignation of Rev. Maxwell Close.

SCIENCE AND ART MUSEUM.

Dr. Joly and Mr. J. R. Garstin, D.L., were elected to represent the Academy on the Board of Visitors to the Science and Art Museum. A hearty vote of thanks was accorded Professor E. P. Wright, M.D., who resigned his seat, for his services on the board.

Some matters of general business having been transacted,

The proceedings concluded.

CHINESE MAGIC LANTERNS.

The magic lantern, like porcelain, gunpowder, and printing, may have been an invention of the Chinese. For more than twenty centuries it has been a staple amusement in the Celestial Empire, and has been developed into many forms unknown to the occident. The Middle Kingdom, which has been well termed Topsy Turvy Land, uses the magic lantern in just the opposite manner from what we do, having the light and picture behind the screen, the same as in our parlour amusement of shadowgraphs. The commonest form of the magic lantern in the extreme Orient is a large box supported on a tripod or four-legged table. The box is about 4 feet wide by 2 high, and its front is made of ground glass, oiled silk, or oiled white paper.

Over the box is a light framework of bamboo and cloth which reaches to the ground and conceals the operator from the audience, but leaves the glass exposed to view. A powerful lamp in front of a concave reflector throws a strong light upon the glass or screen, as the case may be. The top of the box and the sides are half open to permit the introduction of small figures. This arrangement gives four distinct classes of instruments. With all four instruments the exhibitions are given in the streets, squares, and market places. They draw audiences ranging from five to thirty, and give an entertainment of from five to fifteen minutes in length. Each spectator is supposed to contribute 1 cash, or a twentieth of a cent. when the hat is passed around. Generous or enthusiastic patrons frequently give from 10 to 15 cash, so that the average performance nets the proprietor about 2 cents. This seems ridiculous to Europeans, but in a land where an able-bodied man can be hired for 5 cents. a day the owner of a successful magic lantern is looked upon as a very well-to-do individual.

The little plays which are written about the magic figures are as conventional as our own immortal Punch and Judy. The "wicked tiger" depicts the career of a dissolute animal who from killing pigs, dogs, and buffaloes, finally eats a beautiful maiden, and is slain by a Mongolian chief in full armour on horseback. "The wicked wife" forms a compact with the devil, squanders her husband's substance in riotous living, and, in the last scene, hangs herself in a blaze of red fire, while the evil one expresses wild joy in extraordinary Oriental gesticulations. "The cruel magician," "the grateful dragon," "the fairy foxes," and other bits of Eastern folklore afford brief sketches which are as familiar as household words.

SALE OF AN INTERESTING DUBLIN MANSION.

The trustees of Molyneaux Retreat, which has for many years past occupied the large old Dublin residence adjoining the Albert Chapel in Peter street, have succeeded in purchasing through the agency of Messrs MacArthur, of Talbot street, the large North Side Mansion in Eccles street, once the residence of the late Isaac Butt, Q C, M P. It occupies a double site, its unusual size and its front being ornamented with some well executed medallions of classical subjects makes it an object of interest to passers by.

LITERARY NOTES.

The Bacon-Shakespeare see-saw has not yet rocked itself to rest. "Is it Shakespeare?" is the title of a book to be issued next week by Mr. Murray. The author veils himself as "A Graduate at Cambridge," and his answer to his own question is "No." He bases his attribution of the plays to Bacon mainly on a study of the sonnets and poems, but we hear also of new revelations and new contemporary evidence.

✧ ✧ ✧

In the New York "Reader" for last month, we find an unusually interesting article on Schopenhauer. The writer, Mr. R. V. Risley, secured the information which he sets down from a man who knew Schopenhauer intimately for some months in Frankfort. Schopenhauer's mother was a sentimentalist, his father a grim and passionate man who voluntarily ended his life in a "black canal between two gloomy warehouses." After that the boy sat on a stool in the office of a Jew money-changer. When he grew up he went to Weimar to see his foolish mother, who had taken to writing mystical novels, "now," says Mr. Risley, "worthily forgotten." But an inevitable estrangement ensued, and as inevitably Schopenhauer fell in love; "it was characteristic of his whimsical and piteous bitterness that he should wilfully love below him." The woman's name is unknown—she was an actress; but from that point Schopenhauer's real career began. Yet for twenty years he remained unknown:—

Stumping along the narrow streets with his stick, a disordered sheaf of papers under his arm, he became a gibe with the cellar cheese-mongers and corner beer-sellers of the neighbourhood. With the delicate yellow of the afternoon sunlight patching the bowed and shiny back of his black coat in wavering squares of canary—through the flowing drifts of winter—with the flame-coloured autumn leaves fallen from trees overhead lying unnoticed on his shoulders—he walked unknown.

✧ ✧ ✧

It was only when the universities had begun to recognise Schopenhauer that the friend whom Mr. Risley names, Dr. Alan Read, first met the philosopher who "felt his thoughts." From the verbatim sayings of Schopenhauer, given by Mr. Risley, we quote the following:—

No man loves the woman—only his dream.

Fame? I prefer money.

It is less contemptible.

O, yes! I am perfectly willing to do anything which your morality decries—but even to be recalcitrant no longer especially interests me—save that it gives me my only amusement, the wonder of those who do not understand.

I am too tired to care for anything.

I have made one now unalterable mistake in my life—I have not been a fool. I wish to God I could be!

Laugh! Few things are worthy of seriosity—least of all an old man who sneers at the things of his youth begged for in silence.

Besides—the years flow over me like a wave—I am smothered. My brain is stunned with repetitionary detonations. The drums of memory are slack-headed as they beat the funeral farce-dirge of what I have never had—and from the land of to-morrow I hear the echo of a sunset-gun.

Life is only an old coat, by the casting off of which I would be eased—but I lack the bravery of cowardice—which requires less vanity than mine in order to be simple enough to put an end to existence.

Self-realisation kills laughter.

Besides—I am too tired.

The object of life? Having eliminated its joys and its reasons, could I find any object? Why, this glass of Moselle does more to tempt me to remain in life than do all my hopes—for I have so few—I am perhaps the only man in the world who has more expectations than hopes.

A year after the conversations recorded Schopenhauer died in his solitary lodgings. He was found sitting in his big chair, dead.

✧ ✧ ✧

Mr. Cutcliffe Hyne has achieved the distinction of being the subject of the "World's" seven hundred-and-eighty-third "Celebrities at Home" article. From it we learn that Mr. Hyne's early tendencies were towards athleticism rather than literature; "he was so good an oar as to be in the University (Cambridge) trial eights, while he materially assisted in working his college boat to a place higher up the river than it had ever attained before." Mr. Hyne is a great traveller, and knows Africa extensively. Concerning Captain Kettle we read:—

It was on his journey home, sailing from New Orleans on a tramp steamer, that he met the redoubtable "Captain Kettle," though not of that name. Passengers not being permitted on that kind of craft, Mr. Hyne had to sign articles before the Consul as doctor or mate, and so as one of the crew Mr. Hyne ran the risk of being shot by the fiery little skipper like any other of his shipmates. But Mr. Hyne's Captain Kettle of his famous "Adventures," he admits, is somewhat of a composite creation, embodying the brave spirit, the foul-mouthed imprecations, and the Methodism of the captain with the accordion-playing of the engineer and the poetical effusiveness of the fourth mate.

We like Captain Kettle (says the "Academy and Literature") but we can never quite forgive Mr. Hyne for depriving him of a leg.

✧ ✧ ✧

As is well known, Mr. Spencer has never enjoyed very robust health. In early life he was told by his physician that his health would never improve while he worked so hard and lived alone in lodgings. From the sixties onwards he resided in a boarding-house at 37 Queen's Gardens, Bayswater:—

His recreations now became varied and of inestimable benefit. When lawn-tennis was revived he took it up eagerly; he was always ready to join a picnic or an excursion, when he was as active and sportful as the youngest. He often went to the theatres and the opera, usually in company of friends. He set much store on his annual outing in Perthshire or Argyllshire, where he fished for salmon with the thoroughness which went into everything that he did. His flies were always of his own design. Indoors when in London, to get through the long dull evenings when he had no engagements, he played whist at first and then billiards. He often dined out, steady rather than brilliant. He often dined out, less from choice than for the sake of distraction from toil.

When recovering from a serious illness in 1878, Mr. Spencer dictated his autobiography to an amanuensis, sitting under the trees of Kensington Gardens.

✧ ✧ ✧

To promote the "entente cordiale" seems to be the laudable secondary object of the bilingual "Weekly Critical Review," the first number of which has just appeared in Paris. The Editor is Arthur Bles, who has obtained the names of some very distinguished contributors. M. Huysmans contributes a sketch; M. Bourget promises another for No. 2; M. Louis de Fiucard sends some very interesting notes on Flaubert. Two-thirds of the paper is written in English.

✧ ✧ ✧

By the death of Miss Ada Ellen Bayly, the "Edna Lyall" of many title-pages, we have lost a writer who at least had earnestness and a reasonably healthy outlook. As literature her books had no great value; they were diffuse and marked by no strong characterisation. Yet "Edna Lyall" had the narrative faculty, and her stories have a freshness which is not so common that we can afford to pass it too lightly by. The problems of "Donovan" were just such problems as cannot be treated in fiction with much actuality; at the same time, their appeal is so wide that books dealing with them are almost sure to be read. The details of Miss Bayly's life give no particular points for comment: she had the usual ups and downs of the literary career, and when "We Two" was published its success came as the usual surprise. Miss Bayly did her best honestly; she interested many thousands of readers, and did none of them any harm, which, after all, is a record of which any writer might be proud.

✧ ✧ ✧

The "Monthly Review" prints, under the not very happy title of "A Morning's Work in a Hampstead Garden," an article by Mr. Sidney Colvin concerning Keats's Nightingale Ode. The autograph draft of the poem was given by Keats to his friend, John Hamilton Reynolds; then it passed to Reynolds's sister, and through her to her two sons, Charles and Townley Green. The manuscript came up for sale at Sotheby's not very long ago, and was bought by the Earl of Crewe "at no extravagant price." The document is reproduced in facsimile in the "Monthly Review," and Mr. Colvin says concerning it, "that we have in it Keats's true and original draft of the poem is certain." On which hypothesis he proceeds to point out certain trifling inaccuracies in Charles Brown's record of how and when the ode was written. But we fail to see how Mr. Colvin arrives at his certainty. The manuscript reproduced, as far as its own evidence goes, might very well be a second or third draft. Brown said that the ode was first written on "four or five" scraps of paper; the manuscript in question covers only two half-sheets of notepapers. In absence of further evidence, we should be inclined (says "The Academy") to assume that Brown was right, and that Mr. Colvin's assumption as to this being a first draft, wrong. The matter is of no great importance, but it suggests the necessity of caution in such inquiries. The emendations and cancellings in the draft are of great interest, but for these readers must go to Mr. Colvin's article.

✧ ✧ ✧

In an article in the "New Liberal Review" on Lady Gregory's "Poets and Dreamers," Mr. W. B. Yeats contributes some thoughts of his own to the question of the possibilities of Irish nationality and the revival or creation of an Irish literature. Concerning these Galway people, he says—"I do not think imagination has changed here for centuries, for it is still busy with these two themes of the ancient poets, the sternness of battle and the sadness of parting and death." These two themes are, of course, universal, the more primitive the people the stronger being their hold. Later Mr. Yeats says:—

There is still in truth upon these great level plains a people, a community, bound together by imaginative possessions, by stories and poems which have grown out of their own life, and by a past of great passions which can still stir them to imaginative action. One could still if one had the genius, and had been born to Irish, write for these people plays and poems like those of Greece. Does not the greatest poetry always require a people to listen to it? England or any other country which takes its time from the great cities and gets its taste from schools and not from old custom, may have a mob, but it cannot have a people.

✧ ✧ ✧

A correspondent of the "Morning Advertiser," apropos of Mr. H. A. Jones's little difficulty with the "Times," has sent to the "Advertiser" particulars of "a wordy protest from the then (1876) manager of Drury Lane Theatre against adverse criticism," which, in that case also, had appeared in the "Times." Mr. Chatterton, the manager, admitted that critics usually treated him with fairness, but that the "Times" had fallen foul of "Richard III." without warrant. Nine years before the "Times" had said that Mr. Barry Sullivan would soon "be acknowledged as the leading legitimate actor of the British capital"; the later critic (or was he the same?) sneered at Mr. Sullivan as "an actor high in favour in America, and on our own provincial stages, but less known, perhaps, in London." And now we have the old story all over again, only in the modern instance it is the author and not the actor who considers himself aggrieved. Well, perhaps we should be grateful to Mr. Jones for a certain amount of mild amusement.

SCIENTIFIC TOPICS.

On the shores of Prince William Sound, Alaska, a cave was recently discovered which contained fourteen wooden canoes with a mummy in each. Stone slabs covered the canoes. A number of stone implements were also fonnd there. The natives who live in the neighbourhood had no knowledge of the cave and its contents, nor any tradition concerning the remarkable find.

✧ ✧ ✧

The sand-blast as a substitute for soap, water, and scrubbing brush is a novel idea, but this has been used recently in the renovation of the Government Printing Office and the Treasury Building at Washington. A Chicago company has had a portable plant built for the purpose, and engages in the business of cleaning the fronts of marble building in all parts of the country.

✧ ✧ ✧

The contractor for the New York rapid transit subway recently stated that, owing to the great developments in electrical art, a generation of electricity is now only three years. This is a startling announcement, and sets one to thinking. What becomes of all the old machinery, and who pays for the new? How long will it be before a company can install a plant and feel assured that the machinery will not have to come out within a year or two?

✧ ✧ ✧

Physicists never tire of efforts to increase the accuracy of their knowledge of the fundamental facts of science. A re-determination of the velocity of light by the Fizeau toothed-wheel method described in school text-books has just been completed at the observatory of Nice. The new experiments are remarkable on acount of the great distance over which the beam of light employed was transmitted. Previously such a beam had been caused to travel about 15 miles, but on this occasion the reflecting mirror was so placed that the total distance traversed by the beam, going and returning, was 57 miles. The mean of 1,109 observations gave for the velocity of light 186,225½ miles per second.

✧ ✧ ✧

A year or so ago, when Professor Pupin's invention of a system of inductance coils by which ocean cables could be transformed into telephone lines was announced, many apparently thought that talking across the Atlantic would soon become an accomplished fact. But the question of cost and technical difficulties seem to have stood in the way. Now, however, it is reported that Berlin capitalists, who have acquired rights in the invention, intend to push its application between points on the shores of the Mediterranean, the Baltic and the North Seas. Direct telephonic communication between Berlin and London, and Berlin, Copenhagen, and Stockholm, by the aid of this system, is regarded as feasible.

✧ ✧ ✧

News comes from Worcester, Mass., that the Morgan Truck Company has completed and tested with success the largest automobile ever completed. The vehicle has a capacity of ten tons to a load, and is built entirely of steel. The motor used is a steam engine. The boiler is of the torpedo water-tube type. The automobile is so constructed that two or three loading bodies can be used, removing the trucks and running gear and placing them under another body, thus saving an enormous amount in time and expense of loading. The big cranes are attached to the truck, operated by the engine, capable of lifting the largest steel beams or granite blocks. The total daily capacity of the truck is estimated at 400 tons.

✧ ✧ ✧

A most interesting and practicable application which has been made recently of this property of aluminum is found in the experiments of M. L. Guillet in the preparation of alloys of aluminum. By mixing the aluminum powder with the oxide of other metal desired in the alloy, and igniting the mass in a crucible, the combustion of a portion of the aluminum furnishes heat to reduce and fuse the remainder of the charge, the result being a metallic alloy of the metals present. In this manner some results have been obtained which may prove of material industrial importance. Especially noticeable are the alloys of aluminum and nickel, and of aluminum and cobalt, these exhibiting an extremely high degree of strength and hardness.

✧ ✧ ✧

The long-distance automobile race on the Continent this year will be from Paris to Madrid—a distance over the route chosen of 531 kilometres, or 329¾ miles. The race will be run on three successive days—May 24, 25, 26,. Among the French manufacturers who have entered machines are the following:—Mors, 10 cars; Panhard-Levassor, 12; Renault Freres, 10; Dietrich, 9; Decauville, 4; Ader, 8. The manufacturers of the German "Mercedes" car have entered 6 machines; the makers of the Belgian "Pipe" machines have entered 4; England will be represented by Edge and Jarrott on Napier cars; and America by 2 Matheson machines, built by the motor car company of that name, Grand Rapids, Mich, and by H. S. Harkness and W. K. Vanderbilt, Junr., who will drive special cars which they are having built.

✧ ✧ ✧

If your eyesight is good, take care of it. Look away off yonder every time you get to the bottom of a page in reading. If it is defective; let no foolish pride prevent you from wearing the proper glasses. There is no sense in your handicapping yourself in life when a piece of glass before each eye will make your vision as good as it possibly can be. The occulist will not advise you to wear glasses if you do not need them any more than he will prescribe a drug you do not need. Plenty of people, though, do not know that they have defective sight because they have never really seen at all. They have headaches, inflamed eyes, sties, even much graver troubles, from the strain of trying to see with eyes that were put up wrong. There are cases where homicidal insanity has been completely cured when impaired vision has been corrected.—Harvey Sutherland in "Ainslee's Magazine."

✧ ✧ ✧

A test has been made at Montreal of a device to check the speed of vessels in an emergency. The device consists of fins, controlled from the wheel-house, which open at right angles to the vessel's side. The experiments were made with the Government steamer "Eureka," 103 feet long, 22 feet wide, and 200 tons capacity. The fins were ten feet long and 3 1-2 feet wide, made of three-eighth inch boiler plate. To hold the fins at right angles there are water cushions worked by rods and pistons from the fin. The cylinders in which the pistons work are four in number, each thirteen inches long with five inches of water pressure, and when the boat was running eleven knots there was no jar when the apparatus was applied. By using one fin only a vessel may be swung upon her own axis. Under a speed of eight miles an hour the "Eureka" was brought to a full stop in her own length when the fins only were used, and in half her length when the engines were reversed.

✧ ✧ ✧

Owing to the great advance in the cost of sponges during the last few years, due to the scarcity and results of overfishing and increased demand, the packers in Florida have resorted to "loading" sponges to keep down the prices, so as to appear to continue asking the former prices, whereas, in reality, the cost is twenty to thirty per cent. higher. There are several methods of accomplishing this, such as injecting into the sponge sand and marble dust; also by washing the sponges in a salt solution or by injecting glucose and heavy syrups. To compare the difference between a pure and loaded sponge, take a two-ounce spunge of each grade, wetting them both, and it will be found that the pure article will measure about nineteen inches in circumference or thereabout. The loaded article in comparison will only measure about sixteen inches in circumference and less.

✧ ✧ ✧

A sponge in its natural state is a different looking object from what we see in commerce, resembling somewhat the appearance of the jelly-fish, or mass of liver, the entire surface being covered with a thin, slimy skin, usually of a dark colour, and perforated to correspond with the apertures of the canals commonly called "holes" of the sponge. The sponge of commerce is in reality only the skeleton of a sponge. The active part of the sponge, that is, the part concerned in nutrition and growth, is a soft, fleshy mass, partly filling the meshes and lining the canals. It consists largely of cells having different functions; some utilised in the formation of the framework, some in digestion, and others in reproduction. Lining the dilated spaces into which different canals lead, are cells surmounted by whip-like projections. The motion of these projections produces and maintains the water-currents, which carry the minute food-products to the digestive cells in the same cavities. The eggs, which are called larvae, pass out into the currents of the water, and, in the course of twenty-four to forty-eight hours, they settle and become attached to rocks and other hard substances, and in time develope into mature sponges. The depth of the water in which sponge grows varies from ten to fifty feet in Florida, but considerably more in the Mediterranean Sea.

✧ ✧ ✧

The "Chicago Chronicle," in one of its recent issues, published an account of the introduction of the telephone into Europe. It seems that at a banquet recently given in Chicago for telegraph and telephone operators, Mr. Fernando Jones made a speech in which he told an anecdote which reflects upon the "Scientific American" no little credit. Mr. Jones stated that he saw and used the first telephone instrument ever made in Europe. "It was in Florence, and in the studio of Preston Powers, a son of Hiram Powers, the sculptor. It came about in this way: One day the mail brought to Mr. Powers a copy of the "Scientific American," which contained an account of a new and marvellous invention called the telephone. In the account were diagrams and particular descriptions, all of which Mr. Power, who had a fine mechanical talent, understood almost at a glance. I then left the city for a short trip, but after a week's absence I returned and called again up my friend. He said he had a wonderful thing to show me. Then leading me into a small room just off the studio, he pointed to a box that was set on another and larger one. It was a rude enough thing, but it had attached to it a tube with a mouthpiece and another tube that was adapted to the ear. There was a wire which extended from the box through the board partition of the little room, and I presently learned that it passed out through the window of the studio and up to his wife's drawing-room in his house. This house was situated on the Porta Romana, and the studio was some five hundred feet below it. Now I was for the first time to see the telephone used. 'Mr. Jones,' he said, 'I am going to ask you to dinner this evening, but first I will telephone my wife that you are coming.' This he did, and the answer came quick, clear, and cheery, 'All right.' That was the only telephone then in Europe, and when I had returned to the United States, there probably were not a dozen in any American city."

GLIMPSES OF THE PAST.

(From the Dublin Newspapers of 1787.)

LONDONDERRY, OCTOBER 9.

In consequence of the very frequent robbery of the mail, the people of Cork, Belfast, and some other towns, have petitioned the Government to establish mail coaches, a measure which, we hope, may be carried into execution in this part of the kingdom also. In the meantime, a stage coach is to run between Strabane and Armagh the beginning of next month; this is a laudable scheme, and deserves the best encouragement of the public, as it will essentially improve our communication with Newry and all the towns upwards.

Two gentlemen of the army last Friday morning started from the barracks of Dublin; the first who entered into the walls of Derry was to gain 200 guineas from the other. One of the gentlemen accordingly arrived here on Saturday about one o'clock, having preformed the journey in 29 hours and a quarter on one horse. The other gentleman did not appear here at all; it is supposed his horse failed him upon the road.

BELFAST, OCTOBER 11.

A meeting of the Sovereign, and inhabitants of the town, was held at the Market-house on Tuesday last, to consider of the most effectual means to establish a Town-guard for the ensuing winter, it seeming to be the general wish of those gentlemen present who were Volunteers, that they should take an active part as usual, in the patrol of the streets, it was unanimously resolved that the Volunteers, and those other inhabitants who are not Volunteers, should take the care of the town upon them every fortnight alternately. With respect to mail coaches, it was the unanimous sense of the meeting that the establishment of one to run between this town and Dublin would be highly beneficial to the community, and was indeed a measure become absolutely necessary, on account of the late frequent robberies of the mail. It was, therefore, unanimously resolved that the Sovereign be requested to have a petition drawn up expressive of the above purpose, signed by him in the name of the inhabitants, and to be forwarded to his Grace the Lord Lieutenant as soon as possible.

DUBLIN, FRIDAY, OCTOBER 12.

On Wednesday protections were delivered by order of the Government to the several Captains of his Majesty's Holyhead packets.

I a short time, at least in a series of five or six years, this metropolis will possess several advantages not enjoyed by many other capitals in Europe—the interrupted continuation of its quays from the extreme of the western part of this city to the channel in the harbour, with good embankments on each side, and adorned with spacious edifices and elegant houses, mostly belonging to merchants, may be a circumstance very naturally anticipated. In short, this city will become the admiration of foreigners, who will be, no doubt, led by a laudable curiosity to pay it frequent visits.

Monday evening, so early as six o'clock, Mr. Rooney, of the county of Meath, was stopped near the wood of Corduffe, on Trim road, by a gang of seven fellows, well armed, who threatened instant death on the least outcry. After obliging the gentleman to dismount, they searched his pockets, and even ripped the lining of his clothes, but only found sixteen shillings and some brass, with which they ran off on the noise of an approaching carriage.

DUBLIN, TUESDAY, OCTOBER 16.

Yesterday, at one o'clock in the afternoon, a meeting of the principal artists in this city was held at the Royal Exchange, for the purpose of establishing a Museum in this city, for the display and encouragement of the arts and manufactures of this kingdom, when they came to some spirited and proper resolutions, formed a committee, and appointed a second meeting for Friday evening next, at seven o'clock, to be held at the Royal Exchange. The intention of this undertaking is to have a place where all description of ingenious productions of this kingdom shall be received, and daily exhibited to the public, gratis.

By the Revenue Act of last Session it was enacted, that all persons dealing in tobacco or retailing spirits, should make a quarterly return of the stock they have on hand, or forfeit the same, this having been neglected for the last quarter, upwards of £20,000 worth of tobacco was seized in the different shops of the city last week.

A grant, we hear, of five thousand pounds will be made the next Session of Parliament in aid of the works carrying on in our harbour.

On Saturday night last, between the hours of eleven and twelve o'clock, a gentleman was stopped at the top of Winetavern street by three footpads, armed with pistols who forcibly dragged him into the entry of the house at the corner of John's lane, where, after robbing him of five guineas in gold, a few shillings in silver, together with his hat, shoe, stock, and knee buckles, they gave him several severe strokes on his head, and, leaving him senseless in the entry, got clear off with their booty, before the gentleman could sufficiently recover himself to alarm the neighbourhood. One of the villains, however, from the gentleman's description, being well known, it is hoped he and his associates will be brought to justice.

Last Saturday the Rev. Mr. Crawley, Minister of Kilgobbin, in the county of Dublin, with two or three persons in his company, having gone into the remote parts of the mountains, situate in that parish, to look after some tithes, although within so small a distance of the metropolis, a new scene of Whiteboyism took place. The inhabitants of those difficult and rugged places being apprised of that gentleman's visiting them, upon his getting among them, began the attack by sounding several horns, which were as speedily answered by others, in order to spread the alarm from place to place, and gather the greater multitude together, when prodigious numbers of women and girls, of all ages, assembled, and vast numbers were seen tripping over every hill; the Male Mountaineers, lest they might be punished for a breach of the laws, withdrew themselves from the battle, and left the matter to those robust Amazons, who committed hostility with such a desperate shower of stones, as instantly threw the opposite party into the utmost disorder and confusion, and made them give way; and the assailants having very warmly pursued their advantage, obliged them to seek their safety very precipitately, by flight, through the bogs and morasses, etc., etc.; and the assailed, in their way, having every now and again, met with fresh assailants, they were desperately wounded and bruised, and with very great fatigue and difficulty, narrowly escaped being stoned to death. The life of one man, however, who stuck in a bog, and was taken prisoner, is despaired of. Luckily for Mr. Crawley he was mounted, who being an elderly gentleman, must otherwise have fallen a victim to the savage ferocity of those rustics, who pursued him so closely, and with such agility for about five miles, through the deep glens, and over the high and rocky hills and precipices, which those parts abound with, that he was constrained to take bogs, stone-walls, ditches, and morasses, as they presented themselves in his way; and after a desperate chase, happily escaped his numerous and agile pursuers, not without slight contusions, however, which he received from some of the stones that were thrown, and himself and his horse very much harassed and fatigued. This outrage committed on Mr. Crawley is the most reprehensible, as it was altogether unprovoked and undeserved, that gentleman having never farmed out his tithes, in said parish; but, on the contrary, has heretofore accepted of whatever the parishioners were willing to pay him, although it never amounted to one-half, if a third, of his dues.

DUBLIN, TUESDAY, OCTOBER 16.

Last week a beautiful pleasure boat and a new yawl, built by Mr. Wilithorne, near George's quay, was led through the city to Mr. Dillon's house in Fortick's lane, thence to be brought to his seat in Connaught; it was placed on a low four-wheeled cariage, constructed for the occasion, but which can also be used for the conveyance of corn, hay, timber, or any cumbrous materials.

The villain who robbed Mr. Abbot, of Drumcondra, was whipped from Kilmainham through the Circular Road to the place where he committed the robbery. The serving on board a ship of war being proposed to this hardened offender, he chose to undergo the lash; and as there is no doubt of his future ill designs, it would render the public a benefit to impress him into the sea-service.

DUBLIN, THURSDAY, OCTOBER 18.

A general idea being conceived, that nothing would so much contribute to the civilisation of this country as the establishng of Mail Coaches, it is much to be wished that the Postmasters-General would mature some effectual plan for that purpose. Hitherto the impassable state of the great roads has baffled every idea on this subject.

A correspondent remarks that if an additional tax of one penny for fifty miles, and another penny for eighty miles and upwards, were laid upon all single letters, etc., it would be the means of enabling the gentlemen at the head of the Post-Office to devise some effectual plan for the acceleration and safety of correspondence, now become so very precarious from the numerous robberies which have been committed of late. And if, on the part of the Postmasters-General, they were to propose to the several Trustees of Roads, to pay a certain sum of money early, in lieu of turnpike-tolls, which, in case the additional tax was adopted, should be a liberal one: then all impediments would cease: the Trustees would be enabled, with this additional aid, to cause good roads, and make this very desirable measure become equally useful as in the sister kingdom.

Another correspondent remarks that the mode of fencing the roads in this country is a very dangerous obstacle to the establishing of mail coaches, which must of necessity travel by night with equal speed as by day, deep ditches being cut at each side of the road, and the embankment thrown in upon the fields. Whereas, in England, they are the very reverse, the ditches being uniformly, to the field, and the embankment to the roadside. This is a subject for the consideration of such gentlemen as, wishing the prosperity and improvement of their country, take the trouble to inspect the making of public roads through the kingdom.

(To be continued.)

RATES OF SUBSCRIPTION.

"DUBLIN PENNY JOURNAL."

Post-free to any part of Ireland, Great Britain, Australia, New Zealand, Canada, United States.

Twelve months, 6s 6d; Six months, 3s 3d; Three months 1s 8d.

Printed and published for the proprietors at 90 Middle Abbey street, Dublin, by W. F. Dennehy, to whom all cheques and money orders should be made payable.
